CIRCULATES EVERYWHERE IN CANADA

4090

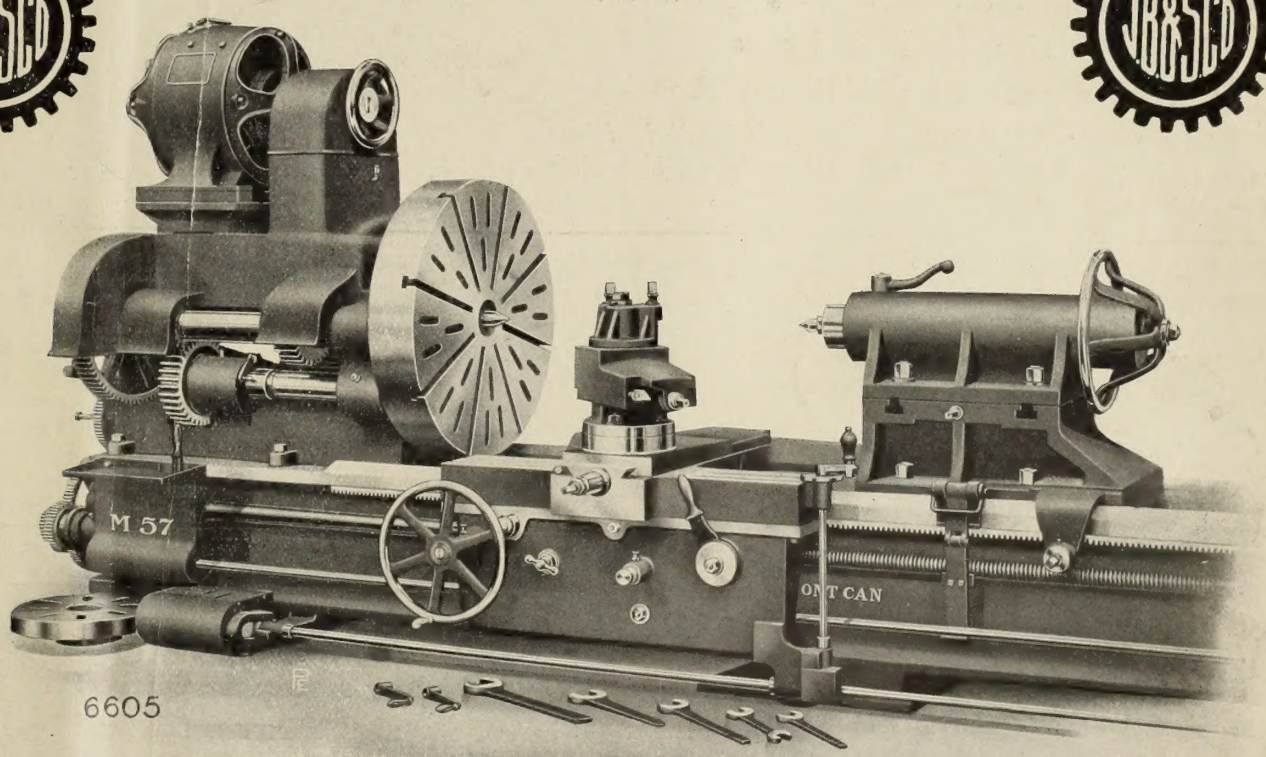
CANADIAN MACHINERY AND MANUFACTURING NEWS

A monthly newspaper devoted to the manufacturing interests, covering in a practical manner the mechanical, power, foundry and allied fields. Published by The MacLean Publishing Company, Limited, Toronto, Montreal, Winnipeg, and London, Eng.

MONTREAL Eastern Townships Bank Bldg. TORONTO, 10 Front Street East. WINNIPEG, 511 Union Bank Building. LONDON, ENG., 88 Fleet Street, E.C.

Vol. VI. Publication Office: Toronto, January, 1910. No. 1

Bertram Engine Lathes



Bertram 42-inch Triple Geared Engine Lathe---Motor Driven

Write for photographs and particulars of any sizes required.

Sales Agents: The Canadian Fairbanks Company Limited. Offices: Montreal, Toronto, Winnipeg, Vancouver, Calgary St. John

A Revolution in Surface Reduction

The P. & W. Vertical SURFACE GRINDER

The New Method of Surface Reduction that is Rapidly Displacing Milling and Shaping Operations

10 to 25 times faster than milling.

Produces an absolutely flat surface with a mirror finish and grinds uniformly to within 0.0002 inch.

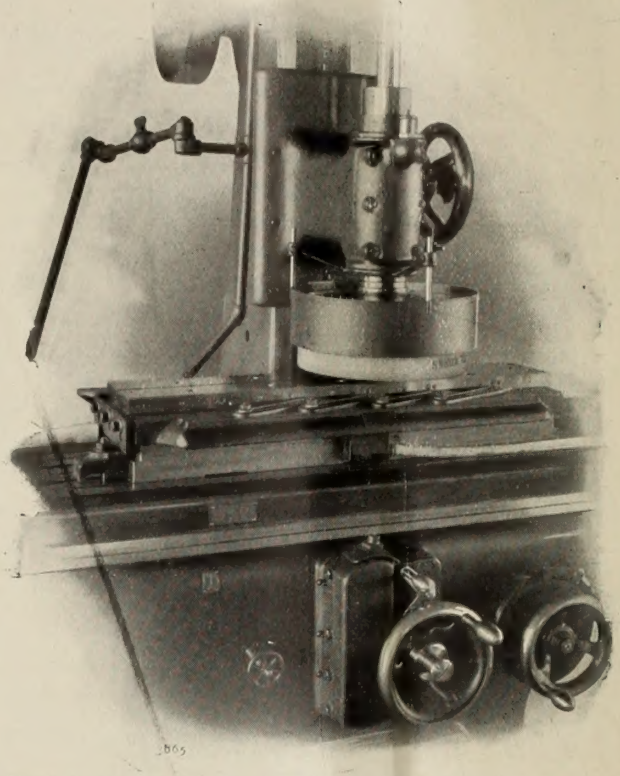
Works directly on the rough and hardened forging or casting.

Overcomes all surface errors that were impossible to correct in milling or shaping operations.

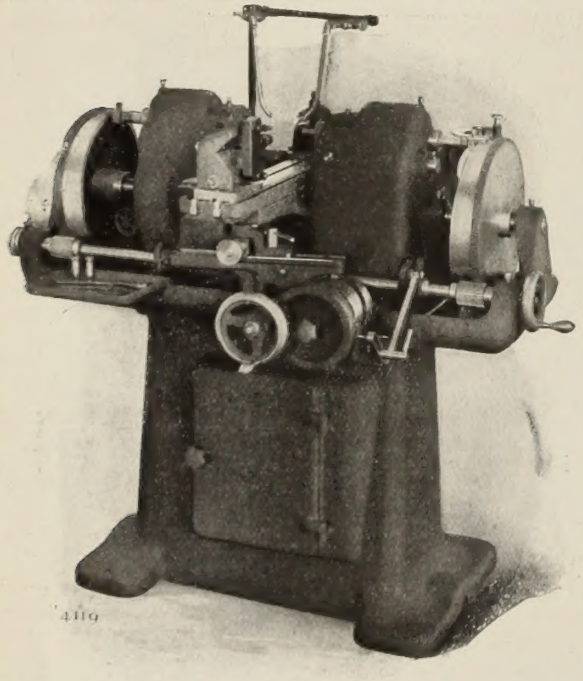
Working surface 10¾ x 36 inches.

"Grinding, not Milling" is the new shop slogan.

Write for book "Grinding, not Milling," it illustrates over 75 economical applications in all branches of machine manufacture.



Partial view of the P. & W. Vertical Surface Grinder showing cup-shaped grinding wheel and magnetic table.



P. & W. Spline Milling Machine

No More Trouble or Expense to Mill a Slot with a P. & W. Spline Milling Machine

Than to drill a hole with a drill press.

Cutters used are cheaper than drills.

To obtain a tang slot or key-way, a cutter, the diameter of which represents the width of slot desired, is placed in collet, table traverse set for length, and, in case of a key-way, the cams set to limit the depth.

Operation is entirely automatic.

Write for Catalog "Spline Millers."

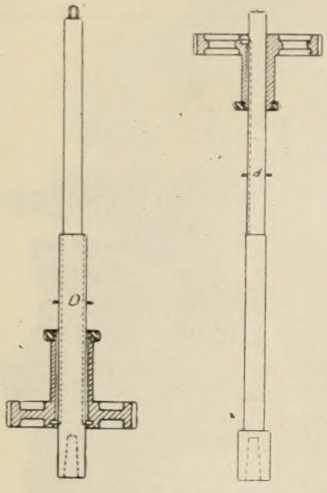
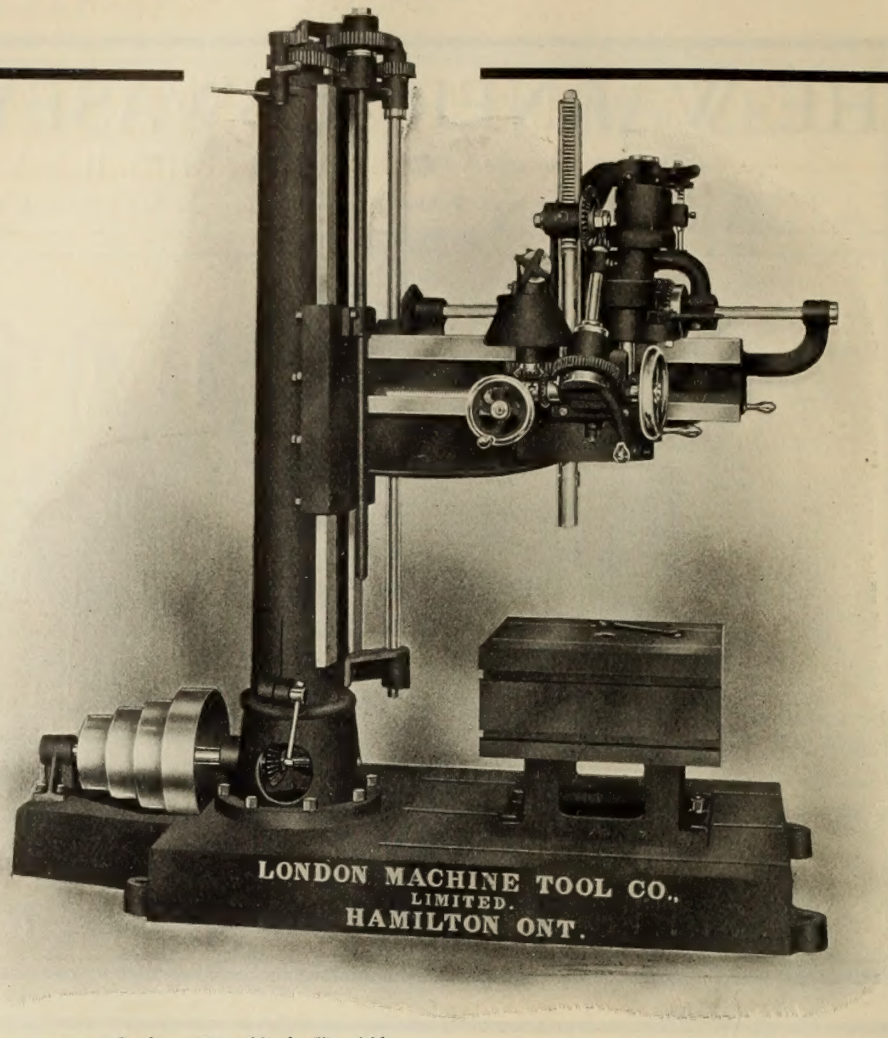
ALL FORGED STEEL CASE-HARDENED

Made by **TRIMONT MFG. CO.** *55 to 71 AMORY ST.* **Roxbury, Mass.**





3-ft. Radial Drill.

SUPPOSE you ordered *a Lathe* and when it arrived you found it was driven *by a gear* on the *farthest away point* on the spindle, away up where you go around to throw in your back gears—about *as far away as you can get* from the point where you want to deliver your power? Well, we will guarantee that when the lathe arrived you would *refuse delivery* even though the most reputable builder in the world stood behind it, and we think you would be quite right. When you buy a Lathe you want a Lathe with the *driving gear right up as close as possible to the nose of the spindle,* which is the point from which you have to deliver your power. We, *like all other makers,* have built Radials in just the manner that we have described, with the gear away up at the wrong end of the spindle, just as you see in the illustration "d." We woke up to the fact one day that we were entirely *on the wrong track,* and that Radial Drills should be built *exactly* the same as Lathes, putting the drive at *the lower end of the spindle,* as at "D," so we went to work and *re-designed our whole line,* and the results we have been getting from these Radials are *simply marvellous.* For instance, the 3-foot Radial, shown in cut, will drill 1-inch holes at the rate of 15 inches per minute. It will drill as high as 3-inch diameter and as low as ¼-inch diameter. It will bore cylinders as high as 12-inch diameter. It is *rigid in construction,* having very stiff base, and stiff arm and double column, the inner column running clear through to the top. It is *accurate,* the *highest grade* of workmanship only being put on the machine. It is *convenient* and *easily handled.* All levers are within *easy reach* of the operator. The back gears are *thrown in and out* while the machine is *in operation,* and is started, stopped and reversed by levers right in front of the machine.

In all points whereby a Radial Drill is judged, this Drill stands without a peer to-day. We are building these in *large quantities* and can make *delivery from stock* in 3, 3½, 5 and 6-foot sizes. The prices are *reasonable.* It is yours and a lot of other information *for the asking.*

We make also a *very complete* line of *Iron Working Machinery* of *highest class,* in *Planers, Lathes, Boring Mills, Shapers, Punches* and *Shears, etc.,* and any information on any of these lines will be *cheerfully furnished* on application.

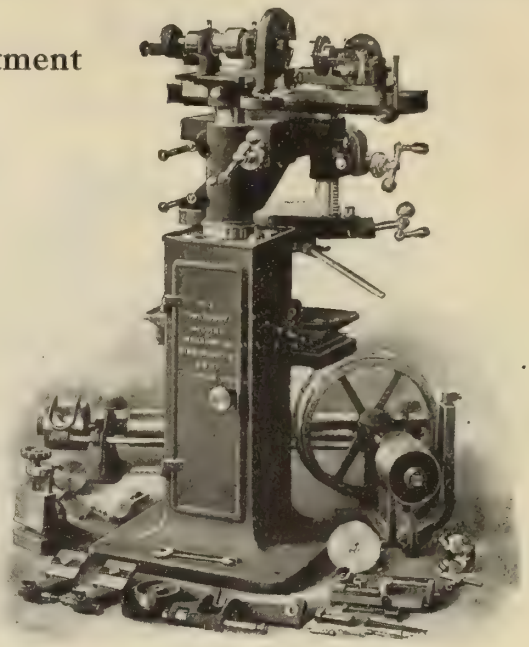
Cincinnati Cutter Grinder Improvements

Taper Gib for Adjusting Slide
More Substantial Stop Dogs with Fine Adjustment
Stiffer Knee



A FEW IMPORTANT FEATURES:

Knee Swings About Column to Any Angle
and table swivels about fixed centre on slide bringing work into any desired position to emery wheels.

Graduated Dials
on all swivels and adjustments.

A Quick Lever Feed
for sharpening cutters and also a slow screw feed for other work. Uses CUP-SHAPED WHEEL for sharpening cutters.

Has Micrometer Elevating Device
for setting cutters or reamers for desired clearance—and on this depends the successful working of these tools.

Some Things it Will Do
It will sharpen all manner and shapes of cutters, reamers, etc. Will do internal cylindrical, surface, angular and face grinding.

It Will Save You Money.
because it will sharpen cutters, reamers, etc., correctly and quicker than any other similiar tool. It is simple and convenient to operate. Any boy can run it.

THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

Let us send you more particulars.

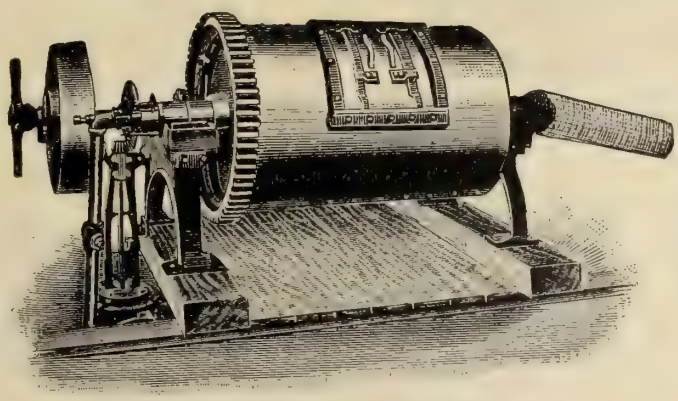
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. **Patented, No. 841728.**

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

From Editor to Readers

WITH the January issue, 1910, begins the sixth volume of Canadian Machinery. The editors have been busy making plans for this year and are able to announce some excellent articles to be given during 1910.

The passing of the fifth milestone in the life of Canadian Machinery is celebrated by giving a history of the advances made in machine tool design in Canada within the past five years. Canada is young in the machine tool line, but the demands are increasing with the great railroad expansion and an almost unlimited field for machine tools is opening up.

The articles under preparation for this year are brimful of good ideas and you will find them pretty good diet, well worth digesting, and good food for study and thought.

The following few articles are fairly representative of the class of articles prepared for the readers of Canadian Machinery during 1910:

First Aid Work on a Great Canadian Railroad

From time to time Canadian Machinery has given space to articles on methods for eliminating accidents in the works. Accidents will happen, however, and the method of dealing with them, described in this article, has received the commendation of manufacturers, Governments and King Edward, H.R.H. the Prince of Wales, being president of the association whose work is described. This method can be adopted by any manufacturer whose workmen will interest themselves in the work. This article will appear in the February issue.

Some Different Compensation Measures for Workmen

In the March issue will appear the laws in the various provinces of Canada and Great Britain for the compensation of workmen. The article will deal with the subject fully, giving comments on the various laws, their application and information in regard to factory accidents, etc.

The Molding Machine in the Machine Tool Foundry

This article is by John Edgar, well known to Canadian mechanical men. The subject is one which Mr. Edgar has studied and will give suggestions which will apply to other foundries than those devoted exclusively to machine tools.

High Speed Tool Steel

At the present time the possibilities of high speed steel are not known. The article by Samuel K. Patteson on this subject tells what can be accomplished by its use. It will appear in an early issue.

Other Articles to Appear During the Year.

Technical Education will receive even more attention than it has in the past. In each issue references to what is being done will be made, systems will be described and the whole subject of assisting mechanics will be treated.

Cost systems will also be given. Several good ones have come to the notice of the editors and will be given this year.

A great number of efficiency and mechanical articles of interest to proprietors, superintendents and foremen, including articles on grinding and milling, will be given. The "Methods and Devices" department is being greatly strengthened, and we are getting in closer touch with manufacturers to get descriptions of new and interesting tools placed on the market.

¶ **Remember**—This is only a foretaste of the good things we have in store for you. If you haven't subscribed yet, *Now* is the time, and you won't be disappointed. If you are a subscriber, tell your neighbor mechanical man about the good things to appear in Canadian Machinery in 1910 and that he should subscribe at once.

Canadian Machinery, 10 Front St. East, TORONTO

THE ESSENTIALS OF MACHINE ILLUSTRATING

BUYERS of half-tone plates of machinery are often puzzled and annoyed at the ineffectiveness of their illustrations, without being able to lay their finger on any definite weakness. A careful study of the above plate is a liberal education in what a cut should be, as it presents the embodiment of the principles of high-class engraving.

Note the strong, smooth tone of the cast iron frame, forming with its deep shadows a most effective background for the shining steel. See how clear, sharp and incisive is each working part, and how brilliant the gears, pulleys and polished rods. As a machine builder, doesn't the mechanical perfection of the whole plate appeal to you? Can you afford to go by us when estimating on your catalog?

The Packard Electric Co Ltd,
St Catharines,
Ont.

Dear Sirs;-

Re your enquiry about the S.H.P. motors which were purchased from you by the Department two years ago for operating the lock gate mechanism on the Welland Canal, I wish to say they have proven entirely satisfactory, and, notwithstanding the fact that the work required of these motors is extremely severe, I have had no occasion to incur any expense for repairs.

Yours truly,

Superintending Engineer.

FACTORY HEATING AND VENTILATION

BY

The Simplest and Most Economical System Known

The SHELDON FAN SYSTEM

CONSISTING OF

A Pipe Coil Heater, using exhaust or live steam, or both, which can be arranged for gravity return to a boiler located on the same floor.

A Blower, fitted with Sheldon Multivane Runner, which can be operated by any convenient power, most economically by a Direct Connected Engine, the actual operating cost of which amounts to only a small percentage of the heat in the steam passing through the fan engine. the remainder being utilized in the heater, into which the engine exhausts.

Fan, Heater and Engine are centralized in one compact apparatus.

The Fan can be so arranged to take all or any part of its air supply from outside or inside the building, as desired.

The warm air is conveyed through ducts or flues and distributed throughout the entire building.

Let us tell you more about it.

SHELDONS LIMITED, :: Galt, Canada

BELTING

vs.

INDIVIDUAL ELECTRICAL DRIVES

A concrete example:

Accurate modern determination of costs shows very plainly the irremediable expense entailed by high-priced installation and heavy maintenance charges.

In fitting up a certain repair shop all the money asked for was given to equip it with what was considered absolutely up-to-date machine tools and drives. There was not a belt in the shop. All machines, even the abrasive wheels, were driven by their own motors. The owners of the shop demanded as one of the charges 10% on equipment value for depreciation, and as 6% interest was allowed on first cost there was a total of 16% per annum for these two items. There were, in addition, the charges for power, almost double that which they would have been in a gas or oil-driven shop, and the charges for maintenance not only of machine tools but also of motors and electric installation. As a result, the total overhead charges amounted to $700 per month, of which $250 could be considered as due to the individual drive equipment. These $700 of charges had to be carried as a burden on five machinists, whose monthly working hours aggregated 1,000, the burden being $0.70 an hour. The wages averaged $0.40 an hour. The firm expected a profit of 20% and therefore had to charge $1.32 an hour for machine work.

Had this same shop been belt-equipped, the actual burden and wage cost per man per hour would have been $0.85, the total charge, including 20% profit, $1.02 an hour or 20% less than in a motor-driven shop.

If these two plants, the one electrically equipped, the other belt-driven, had been competing for the same work, if competition had forced the charge to $0.85 an hour, the belt-driven shop would neither have made nor lost, the motor-driven shop would have lost $0.47 on every hour of work. If the competitive price had been $1.02 the belt-driven shop would have made 20% profit, the motor-driven shop would have lost $0.30 an hour; if the charge price had been $1.10 the belt-driven shop would have made 0.25 an hour on each machinist, the motor-driven shop would neither have made nor lost; if the charge price had been $1.32, the belt-driven shop would have made a profit of $0.47 an hour, the motor-driven shop's profit would be $0.22, so that under all conditions the belt-driven shop is in a stronger, safer situation. Under all conditions of equal work and equal prices, the belt-driven shop is at least $2.00 per day per machinist better off.

Even if these differences were reduced one-half, to $1.00 per day; or to one-quarter, $0.50; or even to one-eighth, $0.25 a day, it must still be one of the most important factors about the business.

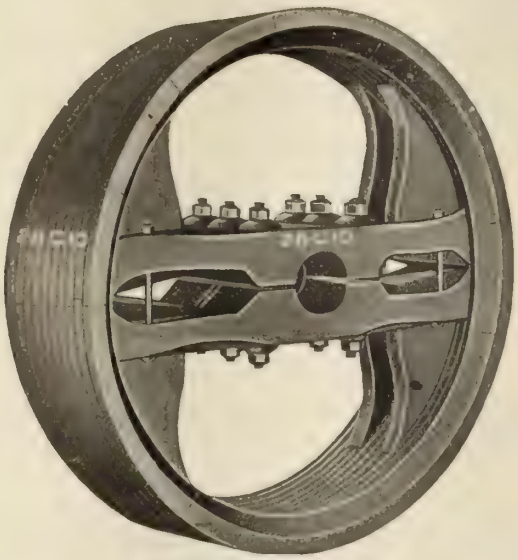
Let us Explain the Advantages of FAIRBANKS WOOD SPLIT PULLEYS



MADE IN CANADA

TAKE THIS OPPORTUNITY with us of comparing the various wood split pulleys on the market with the Fairbanks and see if our claims of superiority are not justified.

The construction of the arms and their connection to the rim is the vital point in all built up pulleys. The arms on the Fairbanks pulleys are actually built into the rim and form four segments in it. They are further stiffened and strengthened by four webs as shown, which are also part of the rim. This web construction is the strength of the pulley. The four webs together support two-thirds of the entire circumference, leaving only one-third which is not directly supported.

The rim is built up in sections, glued to one another and nailed with resin coated nails, which makes it impossible for them to work loose. This construction makes the FAIRBANKS PULLEY STRONGEST WHERE OTHERS ARE WEAKEST.

Advantages

THERE ARE TWENTY YEARS OF PRACTICAL EXPERIENCE BEHIND THE FAIRBANKS WOOD SPLIT PULLEY

The "FAIRBANKS" Wood Split Pulley has a place from which it can never be driven by either the steel or the iron pulley. It is light, strong and safe, and has the best belt adhesion of any pulley made. This enables belts to be run loose and so reduces strains on shaftings and hangers. They cost less than one-half as much as cast iron pulleys.

Five Years' Development of Machine Tools in Canada

By G. C. KEITH B.Sc.

Why five years?

Because within the past five years there has been an unprecedented development in Canadian railroads. The steel rails have been laid north, south, east and west. The building of the G. T. P., the expansion of the C. P. R., the miles of lines of the C. N. R. under construction and the inroads of other railroads have made a demand for larger and better tools.

Because motor drive is being used more in railroad and manufacturing shops; and because (and this is probably the chief reason) there has been the introduction of new high speed steel necessitating greater driving power, wider belts and a more substantial machine.

Canadian companies have shown themselves very progressive and have improved all their standard lines as well as increasing the number of machine tools manufactured. Others have devoted their time and attention to one line, improving it to give a maximum production. Besides carrying on experiments themselves, they have watched those being made by machine tool manufacturers of other countries. The result has been great improvements in Canadian-made machine tools.

Five years ago with carbon steel a very slow machine speed was satisfactory. The fact that machines have been developed to work at a speed from 2 to 5 times that speed according to the work, tells the story of how machine tools have been redesigned and more heavily constructed.

Planers have required a great deal of attention to make them stand up to their work. A few years ago, it was recognized that finishing cuts could be taken at a higher speed than roughing cuts, but now this is reversed. The introduction of high speed steel has brought about the reversal of conditions.

McGregor, Gourlay Shaper.

Rack driven shapers are subject to these conditions mentioned for the planer. Now a slotted arm is recognized as best because the speed is reduced at the beginning and end of stroke. Fig. 1 illustrates a McGregor, Gourlay Co. 16x20 inch shaper. It gives 8 changes of speed where 4 were formerly used. It is now considered essential to have automatic down feed of tool where formerly it was a luxury.

The machine illustrated in Fig. 1 is of modern design and stands up well when using high speed steel. The ram has square slides and is worked by an improved adjustable crank and slotted lever, the length of stroke being instantly set by a dial and pointer on the operator's side of the machine, the longitudinal adjustment is made quickly and positively by means of a double thread screw. The tool block slide has automatic feed up or down at any angle. The screw of this has a micrometer index graduated in thousandths of an inch.

The cross feed screw is also provided with micrometer index, and the feed stops automatically at either end of the slide, preventing breakages through carelessness.

McGregor, Gourlay Co. Lathe.

The 20-inch lathe illustrated in Fig. 2 is built for modern steel requirements with increased belt power and variety of feeds. In increasing the width and speed of belt, difficulties have arisen in shifting. To overcome this the McGregon, Gourlay Co. designed the permanent belt shifter shown in Fig. 2. This works easily and quickly. Another point is the feeds. A few years ago 3 changes were thought to be enough, but now 50 changes of feed are instantly available.

In the 20-inch lathe shown in Fig. 2 the cone is made with three steps, large in diameter, and takes an extra wide belt, which is changed by the shifter mentioned. There are two sets of back gears which with two friction pulleys on the countershaft give 18 changes of speed in geometrical progression, instantly available. For high speed work this is an entirely satisfactory arrangement, as it gives six changes of speed for finishing and small diameters at much greater power than has been furnished, direct on the spindle from the belt. Six changes through a back gear of low ratio for roughing at a high speed, and six changes through a comparatively high ratio, back gear for large diameter.

The feeds and screw cutting changes are instantly obtainable by the movement of a lever to the different positions given on the index plate. All the gears connected with this mechanism are made of steel, and whenever running on studs are bronze bushed. It is impossible to engage either automatic cross or longitudinal feeds

when the machine is cutting screws or vice-versa. The thread of the screw is used only for screw cutting. It is not necessary to reverse or stop the spindle when cutting screws as a dial on the saddle shows when to engage the nut. The feeds are instantly reversed in the apron by a movement of a lever. The saddle may be instantly clamped when cross feeding by a movement of a lever.

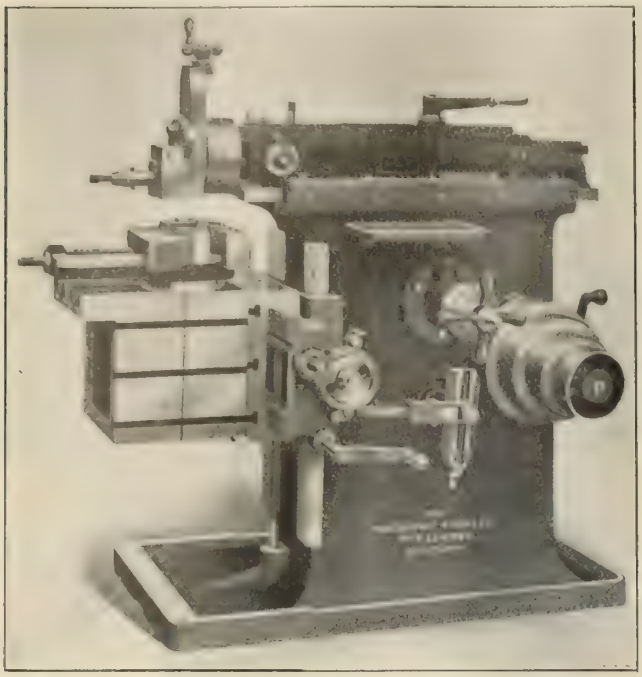

Fig. 1.—McGregor, Gourlay, Galt, Redesigned 16" Shaper.

Lathe cuts the following threads :
2, 2¼, 2⅜, 2½, 2¾, 3, 3¼, 3½, 3¾, 4, 4½, 4¾, 5, 5½, 5¾, 6, 6½, 7, 7½, 8, 9, 9½, 10, 11, 11½, 12, 13, 14, 15, 16, 18, 19, 20, 22, 23, 24, 26, 28, 30, 32, 36, 38, 40, 44, 46, 48, 52, 56, 60, 64.

R. McDougall Co., Lathes.

The R. McDougall Co., Galt, is giving special attention to lathes and in the past two years have redesigned them so that they now have a greater rigidity so that they are more suitable for high speed steels. The head has been redesigned to give a more even progression of speed. The cone diameter has been enlarged giving greater belt contact. The lathes now do from 2 to 4 times as much as previously in ten hours.

The headstock is well ribbed, closely fitted, and so clamped as to insure its non-chattering. The bearings are made self-oiling, having deep chambers for this pur-

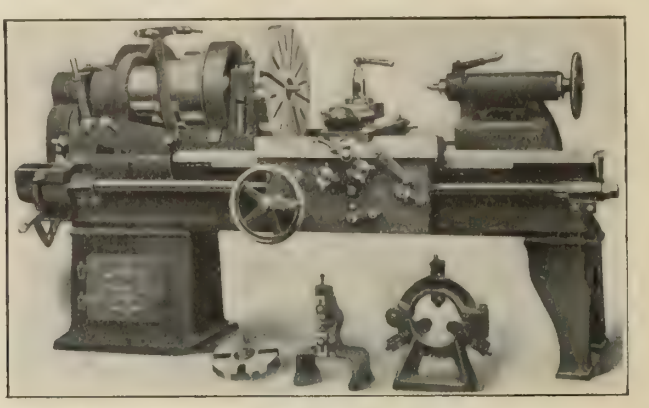

Fig. 2.—McGregor, Gourlay, Galt, Redesigned 20" Lathe.

pose and oil is fed to the spindles through a felt strainer which acts as a filter in clearing the oil. This filter should be renewed at least once a year and this will insure well lubricated bearings. Provision is made for return of oil

Fig. 4.—Bertram Interchangable Lathe Fitted for Motor Drive.

to chamber, thus making oiling of spindles automatic. This is one of the new features.

The carriage and apron have been redesigned with special reference to giving the maximum resistance to the springing and straining of these important parts of a lathe. The carriage has full bearings on V's its entire

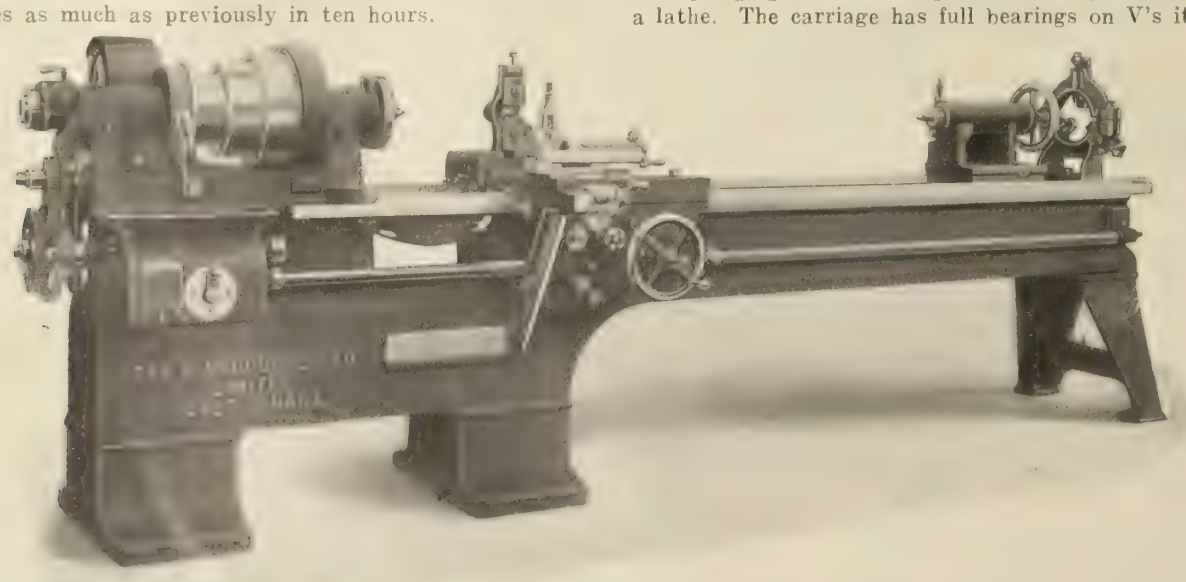

Fig. 3.—R. McDougall, Galt, Redesigned Gap Lathe.

length, has wide cross V reinforced with an extra amount of metal in cross bridge. The construction of the carriage and apron and their connection with rod and screw are so closely fitted as to prevent all tendencies to unevenness of motion or springing when under load.

The carriage brace is a special feature. This is a strong brace which is connected to the apron and slides upon a scraped and fitted way on the bed. The upper

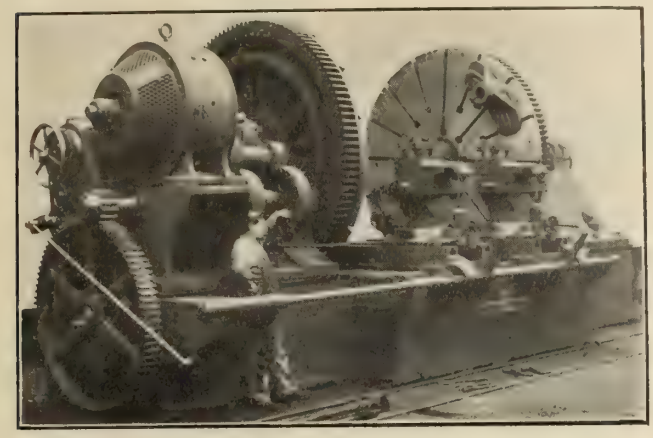

Fig. 5.—Bertram Locomotive Wheel Tire Lathe of Five Years Ago.

end is shouldered and this makes carriage very solid when working on gap diameters.

Double back gears are now used on their gap lathes and engine lathes when ordered. This feature is a very important one, especially on a gap lathe where a large range of diameters require to be treated. With two speed countershaft, as provided, 18 distinct spindle speeds are available, the ratio of advance being equal in each case so that no two speeds overlap. Through the first or low ratio gear a high spindle speed with a high belt velocity makes the lathe particularly efficient on rough and heavy cuts on small diameters, while the second or high ratio gear gives ample power for heavy

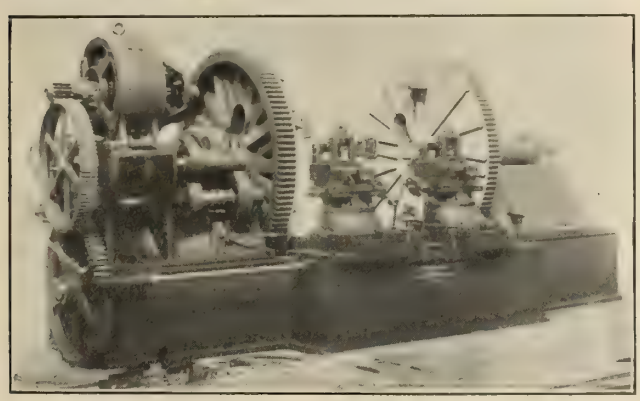

Fig. 6.—Redesigned Locomotive Wheel Tire Lathe

cuts on the largest diameters which can be swung in the lathe.

The lathes are all carefully tested, a test sheet record being kept and a copy is sent to the purchaser. The parts are made to accurate templets, and the lead screw is guaranteed being made to an exact standard master screw.

John Bertram & Sons Co., Dundas.

All lines built by John Bertram & Sons Co. have undergone redesigning. The drive on all tools, including lathes, planers, drills, etc., have been reconstructed. Planers are now built so that with the body of the planer can be placed in stock. When an order is received, it can be arranged for motor or belt drive as desired, or for square or parallel drive, by bolting on the proper attachments. A description of this new Bertram planer appeared in the September issue of Canadian Machinery.

The lathe shown in the heading is a belt driven lathe. Fig. 4 shows the motor driven lathe. The lathes are made convertible, belt drive or motor being attached after the body of the lathe is completed, accord-

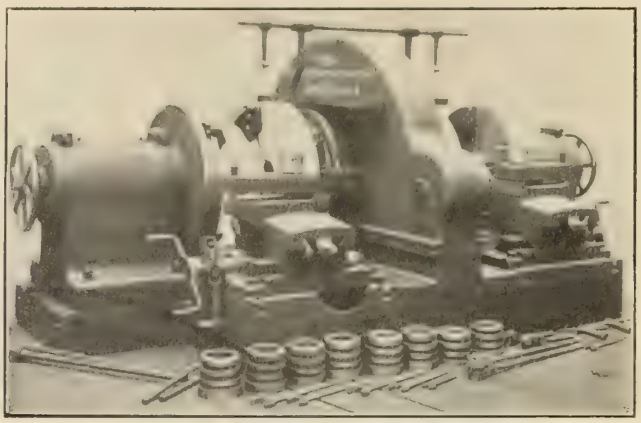

Fig. 7.—Modern Coach Wheel Lathe.

ing to specifications. In Fig. 4 the mechanism known as the "back gearing," is on the front of the lathe. Power is applied near the cut, taking the strain off the bearings. Massiveness is one of the features in the redesign of the lathe so that it stands well the strain of high speed steels.

Locomotive Wheel Tire Lathe.

Great advances have been made in railroad tools. In the Bertram locomotive wheel tire lathe several improvements have been made. Fig. 5 shows the old type

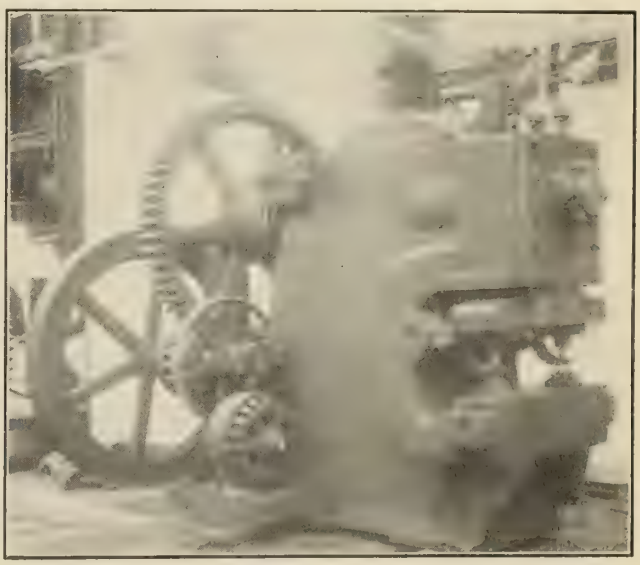

Fig. 8.—Redesigned Punch and Shears.

tool holder and method of holding wheel in place, while Fig. 6 shows the redesigned machine. In the first type the wheels were turned with an ordinary driver, now patent sure grip drivers are used, the wheel being chucked firmly to faceplate by the arms. This method is the invention of an expert of the Niles, Bement, Pond Co., and was patented in Canada by the John Bertram & Sons Co.

The tool holder used to require eight bolts and nuts but the new single screw tool holder shown in Fig. 6 reduces time. Production has now been more than

trebled, the output being increased from 3 pair to 9 and 12 pair per day.

Bertram Coach Wheel Lathe.

The coach wheels used to be driven in the coach wheel lathe from the face by boltheads, but now the same method as for tires is used. A single tool holder has also been adopted on this machine and the output has been increased from 5 or 6 to 15 pair per day.

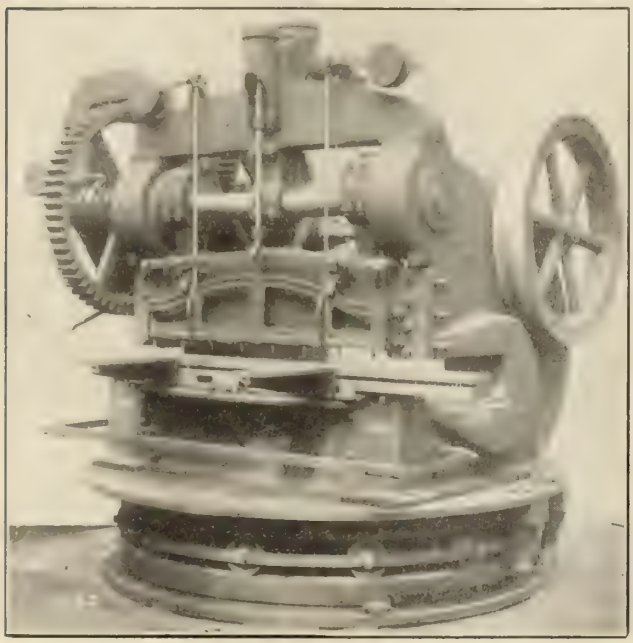

Fig. 9.—Improved Punch and Shears.

Fig. 7 shows a modern coach wheel lathe with single tool holder and modern chuch grips. This heavy tool has been developed to turn the high C. and Mg. steels. They must have great power, for on account of the climate and heavy grades, our railroads are more severe on rolling stocks than southern roads. The tires get tempered and the tools must remove these parts by cutting under the hardened parts, when truing up coach wheels.

Bertram Punches and Shears.

Punches and shears have been recently redesigned making them convertible for structural steel work. The

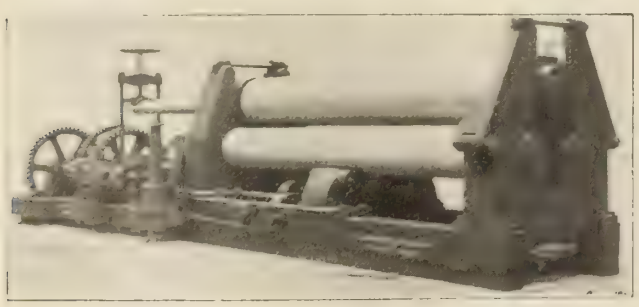

Fig. 10.—Motor Driven Plate Rolls.

one shown in Fig. 8 has a 40-inch face of ram for multiple punching. With it 12 to 15 holes may be punched at once. Formerly 8,000 holes per day used to be a good day's work, now 90,000 holes per day is considered a reasonable day's work.

Fig. 9 shows one of the latest shearing machines. Formerly the beams were worked by cams. This method was defective and when different thicknesses of plate were used, they were not clamped equally. When it clamped thin work it would not clamp thick plate.

The shears shown in Fig 9 are equipped with clamps operated by air cylinders, which give an equal pressure on all thicknesses of plate. Another late development, or perhaps it is an old method again adopted, is to use belt drive from the motor to the shears, as the jarring of the machine gave trouble with gears.

Angle shears cut 8"x8"x¼" angles where 6"x6"x$^3_4$" used to be thought large. This development is due to the increased size of structures and the demand for larger structural steel shapes.

Bending rolls have been improved and with modern rolls as shown in Fig. 10. With these 1½" plate can be rolled where five years ago rolls would bend up to ⅝ inch only.

Hydraulic Press.

With the development in Canadian railroads there has also been a development in the hydraulic press. The machine five years ago had a single plunger pump with cast iron cylinders for wheel work. Now steel resistance, copper lined cylinders and triple plunger pumps are parts of the improved hydraulic press.

Three sizes of plungers are attached, one or all may be used, sizes ¾ inch, 1¼ inch or 1¾ inch being available.

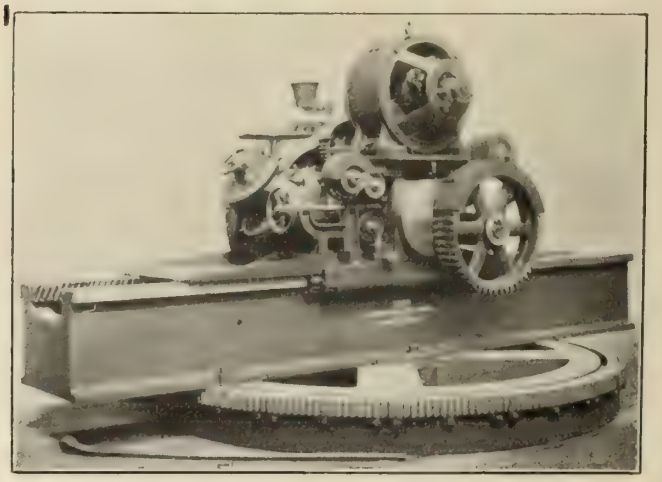

Fig. 11.—20th Century Rotary Planer.

From 150 and 200 tons was formerly considered a big machine; now 300 tons for carwheels and 600 tons for locomotive tires is used.

Rotary Planer.

The rotary planer is a development caused by the recent advances in structural steel work. The motor is mounted on the turntable as shown in Fig. 11. The first Canadian machine had a capacity of 24 inches. The company who installed the 24-inch machine is now installing a rotary planer of the same make, 67 inches in diameter. Planers are made up to 10 ft. diameter cutting head capacity.

Universal Radial Drill.

Fig. 12 shows a Bertram Universal Radial Drill, the latest product of the Bertram works, and is a new design. This machine is driven by means of a single pulley through speed box, and back gears. There are 16 changes of spindle speeds. The spindles are counterbalanced and provided with quick return. There are three changes of positive feed controlled by a pull pin conveniently located on the head.

The drill head is of the full-swing type, being mounted on a swiveling base and can be readily turned from a vertical to a horizontal position. It has lateral adjust-

ment along the arm by means of rack and pinion through a band wheel convenient to the operator.

The arm is of particularly rigid construction with vertical adjustment by power and is arranged to swivel. The inner column is rigidly bolted to the base plate and supports the outer column which rests on roller bearings, permitting easy swinging of the drill arm.

A conveniently arranged reverse lever in front of the drill head is used for tapping. The position of this lever

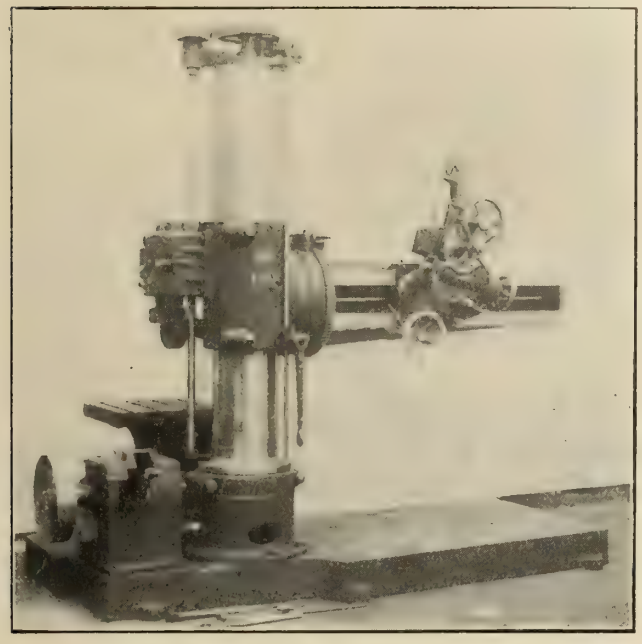

Fig. 12.—New Bertram Universal Radial Drill.

up or down indicates the direction of the spindle traverse while the drill spindle may be instantly stopped by lifting lever to central position. These machines may be readily changed from belt to motor drive at any time.

Bertram Boring Mills and Slotters.

Boring mills have been redesigned and increased from 42 to 100 inches. The Niles boring mill is built up to 20 ft.

Slotters are now made with motor drive and are convertible. Fig. 13 shows a 12-inch slotter with link slotting attachment. The worm of circular motion is disconnected and the bar is set to the circle required.

Steam hammers have also been redesigned to keep up with the demand made by the railroads for heavier locomotives and therefore heavier locomotive frames.

New Machines of Stevens Co., Galt.

About three years ago the Stevens Co. started to manufacture in Canada the Jones & Lamson or Hartness typ of flat turret lathe. Although this lathe was previously manufactured in United States it is the first of its class to be manufactured in Canada.

A new manufacturing lathe of simple design was recently placed on the market. It has powerful drive, being made for use with high speed steel.

Bawden 20-inch Drill.

The Bawden Machine & Tool Co., 22 Orillia Street, Toronto, manufacture a 20 in. drill which was placed on the market about two years ago. It is a pewerful drill, furnished with back gear, power feed, automatic stop and quick return.

London Machine Tool Co., Hamilton.

Another company which has made great strides in the redesign of machine tools is the London Machine Tool Co. Practically their whole line of slotters, drills, shapers, boring mills, planers, lathes and railroad machinery has been redesigned to keep pace with the demand for heavier machine tools for use in railroad shops.

Fig. 14 shows a large slotter built in 1909 by the London Machine Tool Co. In designing this slotter advantage has been taken of the largest users of slotters. The essential features in the design are the movable head and the quick power adjustments to head and to all motions of the table. Coupled with these are other improvements of extra quick return of ram, stroke indicator, automatic throw-out to feed, etc.

This slotter allows work being done requiring great reach. The quick power feature, on certain work, means an increase of 200 per cent. in output. Generally it does 50 per cent. more than the original designed machine. The machine illustrated will cut to the centre of a circle 7 ft. 6 ins. in diameter, and will cut to the outside of circle 9 ft. 2 ins. in diameter.

Heavy Wheel Lathe.

Fig. 15 illustrates a massive wheel lathe built by the London Machine Tool Co., Hamilton. All parts are designed

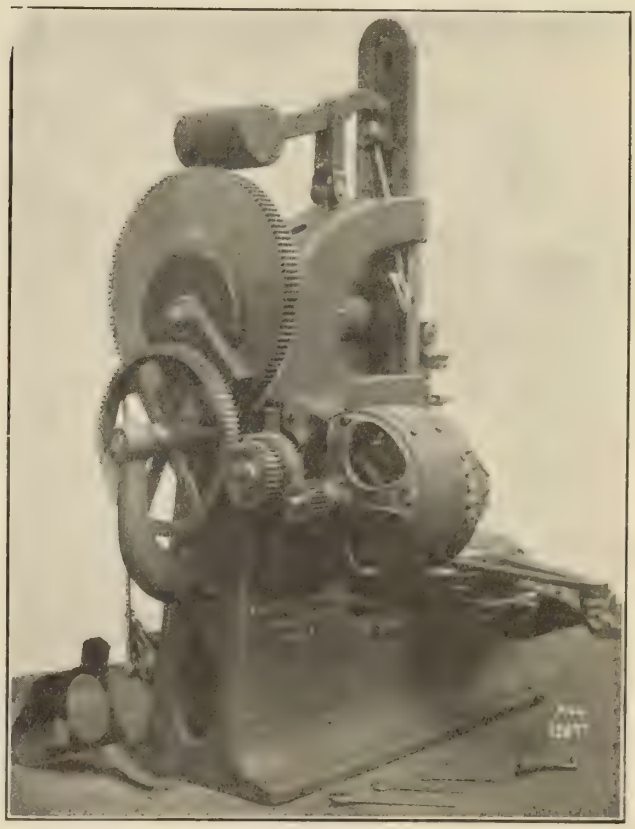

Fig. 13.—12" Slotter With Link Slotting Attachment.

for exceptionally heavy strains. It has been estimated that the cutting pressure on the two tools reaches as high as 300,000 lbs. It can therefore be imagined that the design of present day railroad shop machine tools must be in excess of everything heretofore produced to take care of wheels used in present day practice, and to stand such enormous pressures.

The face plates are 91 inches diameter, allowing wheels to be turned 86 inches diameter on the tread. The bearings are 16 ins. by 22 ins. long. The feeds vary from 16-100 of an inch per rev., to 48-100 of an inch per rev., having eight impulses per revolution. By means of clutches and change gears, working speeds are provided for all wheels from 56 ins. to 34 ins. in diameter, so that coach wheels may be turned in the same machine. The weight of the machine complete is about 102,000 lbs.

Motor-Driven Boring Mill.

The motor driven boring mill shown in Fig. 16 is a 104 in. manufactured by the London Machine Tool Co.,

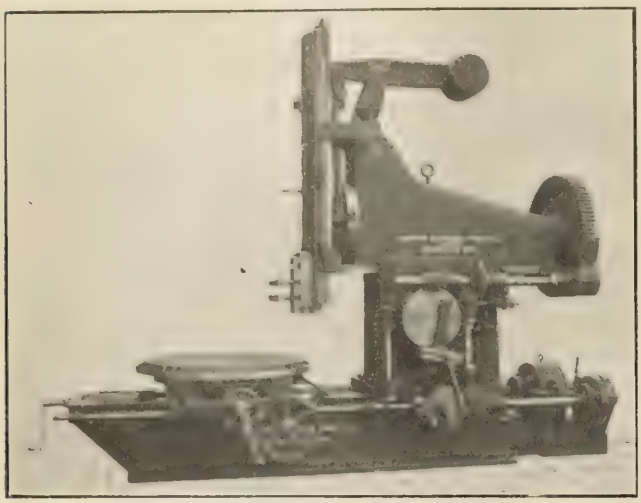

Fig. 14.—Improved Slotter Made by London Machine Tool Co., Hamilton.

Hamilton. This is operated by two D.C. motors. One is connected by gearing to the driving mechanism, and the one for raising the crossrail is located on the top of the frame.

Besides those illustrated the London Machine Tool Co., Hamilton, have redesigned their lathes, making several improvements in the attachments as well. A new radial drill, designed for using high speed steel and for heavy work has also been added to their line.

Their heavy double axle lathe is worthy of mention. It is designed to turning car, coach and locomotive axles,

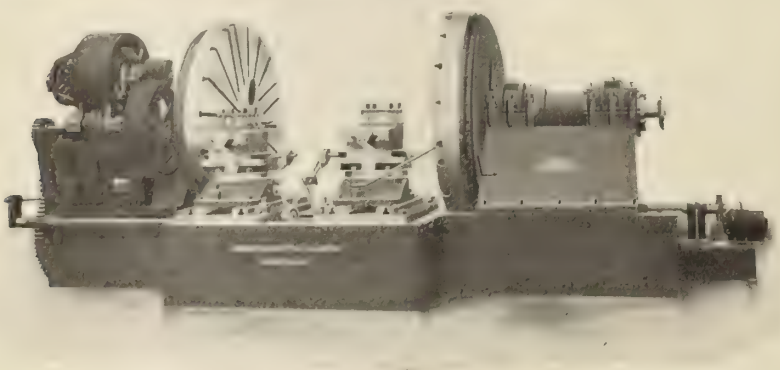

Fig. 15.—Heavy Wheel Lathe.

using high speed steels. A few of the prominent features of the machine are large bearing surfaces, powerful feed through splined rod, positive locking tool post, automatic steps to carriage feed, etc.

A Review of Improvements.

During the past few years many improvements have been made in all lines of machine tools. Fashions seem to have entered the machine tool trade and convertible machines is one result. Immediately after the introduction of high speed steel, there was an introduction of geared feeds. It will be seen by a perusal of this article, however, that Canadian builders of machine tools as well as other companies have returned to belt drive, though the convertible machine permits the attaching of heads for either belt, motor or gear drive as desired. The latest machines as described, have belt-driven feeds.

Some of the best results removing metal have been obtained from belt driven machines so that this is not merely a whim of the manufacturers in adopting belt-driven feeds, of good width and with wide pulleys. Old patterns have been laid aside and all the machine tools have been built on new plans. A machine of five years ago is entirely out-of-date. Improvements have followed each other, new features being rapidly added. What will be developed in the next five years is hard to prophesy. The demand for machine tools is increasing and when the transcontinental railroads start equipping shops which will inevitably follow, still greater improvements must be made and new lines added to keep up with the demands for tools for railroad work.

STANDARDIZATION OF CATALOGUES.

An Engineers' Standardized Publications Association was recently formed in England, having its headquarters at Craven House, Kingsway, London, W.C. Its object is to persuade manufacturers to conform to mutually agreed standards in the size and arrangement of price lists and catalogues, and facilitate reference to these publications by scientific classification of their contents.

While the shape and size of catalogues may seem a small matter, yet anyone who has attempted the classification and arrangement of the catalogues issued by Canadian and United States, British and other manufacturers, will appreciate the great difficulty of making an orderly collection of them. The result frequently is that the catalogues are not carefully preserved as they should be, and therefore fail to carry out the full purpose of their mission. When one considers the outlay on these publications, which are often handsomely and expensively gotten

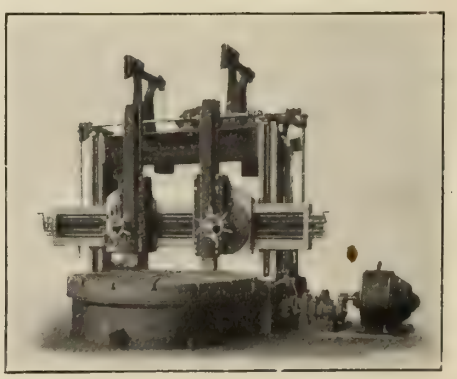

Fig. 16.—104" Boring Mill.

up, and the heavy expense of postage, the advisability of taking all possible steps to insure not merely a monetary welcome and appreciation, but a permanent place in a reference collection is self-evident. This is the age of filing cabinets, which are more or less of uniform size and all manufacturers might with profit consider the matter of standardizing their price lists and catalogues.

The Work of Overhauling Electric Railway Rolling Stock

Paper Read before the Canadian Street Railway Association, Dealing with the Various Operations in the Shops, to Keep Cars in Commission

By W. R. McCREA *

In presenting these remarks concerning the periodical overhauling of rolling stock, it is my intention to endeavor to convince those interested in the maintenance of electric railway rolling stock that periodical overhauling is absolutely necessary to obtain the maximum of efficiency and also that when this work is completed, the term, general overhaul will be amply justified.

Prior to three years ago very few of the cars on the Toronto system were overhauled with any degree of regularity. This neglect was responsible for some of the following results : Average daily cripple cars amounted to about 17 p.c. of all motor-operated rolling stock, failures in service were very common, line blockades interrupted schedules, cars out of service when required to fill schedules, inconvenience to passengers, lost mileage and revenue. This condition of affairs necessitated the introduction of a method of repairs whereby the average daily number of cripples would be reduced to a minimum. Instructions were issued by the management that all cars were to be put in first-class condition at once. This was done, but not without a very large expenditure of money ; the results obtained, however, were such as to prove without the shadow of a doubt the wisdom of permitting the above-mentioned expenditure. To-day in Toronto there are comparatively speaking no motor breakdowns in service, and as a comparison I may say, that instead of 17 p.c. of the cars being crippled as before stated every 24 hours, the daily average is now 3.7 p.c.; and it must be borne in mind that every car that is repaired, whether large or small repairs, is classed in the totals from which this percentage is struck. Those not included are those cars repaired by the night and day inspectors and repair men, after the cars are housed and have completed their day's run ; or, in other words, cars which have not caused any interruption to service or schedules. This is a considerable reduction you will admit, but we are endeavoring to lower this record, and those in charge of the rolling stock are of opinion that this can be done. The vastly superior service which we are now enabled to give has secured to the company a very valuable asset in the citizens' good-will.

* Master Mechanic of Toronto Railway Co.

Encourage New Ideas Among Workmen.

It is very necessary that the good work of overhauling rolling stock should be done in a most thorough and systematic way. The work should be laid out so that there will be no confusion of material, men or ideas. All the work should be done in a pre-determined manner. Gauges, measurements and tools should be supplied for the proper carrying out of the same. When a system of overhaul is finally decided upon as being the best suited to local conditions, it should become a law in the shop, and any employe departing from the standard of practice should be dealt with accordingly. The introduction of new methods or stunts or experiments should not be permitted until they are carefully considered by the proper officials. I strongly recommend that employes be encouraged to promote new ideas, and if on the presentation of them to the proper officials, they are found to possess even some small merit, every encouragement should be given the originator to perfect the same, and on the adoption of his proposal in practice he should, so far as the shop is concerned, receive all the credit due him.

Use Jigs, Patterns, etc.

In preparing the repair material in the Toronto Ry. shops, carefully kept jigs, patterns and gauges are always used in production. By this means absolute accuracy is assured, and the parts are interchangeable. The fact that the pit men or fitters have no work other than to bolt together and put to place, is a strong argument in favor of the repair material being properly produced in the company's shops or by outside manufacturers.

Toronto Railway Co.'s Methods.

I will endeavor to explain some of the methods in use in the Toronto Ry. Co.'s central shops. This system no doubt would be more readily understood by a visit to our works, which we will at all times welcome. The cars are overhauled on a mileage basis ; 50,000 to 55,000 miles being the limit of distance a car travels before being brought to the shops and thoroughly overhauled. Owing to the fact that our roadbed is now in a very much better condition than it formerly was, and the cars standing up so much better, the matter of permitting cars to run 70,000 to 75,000 miles before overhauling is now under serious consideration.

Overhauling a Car.

I will now trace the course of overhauling a car. Owing to the fact that overhauling was first started by rotation of car numbers, it is quite easy for us in the shops to know just about the car or cars due to come in, and as accurate mileage is kept on all cars, a glance at the mileage statements is sufficient to procure the proper car for overhauling. This done, the central car dispatcher is instructed to have that car delivered to the shops ready for the following morning. The car is then placed in a section set aside for the purpose, brake and cable connections unfastened, car body raised and placed on trestles, trucks are then pulled out from under the body and shunted to truck overhaul section ; here the motors are removed and sent to motor overhauling section.

The truck is completely stripped down, except side and end frame, wheel centres marked, and trammil points used to test for truck frame being true. Journal boxes are stripped of brassed wedges and waste, and thoroughly cleansed. Wheels and journals are now replaced if necessary. The stripped material has been placed on one side of the truck, the floor on the other side is swept clean. the truck inspector inspects the old material and o.k's. that which is to be used again. This o.k. material is now moved to the clean space on the other side of the truck, the balance is taken to the shop storekeeper, who gives in return a new or repair part for every one sent in ; this is then delivered to the truck fitters, and is placed with the balance of the o.k. material. The trucks are now built up, the journals being packed with clean, oil-soaked waste ; the trucks having been thoroughly scraped and blown off with compressed air, are now given a coat of mineral quick drying black paint, and ready for the motors.

Repairing Motors.

The motors are first stripped of armatures and field coils ; these with the brushholders are sent to the armature and machine departments respectively. The motor frame is next scraped inside and out, grease boxes cleaned out, bottom oiled, wells cleaned and washed with kerosene. The inside of motor frames are next painted with black in-

sulating compound, oiled canvass liners are placed around permanent pole pieces, frames are now ready for assembling. Field coils are next put to place and magnet plates bolted home, finished steel bolts and hexagon nuts with spring lockwashers being used exclusively for motor and truck work. The motor frames are now bolted together and a gauge inserted between the pole pieces to prove proper distances. The proper distance between magnets having been secured, the armature is next put to place and armature boxes bolted on. Equal clearance between armatures and magnets is next secured by use of a special gauge.

New spring felt feeder wicks are placed in bottom oil pocket of both armature and motor axle bearings, and oil receptacles filled with clean oil. Next a piece of felt is inserted in the grease hole at bottom of grease box touching the shaft, a square oil-soaked pad, half-inch in thickness, is then neatly fitted to the bottom of the box, the balance of space is then filled with hand-picked pure wool waste, the waste having previously soaked in oil 24 hours and dripped for 12 hours. Brush-holder yokes, and brushholders completely assembled, are now bolted to place. These parts do not require any alteration for the reason that they have been built up in a special jig, their coreect position and alignment on the commutator being both electrically and mechanically coreect.

The overhauled motor is now subjected to a running test on the floor for three hours with 40 amperes of current for the purpose of proving the condition of the bearings. While the motor is under test it is painted with a quick drying mineral black paint. The gears, pinions and gear case having been thoroughly cleaned of grease, the motor is now swung to place on the trucks and gears and pinions given an application of special compound, the two or four motors all having come through at the same time the overhaul truck and motor equipment is now ready for service.

Just as soon as car body is placed on trestles, the controller, rheostats, trolley stand and brake cylinder are removed and sent to their respective repair departments; they are at once replaced with new or overhauled material. Cable ducts on car body are opened, cleaned and repainted, renewals being made where necessary. Car body, wood and iron work repaired and painted. Overhauled trucks and motors are now run under, and body put to place, brake and cable connections made, brakes adjusted and car given a severe tryout under service conditions before being passed as o.k. by the inspector.

Armatures are first inspected for bearings and renewals made where necessary, cast steel sleeves lined with babbit being used for bearings. Next, the entire armature is carefully cleaned, commutator turned and polished, string band carefully inspected or renewed, and sent to the testing department. Here the millovolt drop test from bar to bar is used and finally the armature is subjected to a six hundred volt ground test, armature body then shellaced and placed in the o.k. rack. Field coils are then placed in section of motor frame without magnet, and a millovolt reading taken, next a magnet attached to an air cylinder is lowered on field coil and another reading taken while the coil is under pressure. If the coil reads up to the standard and shows no variation under pressure the outside tape is repaired and the coil dipped in air drying compound.

A great reduction in motor lead trouble has been secured by boring the motor frames on the axle side and bringing the leads out as near the king bolt as possible; this, of course, refers to outside hung motors. This practically covers the entire performance of overhauling a car.

WELFARE OF EMPLOYES.

The following is the investment and maintenance in the works of Yale & Towne Mfg. Co., Stamford, Conn.:

Investment.

1	Heating and ventilating	$74,200
2	Sanitation, drainage and water supply	49,400
3	Lighting, electric and gas	18,000
4	General cleanliness	0
5	Drinking water, filtration, refrigeration and distribution	6,200
6	Lavatories (included in item 2)	0
7	Locker rooms and lockers	57,200
8	Emergency room and equipment	1,200
9	Apparatus for removal of dust and fumes	8,000
10	Safety appliances on machinery	4,000
11	Library, reading rooms, lecture rooms and bicycle sheds	7,000
	Total	$225,200

Annual Operating Expenses.

1	Heating and ventilating	$14,620
2	Sanitation, drainage and water supply	6,324
3	Lighting, electric and gas	3,129
4	General cleanliness	4,811
5	Drinking water	932
6	Lavatories (included in item 2)	0
7	Locker rooms and lockers	6,467
8	Emergency room	1,303
9	Apparatus for removal of dust and fumes	1,200
10	Safety appliances on machinery	445
11	Library, reading rooms, lecture rooms and bicycle sheds	6,206
	Total	$45,437

In round figures, says Henry R. Towne, the foregoing statements imply an investment for the above purposes of about $100 per employe and an annual expenditure of about $20 per employe. While admitting frankly that this expenditure, both fixed and current, is "good business," because tending to increase the efficiency of labor and the contentment of employes, it can with equal fairness be stated that, if limited strictly to business requirements, these outlays, both fixed and current, would largely be reduced, probably one-half, and that the excess over what is necessary represents, on the one hand, a volutary contribution by the employer to the welfare, comfort and health of the employe, and, on the other hand, a substitute or equivalent to the employe of a direct contribution to an insurance or pension fund, because serving indirectly a similar purpose by increasing the earning power, by prolonging the activity and thus by augmenting the potential savings of the employe.

MACHINE TOOL PRICES.

The following prices supplied to the U. S. Consul by Daimler, of Austrian Daimler Works, Wiener-Neustadt, Austria, are of interest. These tools are of good design and the shop is one of the best in Europe.

The prices paid by Daimler for various machine tools in use were as follows:

John L. Bogert, machine for turning down crank pins, No. 22 $2,060. Prentice Bros. Co., lathe, 255 by 1,600 by 3,050 mm., $860; vertical drills, w.p. 1d, $111. Hendey Machine Co., lathe, 250 by 760 by 1,830 mm., $688. Gisholt Machine Co., turret lathe, No. II. $2,647; vertical turret lathes, No. 0, $1,631. Landis Tool Co., grinders, No. 1½, $926. Worner & Swasey Co., hexagonal turret lathes, No. II, $1,760; hollow hexagon revolver lathe, $1,535. Potter & Johnston Machine Co., automatic turret lathes, No. II, $2,619. Cleveland Automatic Machine Co., 51 mm. automatics, 3-spindle, $1,208; No. 1¼ automatics, 5 spindle, $2,660. Gleason Works, gear planers, No. I, $2,033. Becker-Brainard Milling Machine Co., vertical milling machines, No. IV, C, $935. Cincinnati Milling Machine Co., universal milling machine, No. II, $805. Lucas Machine-Tool Co., press for 30 atms., $545. C. C. Bradley & Son, hammers, A No. IV., $1,133. Yahley, pneumatic hammer, II, 1h. IV, $1,789.

CHORD INFORMATION.

By H. J. McCaslin.

The accompanying table of chords and angles is used by an electrical concern for spacing rator spiders, etc. I find it very handy in my shop work, and it may be found useful by some readers of Canadian Machinery.

For tool work, chord=sine × D. Angle is half of angle subtended by side at centre.

BOOK REVIEWS.

METAL SPINNING—By Fred. D. Crawshaw, M. E., Assistant Dean, College of Engineering, University of Illinois, Popular Mechanics Co., Chicago, Ill. Cloth, 5x7 ins. ; 74 pages, illustrations. Price 25 cents.

This is the only book on the subject, Metal Spinning, a very old art handed down from generation to generation without the medium of the printed page. It is a working manual of explicit instructions which is concise, yet complete and adapted to the use of manual training and industrial schools, as well as those who desire to spin metal as an art recreation or to follow this work as a trade.

EFFICIENCY AS A BASIS FOR OPERATION AND WAGES—By Harrington Emerson. Published by the Eogineering Magazine, New York, 171 pages, cloth bound, 5 x 7½ ins. Price $2.

The book is a result of a series of articles by Mr. Emerson published in the Engineering Magazine. These are now issued in book form. In the early chapters he points out typical inefficiencies in production and discusses the strength and weakness of existing systems of organization. Five general chapters covering the above ground are followed by a chapter on "The Realization of Standards in Practice." Some details are given of the method employed in standardizing as to time and cost, the tasks in a shop employing 2,000 men, each doing an average of four different jobs each day, a diagram is made illustrating graphically the effect on costs and profits of an increased output due to staff stimulus and bonus to the line. In chapter VII on "The Modern Theory of Cost Accounting" the author differentiates cost accounting from the work of the efficiency engineer, which is to establish standards, ascertain current efficiency and provide remedies which will bring low efficiency up to 100 per cent. Emphasis is put on the co-operation of the comptroller and the efficiency engineer. In chapter VIII "The Location and Elimination of Wastes" are discussed, and some examples are given of wide variations in costs in different establishments engaged in the same line of work. An efficiency system in operation is described in chapter IX and then in order "Standard Times and Bonuses" and "What the Efficiency System May Accomplish."

A STUDY OF THE OPEN HEARTH—Published by the Harbison-Walker Refractories Company, Pittsburgh, Pa. 91 pages, 5 x 8 ins. Flexible leather binding. For sale by R. S. Davis & Co., Pittsburgh. Price $1.

This book is a result of a study of the open hearth steel furnaces for the use of the operating department and is unique as no author's name is given nor does the name of the company appear except on the cover. Neither are there any advertisements. The reason for the book appearing in its present form was because of the interest shown in the data gathered together by a number of open hearth superintendents. The book presents in a concise form the principles involved in the manufacture of open hearth steel, and it should be of interest to iron and steel men generally. Detailed descriptions of the construction and operation of these furnaces are given in simple language that can be readily understood by one familiar with no more than the most elementary principles of chemistry and metallurgy.

Practical instructions are given for building the hearths and bottoms, front and back walls, bulk heads, ports, regenerators, etc., while the various materials for the bottoms (acid, neutral and basic), are discussed at length. One chapter is devoted to fuels, including natural, artificial and producer gas and oil. Simple methods of estimating charges for both basic and acid open-hearth furnaces are given, and these should prove of the utmost value to both shop superintendents and melters. The elimination of impurities during and after melting is explained in detail, and also recarburization, melting, method of charging, removal of slag, etc. The special processes such as the Talbot, Monell, Bertrand-Thiel and the duplex are briefly described.

MECHANICAL WORLD POCKET BOOK—Published by Emmott & Co., 65 King St., Manchester, Eng. 390 pages, 4 x 6 ins., illustrated. Price 6d or 12 cents. Postpaid 16 cents.

In this, the twenty-third annual issue, numerous improvements have been effected and a considerable amount of new matter introduced. The section on Gas Engines has been thoroughly revised by W. A. Tookey, and the same author has supplied an entirely new section on Oil Engines, including notes on Crude Oil Engines. Some condensed notes on the Design of Centrifugal Pumps have been contributed by B. M. Woodhouse, and a new section on Ball Bearings has been included. Among other additions are the following :—Dimensions of Marine Boilers ; Tapers and Angles ; Change Wheels for Cutting Metric Pitches ; Hobs for Cutting Involute Gears ; Dimensions of Ring-oiled Bearings ; Notes on Double Helical Gears, Bevel, Spiral, and Worm Gears ; Emery Wheel Speeds ; etc. Various other tables and data have been introduced and the work revised generally. The publishers are to be commended upon their continued enterprise.

BRITISH TRADE IN CANADA—By Herbert J. Rodger, published by "Canada," Newspaper Co., 34 Norfolk St., Strand, London, Eng. 72 pages, 4½ x 6 ins., illustrated. Price, one shilling.

The book is a result of a business trip through Canada in 1908, by Mr. Rodger and is a reprint of thirteen articles contributed to Canada. His report covers every line of British goods and manufactures for which there is a market in Canada. Among the subjects treated are Aluminium Goods, Machinery, Electrical Goods, Metals and Manufactures of Metals, Metals in Raw State, Bolts and Nuts, Packing, etc. The subjects include also railway and shipping facilities, catalogues, cost of traveling, advertising, etc. The work should be of great practical value to the British manufacturer looking to the Canadian market to extend the sale of his output.

Some Pertinent Paragraphs Selected From Our Exchanges

Many Useful Ideas Given in a Paragraph—Abstracts of Important Subjects Being Treated in the Technical Publications.

System in the Twentieth Century.

The old way for a workman to get the big traveling crane, by going out in the runway, waving his arms like a windmill and yelling until he was hoarse at the sleepy crane operator two or three hundred feet away, has all been done away with, and now the workman presses one of the buttons set at convenient distances along the shop runway, a red light is flashed in plain view of the crane man and, unless already employed, he at once runs his crane to where it is needed. Then, too, there is a messenger system in use that obviates the necessity of a machinist leaving his work to get a new jig or tool, as he has only to press a button close to his machine and an annunciator near the tool room indicates to a waiting messenger boy where he is wanted, as all machines are numbered; he then goes at once and finds out what is wanted, gets it for the man and returns to his place ready for another call.—Machinery.

Making a Skilled Mechanic.

The best way to obtain skilled labor is to make it.

This is the conclusion that the C.P.R. has reached after trying various methods and watching how the corporations get their supply. It has furthermore determined that the making of it shall be thorough.

It is said that although some railways and industrial firms which have entered upon elaborate schemes for the training of apprentices, the educational schemes, with one or two exceptions, lack continuity. They leave off where they practically should commence, and the apprentice or employe is turned out after a partial training and left to his own resources.

The question of the "Making of a Skilled Mechanic" is discussed in an article in Canadian Machinery, by Mr. F. C. D. Wilkes, B.Sc., who takes as his object lesson the scheme of the C. P. R. for obtaining skilled labor.—Montreal Herald.

The Boss's Shadow.

A business demands the entire time and attention of the proprietor or manager. A word, a friendly nod goes a long way. An old mechanic once said, "The boss's shadow is worth $5 every time it falls across the job.—Men's Wear.

Tool Rooms and the Care of Tools.

The fact has grown upon us that those shops where a thorough card system is in vogue in regard to tools and their uses seem to get the work done with less friction and less loss of time than is the case in those shops where no card system exists. The card system that we refer to implies a systematic method of numbering the pieces of work that may pass through the hands of the workmen. The number of operations in their order, the number of tools required and their specific markings, are set down, to which in a general way the average time taken in the operations may be added. The mere matter of storing the tools must necessarily remain an open question which will readily be solved by the intelligent foreman and superintendent to suit the requirements of the situation—Railway and Locomotive Engineering.

To Furnish Apprentices.

"Canadian Machinery" devotes two pages to Hamilton Technical School with one page of illustrations. It regards the school as likely to furnish apprentices for many of Hamilton's great manufacturing industries. — Hamilton Times.

The Designer and Shop Costs.

Inefficiency in the operation of machines, while not always readily discernible, can be detected by experimenting with different methods, without adding much to the cost of production, even temporarily. Losses arising from badly arranged buildings and machines can be detected by close observation of daily operations, and the cost of providing better facilities, as well as the saving to be expected by their use, can be ascertained within narrow limits.—Southern Machinery.

Get Next and Keep Near Your Employes.

Are you an employer of men? Get near them—keep next. No man who cannot get next and then keep next can control men successfully to the end of eternal welfare and the permanent success of an industry.

"I keep my employes in their place during the work day. After hours they are my friends," said a wise old fellow who always had an open mind for a new or better idea. It keeps up a mutual interest that makes for harmony and the absence of friction. We may be wrong, but it is our idea that the absence of friction is a big factor in a profitable business.

Get next and don't lose your grip.—American Shoemaking.

Watch the Iron Prices.

The foundryman who has an absolute control over his mixtures, following up each detail and studying the market carefully, is able to work in a considerable tonnage of off grades of iron, including malleable, Bessemer and various other grades which at times can be picked up at a special price. As the price of foundry iron has a tendency to increase, the tonnage of this class of iron utilized by foundrymen generally increases. This in turn serves to prevent the price of foundry iron from soaring unduly high.—Castings.

The Devil of Debt.

The devil of debt seems to be on the heels of almost everybody. The clerk, he's in debt. The bookkeeper's in debt. Ditto the typewriter. Same with the porter and drayman. As to the superintendent, he can't remember when he wasn't. The office boy would be in debt if anybody would trust him. And all of them complaining and acknowledging the miserableness of their condition.

Debt is a mortgage on your salary.

Debt is a monument to a young man's weakness, a grown man's folly and an old man's failure in the university of life.

Debt is discounting to-morrow's liberty for to-day's good time.

Debt is a quitclaim to your wife's confidence, your children's ambitions and your own self respect.

Debt is a guaranteed insurance policy against happiness.

"Then what are we going to do?" say a chorus of young fellows and business men and aspiring women and laborers and clerks and managers and street car conductors and hundreds more.

Do without!

It will take some backbone. It will take some genuine courage.

But you'll be able to hold your head up—and that's more than you can do now, and you know it. You won't have palpitation of the heart when the postman blows his whistle, and you won't tremble every time the boss asks you to come into the front office. Neither will you be ashamed to have your stenographer open your mail.

Because you'll be working to-day for to-morrow's satisfaction, and not to make good on account of yesterday's extravagance.—Pittsburg Press.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

MILLING ON A PLANER.

By K. Campbell.

Mr. Stevens of the Stevens Co., Galt, Ont., has in use in the machine department a milling machine which he constructed under his supervision. Since then several have been made for other companies, the original one being shown in the illustrations herewith.

Fig. 1 shows the machine at work and Fig. 2 shows the driving mechanism. A piece of work is on the planer, and in the illustrations the miller is shown at work, a large casting being on the planer. The belt shown in Fig. 2 connects with an overhead, and power is taken to the miller by the belt shown in Fig. 1. The machine is fastened to the planer head and is under full control of the planer operator. It has been found that with the miller, work can be accomplished in a short time that formerly took hours to do.

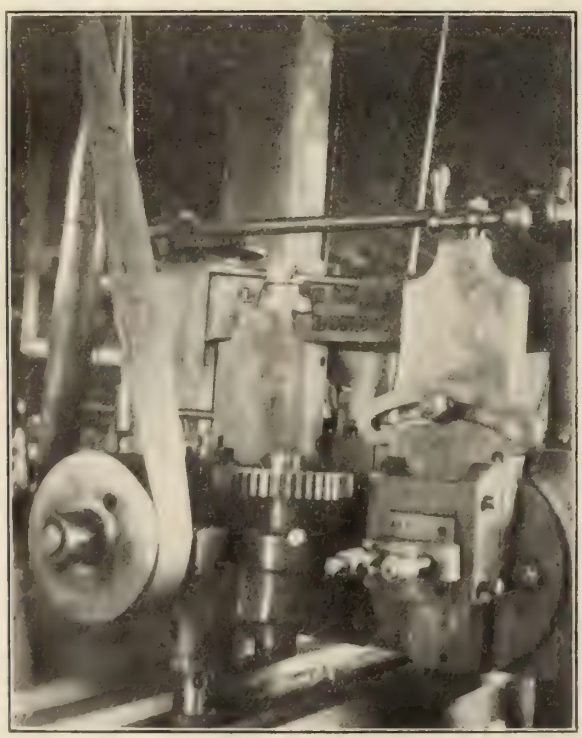

Fig. 1 Milling Machine Milling on a Planer.

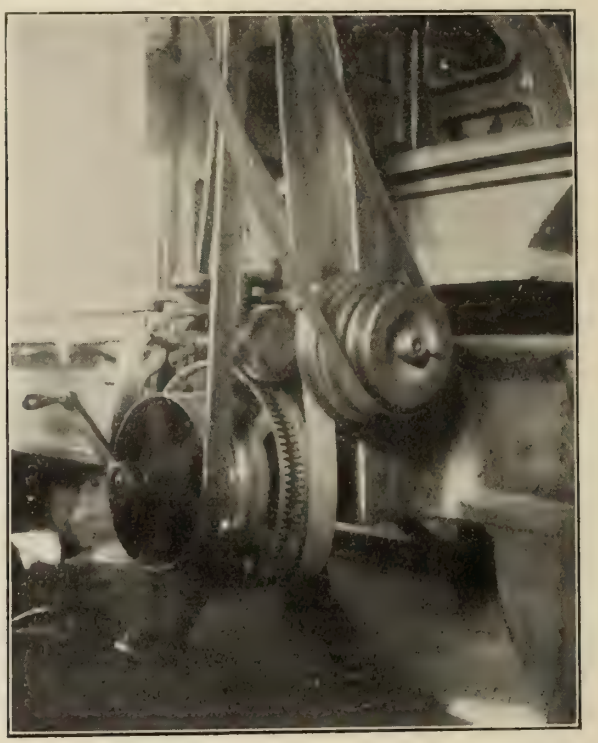

Fig. 2.—Driving Mechanism of Milling Machine and Planer.

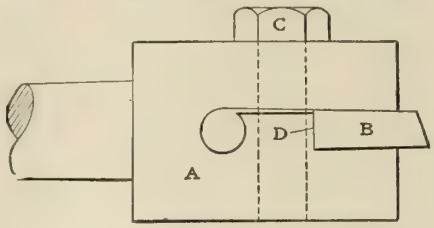
AN END MILL.

By K. Campbell.

The accompanying cut is an end mill used in the works of Smart-Turner Co., Hamilton, manufacturers of pumps, cranes, etc., and designed by the superintendent of the machine department. The holder A is made of machinery steel with the end slotted



An End Mill.

for the cutter B, which is clamped with an ordinary $\frac{5}{8}$-inch cap screw C. The cutters are made from high speed steel blades of cutting-off tools, the top or widest part D being used as the back when in the holder. These are used on steel and brass with a cutting face up to $2\frac{1}{2}$ inches.

JIG TO HOLD MITRE GEARS.

Under this heading it was stated that F. A. Rodgers devised the device shown on page 43 of the December issue of Canadian Machinery by means of which he turned out "25 in nine minutes." This should have read "25 in nine hours," which meant a great saving over the old method.

By M. E. D.

By K. Campbell.

A simple arrangement for holding drills has resulted in a saving in drill accounts in the shops of the Stevens Co., Galt. An iron plate about 1-inch thick is used, it being drilled to hold various size drills. Formerly long drills used to be taken and used for all work but with the arrangement illustrated a workman finds it just as handy to take short drills and use them for work where short ones can be used.

The drill plate contains two holes for each of the larger size drills and four holes for the smaller sizes. The holes are drilled the exact size of the drill and when the machine hand is finished

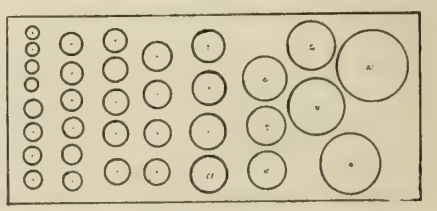


Plate for Drills—Plate May be Drilled to Suit Drills Used.

with a drill he returns it to the plate. The plate is handily situated on a small stand beside the drill.

AUTOMATIC RELIEVING FRICTION CLUTCH.

By C. J. Fensom.*

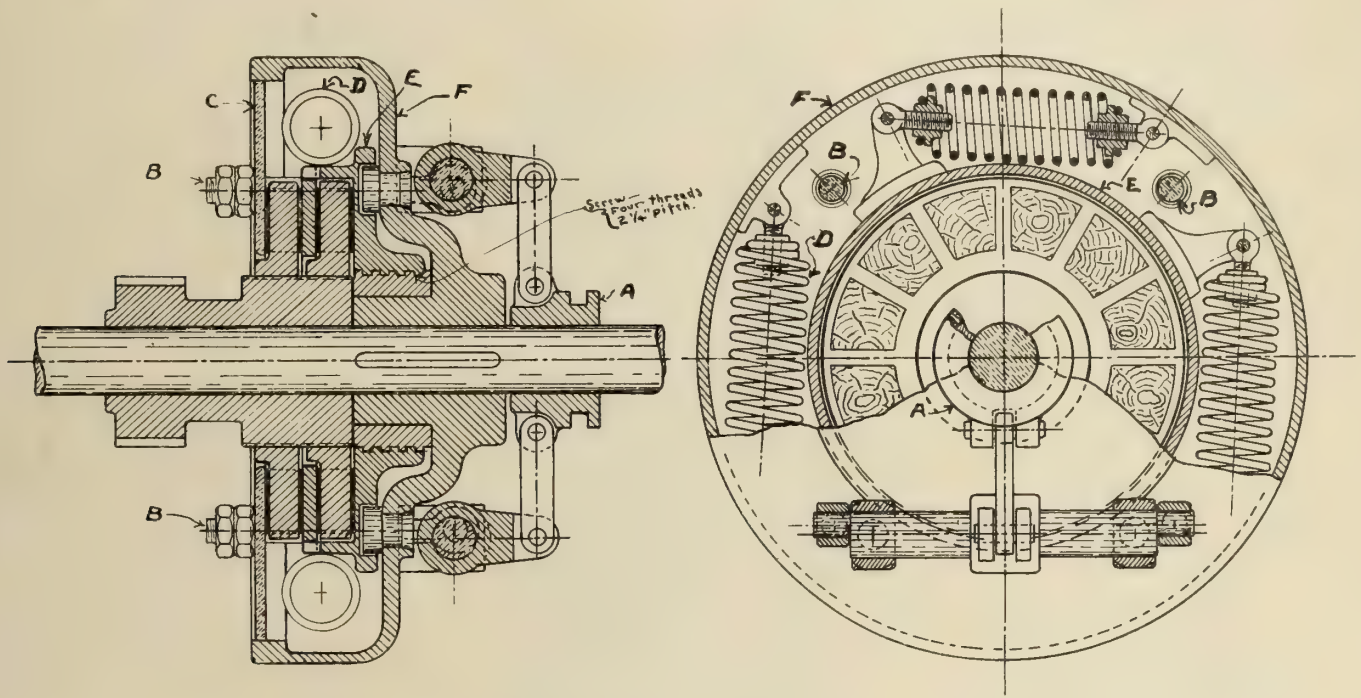
The friction clutch shown in the illustration was designed to drive a piece of heavy, slow running machinery which was liable to become "jammed" at any moment. The arrangement of the machine would not permit of the use of a belt ; and it was feared that the ordinary form of clutch, if made powerful enough to drive when the friction surfaces were smooth and oily and when the adjustment was slack, would be of little use as a relieving coupling at times when the adjustment was slack and the surfaces rough through disuse.

The design of the clutch shown is such that it can only transmit power up to a definite pre-arranged maximum torque, regardless of the condition of the friction surfaces. This means that the driving motor, or the machinery driven, cannot be subjected to an undue strain when the machinery is started against a heavy inertia load, or should a "jam" occur.

The clutch is operated by hand in the ordinary way. A motion of the sleeve "A" causes the four compressing bolts "B" to act on the end friction disc "C," thus relieving or pressing together the four pairs of friction surfaces.

The principle of the special regulating feature of the clutch is as follows : When the clutch is in action the torque is transmitted through the medium of the heavy driving springs "D," which are set to yield at a certain definite pull. Should the torque transmitted tend to exceed the capacity of the springs, the springs will yield, thus allowing the end friction plate "E" to turn slightly in relation to the driving casing "F." This motion allows the end friction plate (B) to screw back until the pressure between the friction surfaces of clutch is reduced to such an amount as to just allow a driving force to be exerted corresponding to the strength of the driving springs.

This clutch can be made "reversible." It could be used, without hand operating mechanism, as a relieving coupling in cases where the ordinary form of clutch would become in-operative through periods of disuse and consequent "freezing together" of friction surfaces.



Automatic Relieving Friction Clutch.

PAINT FOR METAL SURFACES.

By O. C. Harn.

Regarding preservative coatings for iron and steel, we find it necessary to point out that a paint which may be a good paint for the under coats may prove to be an undesirable paint for the outer or finishing coats, and vice versa. We will call the paint which is to go next to the metal the "protective paint," and the paint which comes outside the "finishing paint." The finishing paint should be, in reality, a "protective paint" also, but, for clearness in discussion, it is necessary *we should make a distinction.

The protective paint should measure up to the following :

It should form a hard, adherent foundation for subsequent coats. There is nothing else which tends so much to the cracking, checking and alligatoring of paint as the application of relatively hard coats over relatively soft coats. This is an observation which should be kept in mind not only in the painting of metals, but in all painting. That the priming coat should have the power to adhere tenaciously to the surface is self-evident.

The pigment constituents of a protective paint should be inhibitive of corrosion. This means that it should tend to give passivity to the particles of the iron itself—should by its nature tend to prevent that activity of molecules which we have described as galvanic and which causes corrosion.

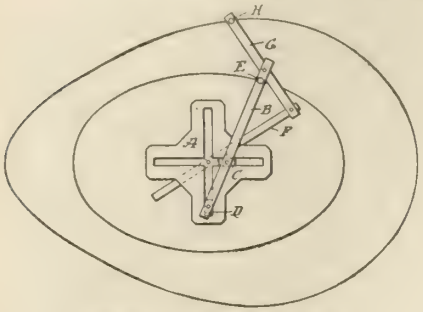
A protective paint should be a non-conductor of electricity. The corrosion of iron and steel being the result of a galvanic action, it is necessary not only to put on a paint which will be inhibitive—that is, keep out those influences which will set up the galvanic action in the iron itself—but it is supremely necessary also to bar the way to stray electric currents from the outside. In these days, when electrically charged wires run everywhere, under the streets, overhead and through all buildings, the leakage of electric currents is an every day problem. The real solution of the problem would seem to be to confine these electric currents where they belong instead of allowing them to run riot among neighboring property. Motives of economy itself will doubtless some day lead the owners of the runaway electricity to correct this evil themselves, but until that day arrives we must do our best to protect our property against currents which are running amuck.

* Consulting Engineer, Toronto.

DEVICE FOR DRAWING OVOIDS.

By J. O. Brouillet.

The instrument illustrated herewith can readily be made by any handy man, and will enable him to draw ellipses of various sizes and ovoïds as well. It consists of a sheet-metal piece A, in



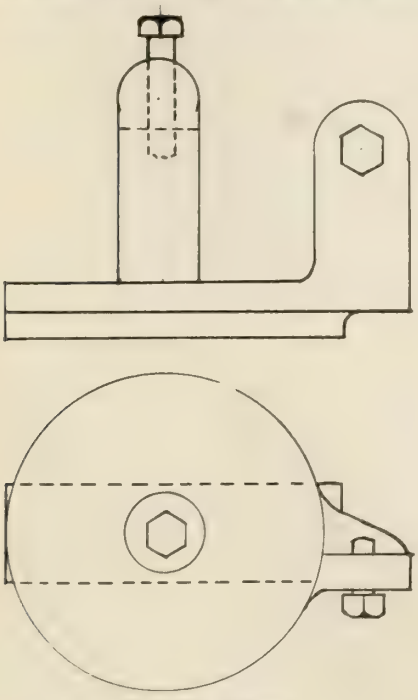
Device for Drawing Ovoids.

which two slots are cut crossing each other at right angles. A lever B is provided with two blocks C and D, adapted respectively to slide in the slots. A lever F, which is fulcrumed at the centre of the plate A, is connected by means of a lever G with the end of the lever B. A pencil may be fitted through a hole in the lever B, and as this is revolved around the plate A, it will trace an oval or elliptical line. At the same time a pencil in the lever G will trace an ovoid, as indicated in the drawing.—Scientific American.

TOOL POST PLATE.

By Robt. Buchanan.

The accompanying sketch shows a tool-post plate to be used when boring



Tool Post Plate

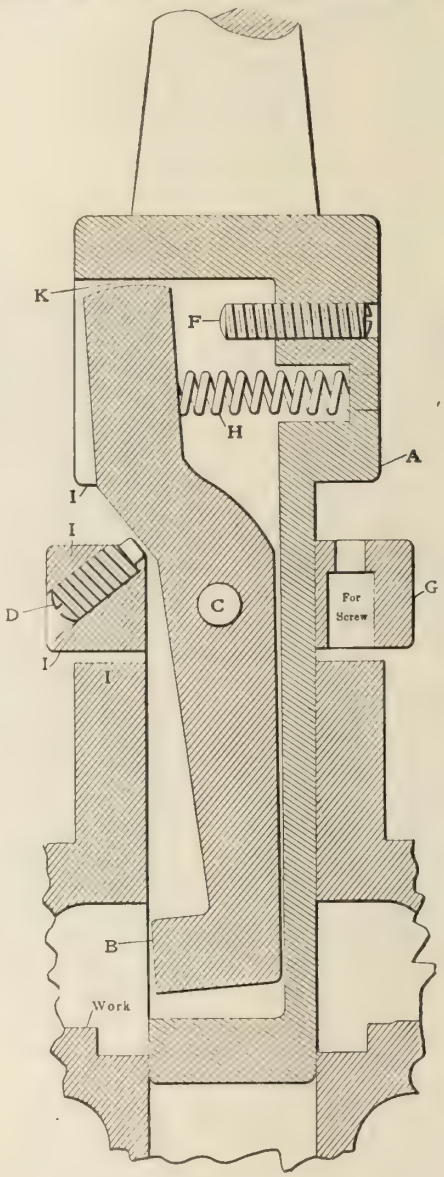
on the lathe to prevent the tool from swinging round. It may be made to use the wedge or will give better service if made flat and of the right height to carry tools or tool holder.

The cleats on the bottom are shapered to fit the rest, while the set screw on the lug at the back is adjusted to the tool after it is set.

AN ADJUSTABLE INSIDE FACING TOOL FOR THE DRILL PRESS

By Charles Eisler.

The cut shows in section a facing tool for inside work on the drill press. The operation on this work was always made in a lathe where it required a



An Inside Facing Tool.

skilled man. A man with very little skill can do the same job with greater output now.

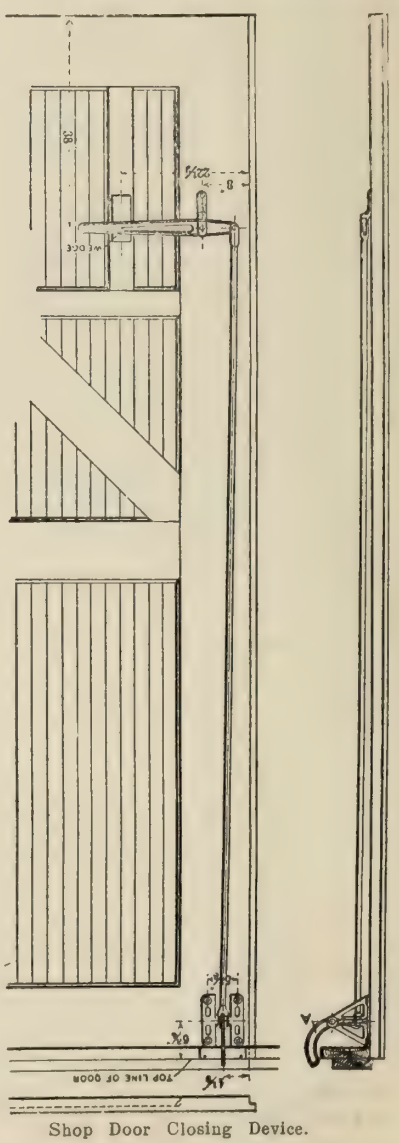
A is the body of the tool holder (a round piece of tool steel) in which a slot was made for the facing tool B. C is the pivot pin. D is an adjusting screw. After the tool B is ground it can be adjusted to the required size. F is also adjustable to prevent the tool going too deep. G is a sliding stop collar on A (screws not shown). H is the spring which holds the tool B within the holder body A and strips the collar G down, after the work is done. When the faces I I I I are together the work is done.

The tool B was also fitted to bear on K to prevent the quick wearing on the pin C. It will be noticed that the tool holder on the lower end is not cut through so as to make it more solid. The tool was used on brass, but there is no reason why it should not work on other materials.—American Machinist.

SHOP DOOR CLOSING DEVICE.

The heating of factories, machine-shops, roundhouses and other buildings having large doors is seriously retarded by the leakage of volumes of cold air in over the doors at the top. The ordinary large sliding or swinging door almost invariably bulges at the top, making a a crack of considerable width through which the cold air blows in greater or less volume according to the exposure and the velocity of the gale.

During the past few years the heating of large shops and roundhouses has



Shop Door Closing Device.

received a great deal of attention, and no modern structure is considered complete without adequate means of heating. The old idea that the men should keep warm by hustling has been generally discarded, and now every up-to-date factory manager realizes the importance of providing as nearly as possible a uniform, comfortable temperature in all workrooms. The cost of heating large buildings in northern latitudes is a heavy item, and practical means that will shut out the cold air where it should not enter, merit attention.

Realizing the serious loss that results from bulging doors in railway shops as well as in other works having large doors, through the lack of close fit at the top, J. C. Hassett, technical instructor of apprentices of the Erie Railroad, Meadville, Pa., has devised the shop-door closing device, illustrated herewith, in which the action of the device and the details of the component parts are shown.

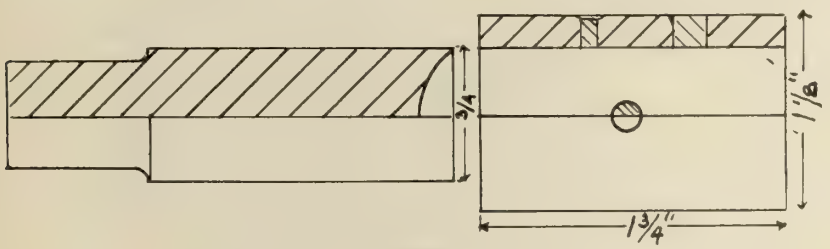
The arrangement provides means by which the door is clamped and forced solidly against the jamb at the top by means of the curved piece A, which is worked by a connection and lever conveniently located on the door. The connecting rod may be of any length required to suit the door height.—Machinery.

HANDY BENCH TOOL.

By F. B. Kennedy.

The accompanying sketch shows a very handy tool suited for all mechanics who find it necessary to snip small pieces of cottars, rivets, etc. It will cut with a clean fracture up to 5-16 or ⅜ inch soft steel or brass wire.

The plunger should be made a good fit for the barrel and cupped out as shown, but not too sharp an edge. The holes may be bored of course, to suit the convenience of the worker and good steel should be used for the whole tool.



Handy Bench Tool.

A CUTTING-OFF TOOL.

By A. Strong.

The accomnaying sketches illustrate a couple of tools we have found to be very handy. Perhaps they are not new, but I have not seen them before.

Figs. 1, 2 and 3 illustrate a cutting-off tool for rapidly cutting to the same length rods and pins. The tool A is reciprocated by the lever B working on the fulcrum C. D is a stop for the lever B in the back position. The stock is inserted through a loose bushing E, which may be changed for different sizes. The adjustable gauge F fixes the length. We used the tool in a small single gear hollow mandrel lathe, and the shank G was held in the toolpost provided for the hand rest. The wire was drawn forward each time against the stop F, after releasing the chuch. The chuck was then tightened and the parting off rapidly done by means of the tool and lever described.

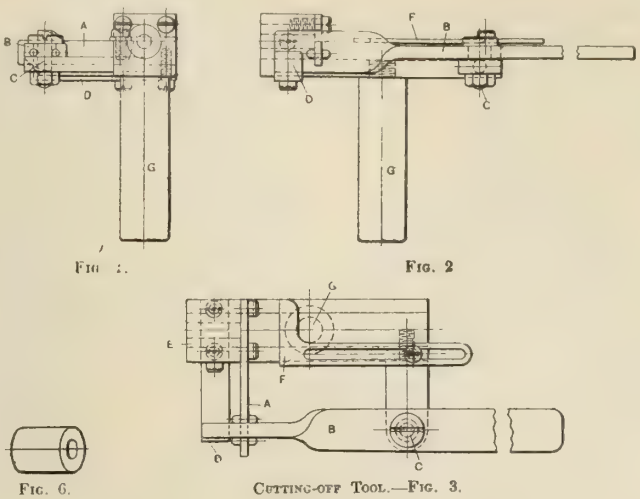


Fig. 1. Fig. 2

Cutting-off Tool.—Fig. 3.

Fig. 4.

Fig. 6.

Fig. 5.

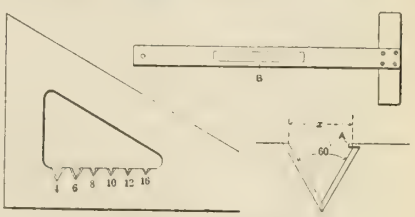
Fig. 4 shows a simple centreing tool used in conjunction with the above. It was made to drill exactly central, and all to the same depth, some thousands of small steel dies. The stock was held in the chuck of the lathe, and the tool was held by the shank S in a lathe carrier, and was brought up by means of the back centre. The aperture T, of course, exactly fitted the stock. After drilling they were parted off with the tool described above.

Figs. 5 and 6 show the articles we had to produce in some thousands, and in the rapid production of which these tools assisted not a little.—Mechanical World.

DRAWING OF V-THREADS.

By Joseph Weaner.

I found the drawing of V-threads to be very trying until I thought of the following scheme which makes this work much easier. The idea is as follows: File a number of 60-degree notches in the inner edge of the triangle, as shown in the illustration, for different thread pitches. Make the top width x equal to 1 divided by the number of threads per inch, and leave a small point A to stop the pencil. To use the triangle, place the pencil against the left side of the notch and run it down that side and up the other to the stop; then move the triangle to the right until the pencil is again against the left side. By repeating this operation as many times as is required, a uniform thread can be rapidly drawn. Another sugestion for draftsmen is to have a 12-inch scale fastened to the T-square as shown at B. This is also a time-saver, as the scale is in a position where it is always ready for use.—Machinery.



Drawing V Threads.

According to a writer in the Scientific American, a very handy tool can be made from an old pair of scissors or shears by cutting one blade with a set of saw teeth inclined toward the handle. These teeth hold the material fast, and prevent it slipping toward the point of the shears. Rubber sheeting, strips, and all kinds of soft packing can be easily cut with square or inclined ends.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

SHELDON'S IMPROVED REVERSIBLE EXHAUSTER.

Herewith are illustrated Sheldon's new reversible type medium blowers and exhausters. These fans are reversible and interchangeable and can be bolted to the floor, wall, post or ceiling. The bolt holes around the side openings are drilled to a template equal distances apart and are alike on both sides, therefore the arm and circular plate supporting the bearings can be removed and attached to the opposite side of the fan, the inlet side plate being interchangeable, thus reversing the hand of the fan.

The circular side plates referred to are larger in diameter than the fan wheel so that the wheel can be removed without taking the whole fan to pieces. The bearings on these fans are self-oiling and self-adjusting and are of the ring oiling type, capable of continued operation without undue attention.

Every wheel is carefully and accurately balanced before mounting and all fans are tested before leaving the works. The sizes of the wheels on these fans are practically the same as on our standard type medium exhausters and the fans are specially adapted for handling gritty dust, such as comes from emery wheels, tumbling barrels, rattlers, etc., which quickly cuts into and destroys sheet steel.

They are specially adapted for the removal of smoke from forge fires, steam from cooking vats or kettles in dye works, breweries, packing houses or other factories, blowing coal dust or powdered coal into rotary kilns or other furnaces, ventilating toilet rooms in public buildings, etc. They are practically noiseless, even at very high speeds.

Fig. 1.—Medium Exhauster (Reversible Type.)

Fig. 2.—Reversible Exhauster, Bolted to Wall or Post, Discharging Downward.

These exhausters are manufactured by Sheldons, Galt, Ont.

CINCINNATI 16-INCH LATHE.

The Cincinnati lathe is furnished with an all geared device having an unlimited range in addition to the quick change gear lathe for cutting screws shown in Fig. 1. Fig. 2 shows the spindle which, through the reverse tumbler, drives the stud gear shaft M. On this is bevel gear A that meshes with pinion B driving shaft R and worm C. These are supported by swinging bracket G pivoted about shaft M. To shaft S, in the gear box, is splined a triple-worm wheel D E F, that pass constantly through oil held in a resevoir. Any one of these wheels may be shifted into position under worm C by fork T, operated on outside of box. The rate of

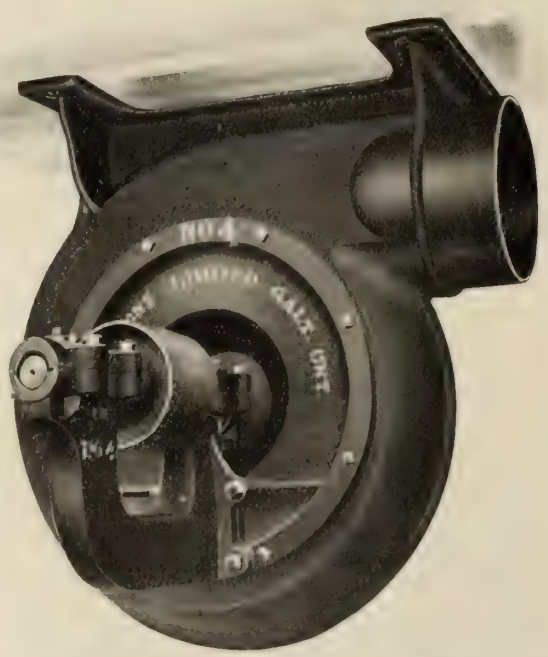


Fig. 3.—A Reversible Exhauster, Bolted to the Ceiling and Discharging Horizontally.

speed is changed at once by pulling out bolt P then raising arm G and shifting to the worm wheel giving the desired feed. When engaging sliding gear H I with either J or K, on feed rod, permits six changes instantly varying from 16 to 100 turns per inch, a range of feeds enough on any 16-inch lathe for general manufacturing, without requiring the use of the change gears also furnished.

Twenty-two additional changes ranging from 5 to 64 per inch may be obtained to suit special cases by sliding gear W on lead screw in mesh with gear J, on feed rod, which is driven direct from spindle. Lead screw is operated only when required for actual threading. Lock bolt U and arm G are so placed that the former prevents gear W being thrown into mesh with J until G is raised when it is impossible to engage worm wheels.

Both Figs. 1 and 3 are furnished with apron of box type construction, chasing dial, automatic stop, plain or compound rest, centre rest, follow rest, large and small face plates, necessary wrenches, self-oiling friction countershaft, etc., either five step or extra wide three step cone with double back gears, and the metric system if desired. Taper attachment may be added to equipment when wanted. Drawn-in attachment, oil pan, turret on carriage, can be furnished, and a lathe with six positive geared feeds by merely shifting a lever using the regular or any special change gears for screw cutting.

These lathes are manulactured by the Cincinnati Lathe & Tool Co., Cincinnati.

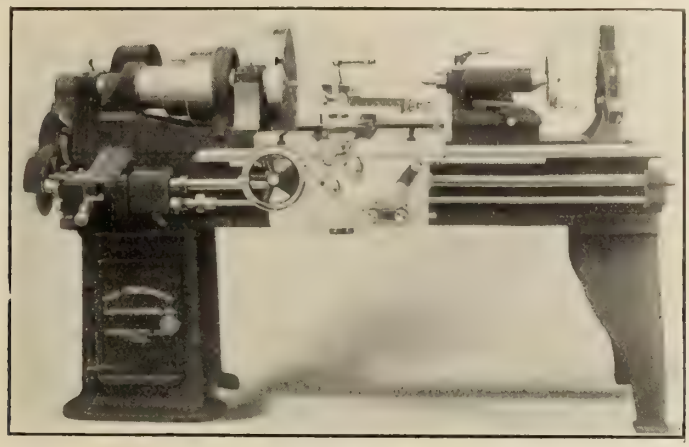

Fig. 1.—Cincinnati Lathe With Three-Step Cone.

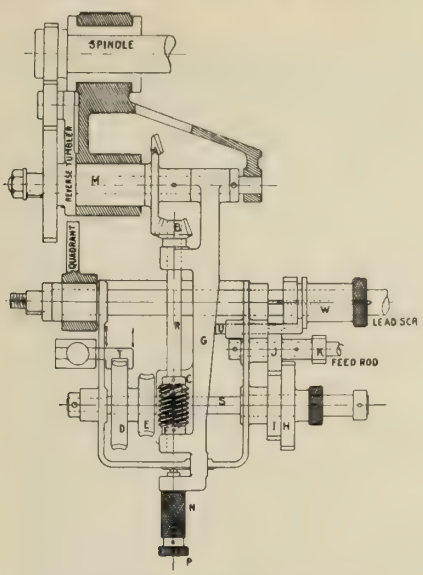

Fig. 2.—Diagram of Positive Feed.

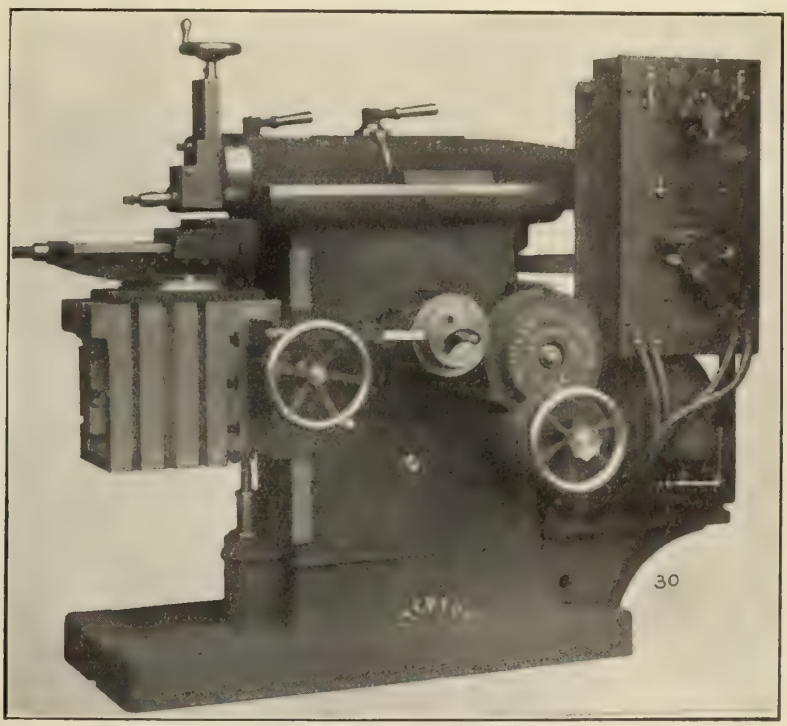

Improved 16" Steptoe Shaper.

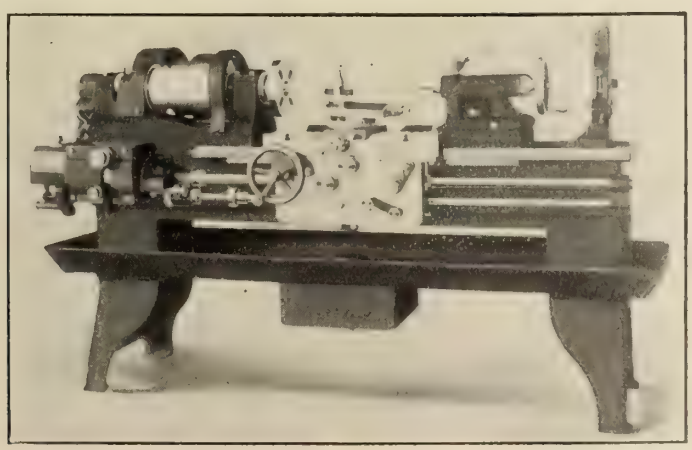

Fig. 3.—Cincinnati Lathe With Instantaneous Change Gear.

JOHN STEPTOE 16-INCH SHAPER.

The principal feature connected with the drive is in the fact that the motor stand is set on the base of the machine, thus avoiding any vibration when the motor is running, and at the same time it is as close to the column of the machine as it is possible to get it. It takes up no more room than is actually required for the return stroke of the ram. This was necessary on account of the

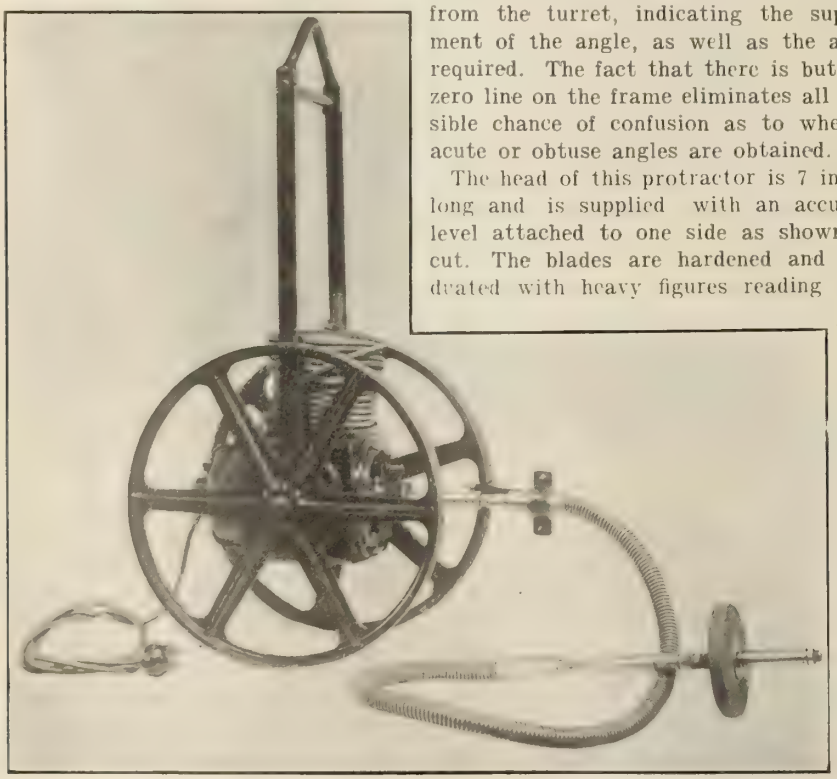
fact that the machine was built for the U. S. Battleship, "Deleware," and as the space was limited, it became necessary to take only as small a space as possible. The controller was placed on the top of the motor so that the operator would not be compelled to leave his position to change the speed of the machine. The motor was manufactured by the General Electric Co., and has a speed variation of 2 : 1.

The new feature on this machine is the self-adjusting feed rod. The table can be either raised or lowered by the operator, and the feed rod will adjust itself. The device is a very simple one, as it consists of a friction box through which passes the feed rod of flat cold rolled. The hooks on the end of the friction box will pull out the rod or shorten it as the table is raised or lowered by the operator. By means of this device, the breakages are prevented which are usually due to the table feeding to the end of the cross-rail, and the nut on the back of the apron striking the end of the cross-rail.

The shaper is manufactured by the John Steptoe Shaper Co., Cincinnati, Ohio.

PORTABLE DRILL REAMER, ETC.

The portable machine, illustrated herewith, is made with various attachments



Portable Drill, Reamer, Grinder, etc.

so that it can be used for numerous operations such as grinding, drilling, reaming or as a tube expander or cutter. It is made as a breast drill from ¼ inch down, or as a drill press up to 1¼ inch.

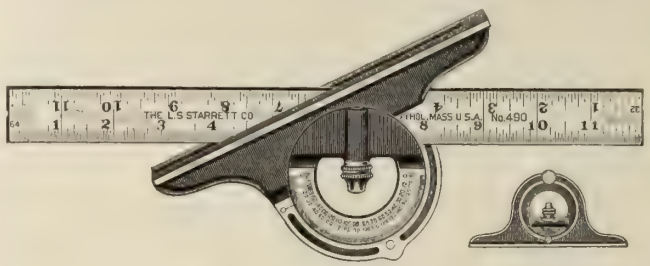
The illustration shows the machine arranged as a grinder. It is manufactured by the Lancashire Dynamo & Motor Co., 152-4 Bay St., Toronto.

NEW BEVEL PROTRACTOR.

This tool is of the same general design as the Starrett No. 12 protractor, with the additional feature of having the head extend both sides of the blade. This greatly improves the usefulness of the tool, as the same angles may be transferred from either side of the frame without re-setting. Another improvement is that the turret is graduated to read both ways from 0 to 180 degrees. Mechanics will clearly appreciate this point, as direct readings may be had from the turret, indicating the supplement of the angle, as well as the angle required. The fact that there is but one zero line on the frame eliminates all possible chance of confusion as to whether acute or obtuse angles are obtained.

The head of this protractor is 7 inches long and is supplied with an accurate level attached to one side as shown by cut. The blades are hardened and graduated with heavy figures reading both ways. The heads are made with fine smooth finish.

These protractors are manufactured by L. S. Starrett Co., Athol, Mass.



New Bevel Protractor.

IRON FIRMS CONSOLIDATE.

Following the recent consolidations of of various iron and steel industries under the head of the Canada Iron Corporation, and the merger of twelve cement companies, comes the announcement of the consolidation of four large iron working companies operating six mills in various parts of Ontario, these being the Toronto Bolt & Forging Co., Toronto, having bolt mills at Swansea (Toronto) and Gananoque, and rolling mills at Sunnyside (Toronto), the Brantford Screw Co., Brantford, the Belleville Iron & Horseshoe Co., Belleville, and the Gananoque Bolt Co., Gananoque.

These four concerns have been consolidated under the name of the Canada Bolt & Nut Co., Ltd., with headquarters at Toronto, and having a capitalization of $2,500,000. Lloyd Harris, M. P., of the Brantford Screw Co., is to be president of the new company and T. H. Watson, who recently resigned as manager of the Toronto Bolt & Forging Co., in order to give his attention to bringing about the present consolidation, is to be vice-president and general manager. George Glilies, president of the Toronto Bolt & Forging Co., has disposed of his interests and is retiring.

Further details of the consolidation are not yet completed, but announcement will be made as to the composition of the board of directors after the next meeting. The question of enlarging the Swansea plant is also being considered, but the main changes likely to be made are the concentration of certain lines of work in the different plants, there being at present some duplication in this respect.

When the shop surveyor proceeds to remove a chip or spark from a sufferer's eye, he generally employs a knife blade. If he would have the blade thoroughly magnetized before beginning the operation it would often draw out the source of pain without touching the eye.

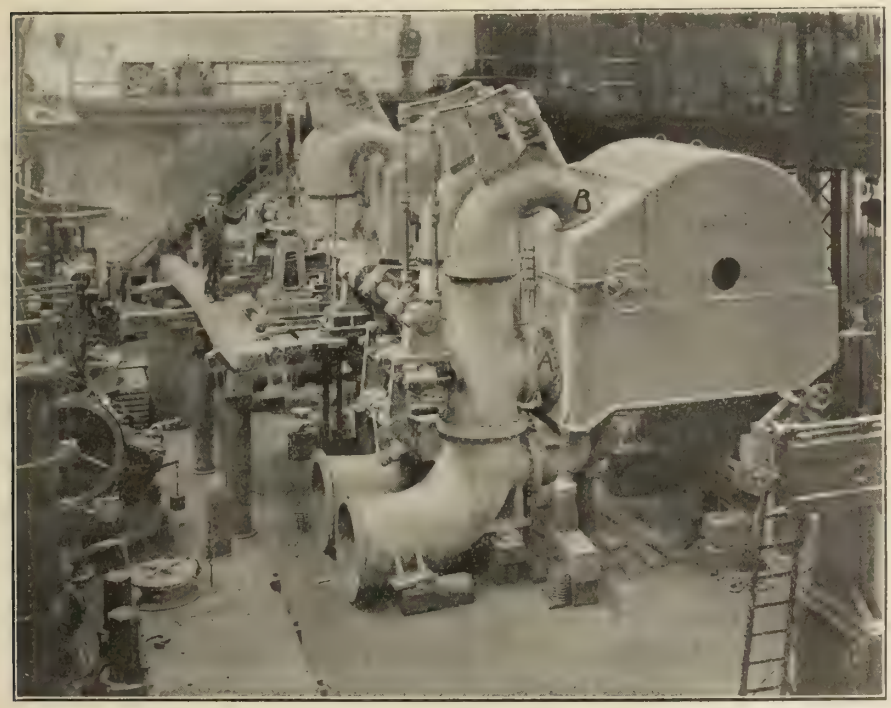
POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical.
Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

A 10,500 H.P. IMPULSE WATER WHEEL.

The illustration shows a 10,500 H.P. Impulse Water Wheel, which was built in the shops of The John McDougall, Caledonian Iron Works Co., Ltd., Montreal. It is designed to deliver 10,500 brake horse power at 200 revs. per min. under a head of 380 feet of water. It was built for the British Columbia Electric Railway Co., to be used at Lake Buntzen, driving an alternating current generator 5,000 K.V.A., 23,000 volt, 3 phase, 60 cycles.

There are four sets of buckets, all on the same shaft, two on each side of the generator. These buckets are of the ellipsoidal type, and are made of close grained cast steel ground to a smooth finish. Each set consists of 16 buckets, 24 inches wide, forming a wheel 6 feet 10 inches in diameter.



A 10,500 h.p. Impulse Water Wheel.

The water enters the casing at A and B and is directed onto the buckets through two needle nozzles. These needles are connected with the Lombard governor through the levers, and lay shaft, as shown in the illustration, and move in a longitudinal direction within the nozzle, thus changing the annular area of the orifice and the amount of water discharged. The needles do not make a hollow stream, both are so shaped as to draw the water down to a solid stream before it leaves them. The springs on the needle spindles approximately balance the force of the water on the needles, thus taking the load from the governor. Underneath the wheels, at D, are the needle relief nozzles. These are so connected to the governor that should the main nozzles become suddenly closed the relief nozzles will open and allow the surplus water to run into the discharge pipe preventing shock in the inlet pipes. The needles of these nozzles are handled by dash pots so that after being wide open they will gradually close, thus preventing shock.

The main shaft is 43 ft. 6 ins. long, 20 inches in diameter at the centre, tapering to 12 inches diameter at each end. It is made of nickel steel, hydraulic forged, oil tempered and runs in four water-cooled bearings. The four cast iron inlet pipes are 36 inches in diameter, and will be bolted to a cast steel yoke pipe, 51 inches diameter. The housings are of cast iron with machined bottom flanges.

HANDLING OILS AND TURPENTINE.

A convenient and practical means of handling oils and turpentine has been adopted by Lockwood & Palmer, Stamford, Conn. Three floors are used in the system. On the second floor are five oil tanks holding from 30 to 50 gallons each. These are used respectively for turpentine, boiled oil, raw oil, machine oil and kerosene. An iron pipe runs from each of these tanks down the elevator shaft and then through the wall partition on the first floor, where each end in a brass cock. The oil is drawn off here. The tanks are filled from the equipment on the third floor. An inclined plane, 6 feet long and 2½ feet high at the raised end, leads to a sink directly above the tanks. Each tank has attached a length of corrugated conductor pipe set at the right angle to receive the adjustable pipe which comes from the sink.

When it is desired to fill a tank the pipes are adjusted, a barrel of oil is brought from the cellar on the elevator, rolled up the incline and poured into the sink.

CANADIAN CHROME IRON ORES.

The annual report of the Department of Mines, Ottawa, for the calendar years 1907 and 1908, gives some interesting statistics regarding the output of chromite in Canada. Chrome iron ore is used chiefly for the manufacture of ferro chrome alloys and salts for pigments, as well as for linings in steel and copper furnaces.

Ferro-chrome is produced at Buckingham, Que., by the Electric Reduction Co., and shipments of the ores have been made to the Sydney and Soo steel plants, but their chief markets is in the United States. The ore ranges in value from $17 to $20 a ton, for 50 per cent. ore. Chromite is mined in the Eastern Townships of Quebec. In 1907, 7,196 tons were mined, valued at $72,000. In 1908 a little more was mined.

The world's production of chromite in 1907 was about 90,000 metric tons.

George C. Wells, assistant general passenger agent of the C.P.R. is giving a series of lectures this term to the students in the Railway Department of McGill University, Montreal, on "The Conduct of Passenger Business."

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

FOUNDRYMEN'S CONVENTION.

The annual foundrymen's convention will be held in Detroit, June 6 to 10, 1910, instead of during the week of May 30, as previously announced. The change in date was made in view of the fact that May 30 is Decoration Day, and it is doubtful if many foundrymen would have been present at that time. Arrangements are already being made for the exhibit which will be conducted under the auspices of the Foundry and Manufacturers' Supply Association, and during this week the annual meetings of the American Foundrymen's Association, the American Brass Founders' Association and Associated Foundry Foremen will be held.

CRUCIBLE MELTING FURNACE.

To meet the demands for a melting furnace having a removable crucible, the Monarch Engineering & Mfg. Co., Baltimore, has designed the type shown in Figs. 1 and 2, which is equipped with a crane for setting the pot into the furnace and for removing the same after the metal has been melted. This

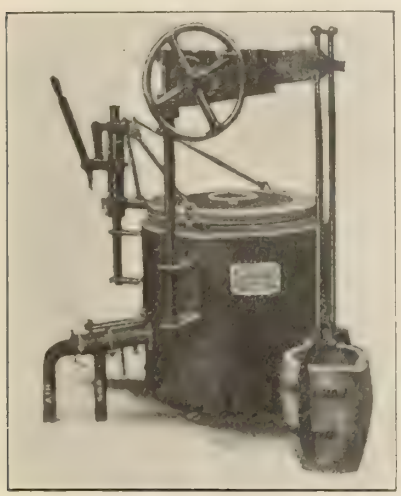


Fig. 1.—Stationary Melting Furnace With Crane in Position to Lift Crucible.

furnace is especially adapted for use in shops where the pot is lifted out and is used for pouring the metal. In Fig. 1, the furnace is shown with the crane in position for lifting the crucible into the furnace, and in Fig. 2, the pot has been raised, the crane swung over, in position to deposit the crucible with its charge into the furnace. The crucible is lifted by a chain attached to the tongs, the chain being wound up on a small drum on the spindle of the hand wheel. The furnace is provided with a swinging cover, which is moved aside by depressing the lever shown in an upright position in Fig. 1. The opening in the furnace cover permits the products of combustion to escape, and in addition can be used for introducing metal into the crucible, or for inspecting the condition of the metal as it melts. These furnaces can be arranged for installation in pits or above the floor level as

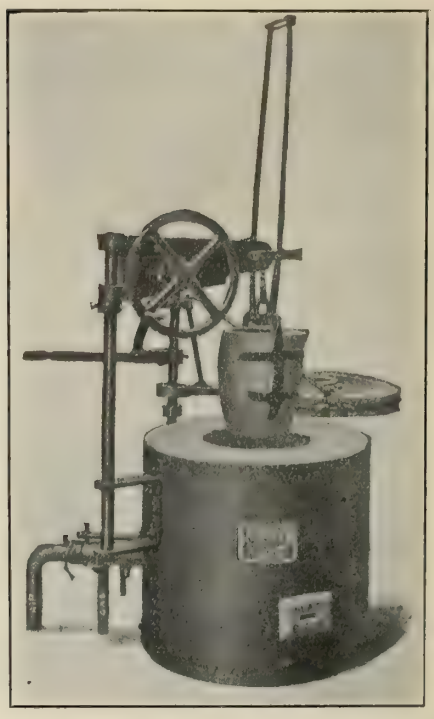

Fig. 2.—Crucible Raised and in Position to be Lowered Into Pot.

desired, and are furnished with or without the lifting crane. Gas or oil can be used for fuel.

American Foundrymen's Association.

American Brass Founders' Association.

ANNOUNCEMENT.

On behalf of our association we beg to announce that the invitation so kindly issued by the Foundrymen of Detroit to our respective bodies, to hold the next convention in that city, has been officially accepted by our Executive Boards. The date has been set for June 7th, 8th and 9th, 1910.

The hotel headquarters are to be at the Pontchartrain. Notice of details later on.

With this announcement there are sent the Proceedings of the Associations, and an apology is due for the lateness with which they reach you. The manuscript copy was ready early in August, but at that time the printing office at which our work is done was undergoing a complete transformation, and the monotype machines and new presses have taken until now to get into the running order necessary to turn out our work properly. As our members have all had such experiences in their own shops, we trust the apology may be acceptable

Detroit promises to be one of the big conventions, as from all accounts the very energetic committee, headed by Dr. Stephenson, of Cincinnati Convention fame, is busily engaged even at this early date. The exhibition to be held during the week of June 6th, also promises to eclipse everything heretofore shown, and hence visiting Foundrymen will be amply repaid, and should make their preparations early.

In the expectation of a very useful and enjoyable gathering, we remain, Respectfully,

RICHARD MOLDENKE,
Sec. Amer. Foundrymen's Ass'n.
W. M. CORSE,
Sec. American Brass Founders' Association.

December 10th, 1909.

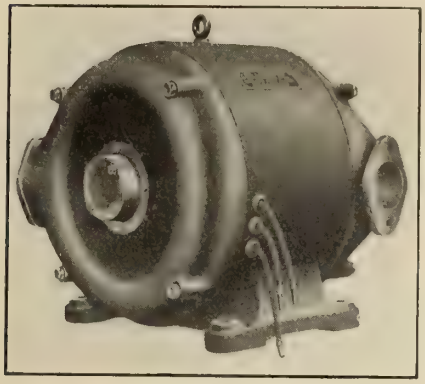
FOUNDRY MOTOR.

The motor illustrated herewith is for use in the foundry or in dirty places. It is a pipe ventilated motor, the cut showing the intake pipe at the back. This pipe is connected with the outside of the building; the other end blows the air into the shop if wished, a fan drawing the air in and forcing it out.

This motor is made for direct or alternating current, in all sizes. It is dust proof, being completely covered by a case. One of the features is that it is run with ball bearings and requires lubrication once in two years. Grease is the lubricant and is inserted by removing the small cap at the end of the

bearing. A chimney cooled motor for outside work is built along similar lines.

These motors are being placed on the Canadian market by the Lancashire



Enclosed Foundry Motor.

Dynamo & Motor Co., 152-4 Bay St., Toronto. G. E. Mason is manager of the Canadian branch of this company.

CONTINUOUS MELTING.*

By S. D. Sleeth.**

When the Westinghouse Air Brake Co. found it necessary to enlarge their plant, on account of increased business, it was decided to move to Wilmerding, Pa., and install in the foundry flask and sand conveyors. This meant that the foundry would have to run so that iron could be poured all day, instead of two or three hours in the afternoon. We knew of no plant where this was being done, so it was up to our foundry to work it out. As it required about two and one-half hours to run the heat off at that time, we decided to see how much longer we could hold the metal in the cupola and still keep it hot. The first day we put the blast on one-half hour earlier and melted the iron with the same blast pressure, but would shut the blast off for five or ten minutes and then start to blow again. This we found to work satisfactorily for that day. The second day we put the blast on one hour earlier, but this did not work so well, we, therefore, added more coke, which kept the metal hot but the melting was slower.

When we started work in the new foundry at Wilmerding we ran two cupolas, one in the morning, and one in the afternoon. We were afraid to hold over dinner hour. After running for some time in this way we decided to run one cupola all day; at 11 o'clock, or a little later, we added 200 lbs. of coke for two or three charges so that we would have an extra amount of coke to hold over the dinner hour. Our great trouble at this time was with the cupola man, as he insisted that the iron would freeze at the tapping hole, but we finally persuaded him that he would not be held responsible should this occur. We drained all the iron out at 12 o'clock and closing the slag hole with sand, stopping the tapping hole, and shutting all other openings tight, so there would be no draught. About ten minutes before starting time we tapped out all that was in the cupola and pigged it, then put the blast on full, so as to be ready when the starting whistle blew. Sometimes we have to pig two or three hundred pounds on account of the metal not being hot enough.

We had two sizes of cupola—48 in. and 60 in. inside the lining. When the heats were heavy we would run the 60 in. We had to enlarge the plant again so we took out the 48-in. cupola and installed two new cupolas, the shells being 90 in., so that we could line them up to 78 in. if required. We have them lined at the present time to 70 in. When running full, i.e., night and day, we melt 280 tons, running each cupola about ten hours. We have operated one cupola from Friday night at 6 o'clock until Saturday noon of the following day, closing down at 11 p.m. for one-half hour for lunch, and again at 6.30 in the morning for three-quarters of an hour for breakfast. This is rather hard on the lining so we do not make a practice of it.

We have tried a great many experiments with cupolas, but as yet have been unable to find any that will give better results than the double row of tuyeres —the upper row about 10 in. above the lower. It is not necessary to keep the upper ones open all the time. Our blast pressure is about 11 ounces in the cupola bustle. We use a fan for blast. When running full we melt ten to eleven lbs. of iron to one pound of coke.

In charging the cupola we are very careful to have the charge level. We charge the pig by hand and the scrap is dumped in from a buggy through a door above the regular charging door. All the charges are the same from beginning to the end of the heat. As the iron must come very soft and uniform we do not charge more than 4,000 lbs. at one time. For a smaller cupola the charge would naturally be less.

To sum up our experiences. I would advise: See that the coke bed is burning even all around, then charge just as you would for an ordinary run, allowing an extra amount of coke for the dinner hour. After running about one hour, open the slag hole and keep it open, except during the dinner hour. Use about 40 to 50 lbs. of limestone to one ton of molten metal—better to use too much than too little. Have the cupola shell large enough, as it is easy to put in an extra lining for smaller heats.

* Paper read before the American Foundrymen's Association. In the February issue will be given a discussion on this subject by Geo. K. Hooper, M.E., New York City.

** Address: Wilmerding, Pa.

TRADE LITERATURE AS ENGLISH TEXT-BOOKS.

The following unique scheme of teaching English in the Cuban public schools of Habana Province, instituted by the supervisor of English, Miss Abbie Phillips, is reported from Habana:

Miss Phillips has asked all the representatives of English and American manufacturers in Habana to supply her with their catalogs, and especially those which are profusely illustrated. These catalogs are distributed among the schools and students, and a large part of the time devoted to English instruction is used in explaining the names and uses of the articles illustrated.

This seems to offer a rare opportunity for a great deal of free advertising for those manufacturers who are willing to send their illustrated catalogs and pamphlets to the supervisor. The great value of this method of teaching is that the rising generation of Cuban youth will learn the names and uses of the articles illustrated at the most impressionable age, which in the near future will reflect to the advantage of those manufacturers. Miss Phillips states that any kind of catalog is welcome, whether dealing with office supplies or machinery.

It is suggested that interested manufacturers and exporters send a half dozen sets or more of their illustrated literature to Miss Abbie Phillips, Supervisor of English, Obrapia, 57, Habana, Cuba.

PROTECTING POLISHED STEEL WORK FROM RUST.

Polished steel work may easily be protected from rust by the application of the following compound:

Lard .... 6 parts
Rosin .... 1 part

The two ingredients are melted together and stirred until cold. The rosin prevents the mass from becoming rancid and also acts as an air-tight film. If rubbed upon a polished steel surface, even very thinly, it effectually preserves and protects the polish. It is easily removed by gasoline or kerosene—Brass World.

W. G. Lotte, instructor in forge practice at the college of engineering, University of Wisconsin, for 17 years, has been granted one year's leave of absence. He will spend the time as special inspector of steel for the International Harvester Co., visiting its various plants in the United States and Canada.

Steel Foundry of Vancouver Engineering Works

This New Steel Foundry is the Only One in Canada West of the Great Lakes—Equipment Includes Up-to-Date Cupola, Converter, Cranes, Etc.

The demand for steel castings in the western part of Canada has increased with the rapid development of that section. Machinery used in the lumber and mining industries must be constructed to withstand very heavy work. Steel castings, which enter largely into the manufacture of this class of machinery, had to be shipped from the eastern part of Canada, or imported from the United States, or England. This was expensive because of high freight rates and long deliveries.

Realizing the growing need in that portion of the Dominion, early in 1909, the directors of the Vancouver Engineering Works decided to add a steel foundry to their plant at Vancouver. The side blown converter for making steel was adopted.

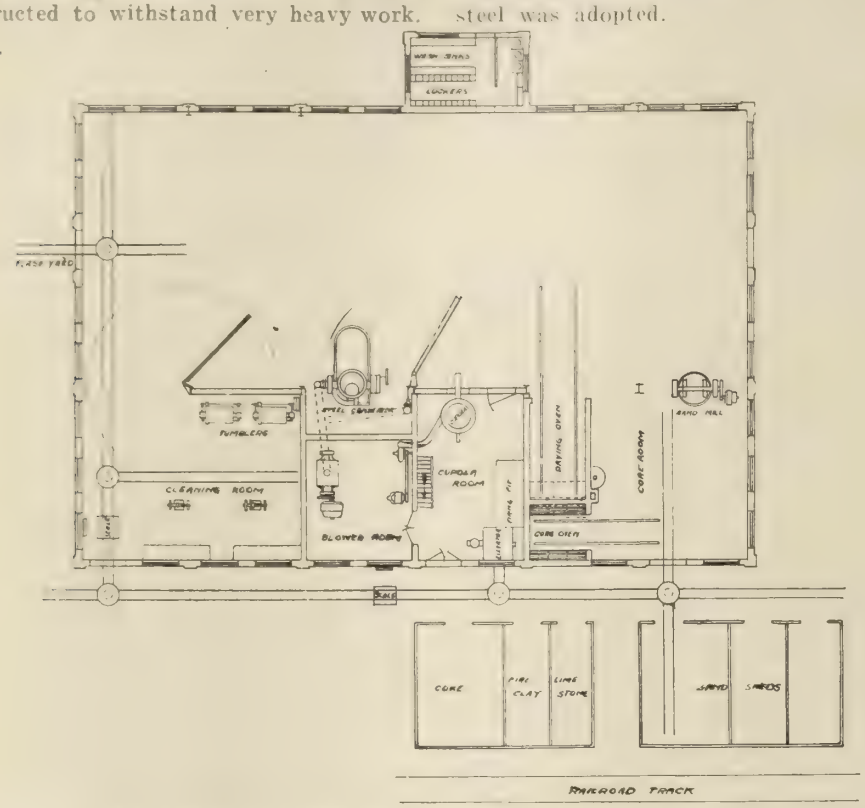


Fig. 1.—Layout of Steel Plant, Vancouver Engineering Works.

In May, 1909, the Whiting Foundry Equipment Co., Harvey, Ill., was commissioned to design and equip the steel foundry according to the most up-to-date practice. Erection of the plant was commenced in June, and the equipment installed during the following September. The first flow of steel was successfully made October 12th, under the supervision of the Whiting Foundry Equipment Company's Steel Foundry Engineer.

The plant has a present capacity of eight tons per day, and is so designed that extensions for handling double that capacity can be made as required, without interrupting the operation of the present foundry. It is of steel construction throughout, having a main bay 120 feet long, and 50 feet wide, with a side bay 120 feet long, and 50 feet wide,—as shown on the ground plan—Fig. 1. The side bay is designed to provide the most compact grouping of the melting and converting department, the core room, sand mill, and cleaning department, without in any way interfering with the economical operation of each. In the design, every effort was made to secure a continuous system, in order that the raw material might be converted into finished castings without any reverse movements. The steel foundry is so arranged in the plot of the general plant, that the movement of all departments is in the direction of the castings store house.

The Cupola.

The cupola is the standard Whiting No. 4, and the height from floor level to top of the stack is 35 feet. In order to properly charge the converter, the melting capacity is about seven tons per hour. The cupola charging floor is 22 feet long, and 20 feet wide, and is served by a 2-ton electric elevator, having a lift of 16 feet. In order to facilitate the handling of melting stock, an industrial track of 24 inch gauge connects the elevator with the stock yard.

Iron is tapped from the cupola into a 6,000 pound ladle, carried by a pneumatic jib crane of 4 tons capacity, as shown in Fig. 2. Two taps are made to obtain a full charge for the converter. This is done to avoid holding the molten iron in the hearth of the cupola,

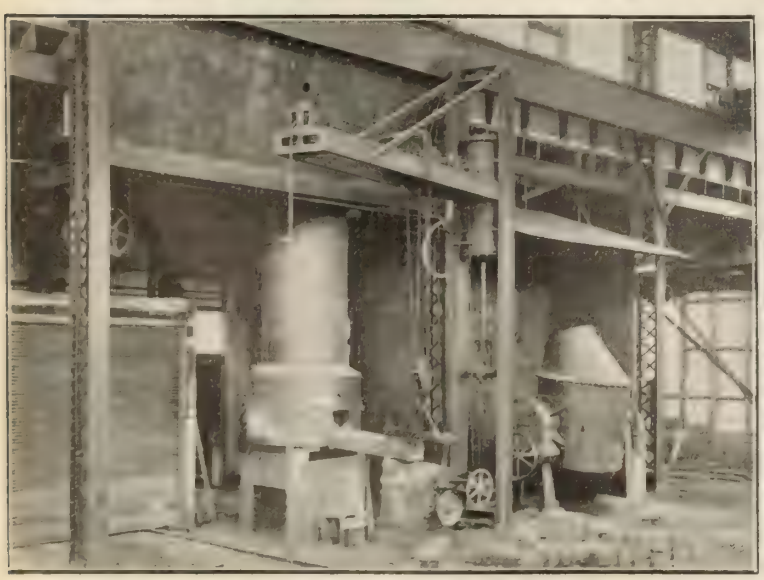

Fig. 2.—Jib Crane of 4 Tons Capacity.

Fig. 4.—Ladle Lowered to Receive Finished Steel.

where it is exposed to the incandescent coke from which it will absorb sulphur, especially if the manganese content is low. After the ladle is filled, the jib crane hoists it to the pouring position, shown in Fig. 3, and the iron is transfered to the converter, to be blown into steel.

Since no phosphorus or sulphur can be removed, owing to the acid lining of the converter, it is necessary to melt an iron running low in these elements, the maximum limit being 0.04 per cent. for each. The manganese content ranges from 0.60 per cent. to 1.50 per cent. The cupola charge is so proportioned as to give about 1.00 per cent. of manganese, this limit being set because it counteracts the affinity of the iron for the sulphur in the coke, and also minimizes the wear upon the converter lining. As the percentage of silicon in the cupola charge should be from 1.80 per cent. to 2.00 per cent. in the iron it ranges from 1.20 per cent. to 3.50 per cent. The extensive manufacture of boilers, tanks, etc., gives this company a heavy stock of punchings and clippings to draw upon for the cupola charge. In order to produce steel castings of high grade, careful attention is given the sulphur and phosphorus limitations.

The Converter.

The converter, having a capacity of 2 tons, is of the standard Whiting type. It occupies a floor space 20 feet by 12 feet, and is separated from the remainder of the side bay by a steel curtain wall. It is carried on cast steel trun nions, which revolve in heavy cast iron standards, and spans a concrete pit into which the ladle is lowered to receive the finished steel, as shown in Fig. 4. A large hood is suspended above the converter, to carry the fumes outside the building. The height of the converter is 10 feet, when in blowing position. It is lined with a composition of ganister, sand and fire clay, rammed around a wood form. This lining, if repaired when necessary, will give at least 180 or 200 blows.

Iron from the cupola is poured into the converter, which is then turned to an upright position for blowing. The air pressure ranges from 3 to 5 pounds a square inch, it being regulated by a valve at the operator's platform. The blowing operation requires from 15 to 20 minutes, varying with the percentage of metalloids in the iron. It is necessary that the time be as brief as possible, as upon the rapidity of the blow depends the temperature of the bath. Fig. 5 shows the converter during the progress of the blow. Reduction in the weight of metal is about 18 per cent. The steel comes from the converter at 1,700 degrees, centigrade,—a temperature insuring sufficient fluidity to yield sharp, sound castings of light section.

Back of the converter, and on a level with the foundry floor, is the blower room, which is equipped with a positive pressure blower for the converter, and a steel pressure blower for the cupola. The positive pressure blower built by the P. H. & F. M. Roots Co., is a No. 5. It is belt connected to a 75 h.p. Allis-Chalmers-Bullock alternating current motor. The steel pressure blower, built by the B. F. Sturtevant Co., is a No. 6, belted to a 10 h.p. A.-C.-B. alternating current motor.

The blast main to the converter is in a straight line to insure the minimum loss due to friction. A 14-inch blast pipe connects the cupola with the blower. Regulation of the blast for the cupola is accomplished by means of a standard blast gate.

Core Room.

The core room, core oven and mold drying oven are in the side bay, adjoining the cupola room, and cover an area 40 feet long, and 30 feet wide. The mold drying oven, which holds two cars, is 18 feet long and 10 feet wide, and is fitted with a Kinnear roller curtain door. The core oven is 10 feet by 10 feet, equipped with side shelves for cores, and has a swinging steel plate door. Coal is used for fuel.

Adjoining the core room, is the sand mill room, with a 72 inch mill, built by the Vancouver Engineering Works, Ltd. This mill is of the undergeared type, and is belt driven by a 25 h.p. A.-C.-B. alternating current motor. A pneumatic sand shaker, built by the Hanna Engineering Co. is between the sand mill and core room.

The cleaning room adjoins the blower room, and opens into the main bay. The equipment consists of a cold saw of the 2-B type, and two power hand saws, built by the Quincy, Manchester Sargent Co. Two type C Diamond emery grinders, built by Diamond Machine Co., provide ample facility for grinding the present out-put of the foundry. Provision has been made for the future installation of an annealing furnace.

The Vancouver Engineering Works, Ltd., manufacture an extensive line of logging and saw-mill machinery, all types of boilers, burners for saw-mills, and mining machinery. F. L. Leighton is general manager and instalations were made under his supervision.

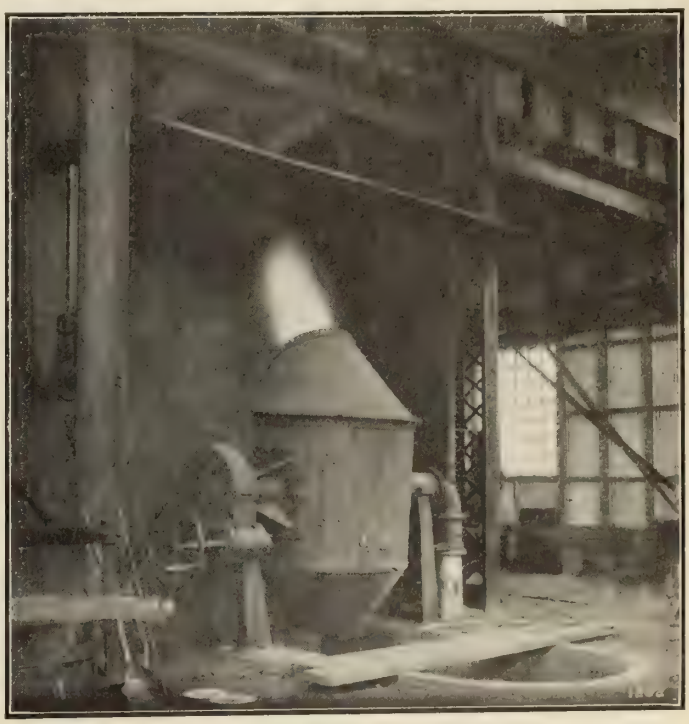

Fig. 5.—Converter During Progress of the Blow.

LOST HIS SUIT CASE.

L. L. Anthes, of the Toronto Foundry Co., has returned from a trip to Calgary and Edmonton, during which he was a member of two hunting parties. While in Winnipeg he, along with Alex. and Garnet Irvine, of the Standard Plumbing Co., and Sam Tait, manager of the plumbing department of the J. H. Ashdown Co., made up a duck shooting party, which visited Findlay, Man., Bob Green, master plumber, of Winnipeg, also being along. He later on went after big game south of Port Arthur, getting a deer, and Alex Cameron, Fort William, a moose. H. Anderson, Port Arthur, also got a shot at a moose, but failed to bring him down. The best Ed. Higginbotham, of Fort William, could get was a snapshot.

While at Calgary "Lawrie" was initiated into the society, which has recently gained many members in the west, "The Native Sons," the password to whose meetings is the "Indian Sign." Several members of the society came down to the depot to see "Lawrie" off on his trip east, and while waiting for the train, some one suggested that they have a cigar, so the party went across the road. On the return trip, however, Anthes and his suit case got separated, but he took the train on condition that his friends would send the baggage along on the next train.

"The best laid plans" oft go astray, however, and though "Lawrie" telegraphed from Winnipeg, and went on his hunting trip at Port Arthur, that suit case hasn't arrived yet, and as it contained his camera his friends have to take his word for it that he got "all the law allows" on his shooting expedition.

MOLDING A VALVE SEATING.

By G. Buchanan.

It sometimes happens that the molder turns out some piece of work for which he is really not responsible, although, when the casting is returned to the foundry and another piece is made which turns out good, the remark is passed, "Why didn't you make the first casting like this?" The answer will of course depend on many circumstances, but taking a case in point—that of a valve seating shown in Fig. 1, having three machined faces, L, K, and M,—the answer is that, not knowing the parts to be machined were as shown on the sketch, no precautions were taken to ensure these parts coming out clean. It is only when viewing the returned casting that the molder knows anything about these machined faces, as the pattern supplied (Fig. 2) gives no information in this respect. It would be a great help to the foundry if engineers who get their castings made out were particular in having their patterns marked plainly where they are machined, either by printing, say, the word "Bright," or painting all machined parts a different color, attention being drawn to this point on the order accompanying the patterns.

The remedy in this instance is to cast the piece on its side, so that all bright faces are vertical. Fig. 3 is a sectional view of Fig. 4, which latter is a cross-section of the mold complete.

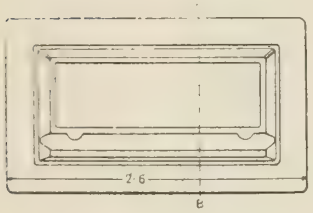

Fig. 1.

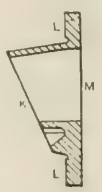

Fig. 3.

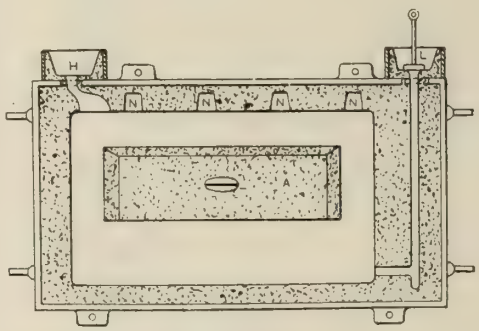

Fig. 2.—Molding a Valve Seating.

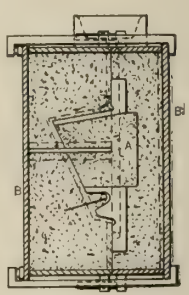

Fig. 4

A is a dry-sand core; B, B are plates which are bedded on to the bottom and top parts of the flask when the mold is being rammed up. These plates are clamped as shown in Fig. 4. Two holes are cut in the flask at the joint, H for a riser and L for the runner. N, N, N, N are dummy risers which take any dirt out of the top flange.

The mold is made in the same way as before when the casting was returned, the same tackle being used. The alterations needed were the holes cut in the flask joint and the two plates bedded as shown to enable the mold to withstand the side pressure when being poured. These pieces weigh 300 lbs., and are made in batches of twelve at a time.—Mechanical World.

MELTING FURNACES.

The Monarch Engineering Co., Baltimore, Md., engineers and specialists in general oil and gas fuel for plant furnace equipment, in issuing a catalogue have included in it useful information for foundrymen. While the "Steel-Harvey" Crucible Tilting Furnace, the Monarch Portable Tilting Furnace, Monarch Non-Tilting Furnace, blowers, etc., are used as illustrations, and the catalogue is an advertisement for these special lines, yet there is a lot of useful information which should be perused by those interested. An article on "The 'Use' and 'Abuse' of Crucibles," contains suggestions worth perusing. The footnote of the opening page, "All goods manufactured and shipped by us are guaranteed as represented, otherwise subject to return at our expense," gives a reader of the catalogue, an impression of genuineness in the contents of the catalogue, and in the goods described.

MAKING PREPARATIONS AT PITTSBURG FOR FOUNDRYMEN'S CONVENTION IN 1911.

The chairmen of the different committees, which will be in charge of the various arrangements for the annual convention of the American Foundrymen's Association at Pittsburg in 1911, were announced as follows at the regular monthly meeting of the Pittsburg Foundrymen's Association, Monday evening, Dec. 6—General committee, Jos. T. Speer, of the Pittsburg Valve, Foundry & Construction Co.; reception, E. A. Kebler, M. A. Hanna & Co.; smoker and get-together, E. D. Frohman, S. Obermayer Co.; finance, J. S. Seaman, Seaman, Sleeth Co.; plant visitation, W. A. Bole, Westinghouse Machine Co.; convention, H. E. Field, Mackintosh, Hemphill & Co.; ladies' entertainment, O. W. Mason, Midland Steel Co.; boat ride, F. H. Zimmers, Union Foundry & Machine Co.; press, W. B. Robinson, The Iron Trade Review.

Louis Lavoie, formerly on the personal staff of the general manager of the I. C. R., has been appointed general purchasing agent of the road with headquarters at Ottawa, Ont., Canada.

CANADIAN MACHINERY AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

SUBSCRIPTION RATE.

Canada, United States, $1.00, Great Britain, Australia and other colonies 4s. 6d., per year; other countries, $1.50. Advertising rates on request.

Subscribers who are not receiving their paper regularly will confer a favor on us by letting us know. We should be notified at once of any change in address, giving both old and new.

Vol. VI. January, 1910 No. 1

RAILROAD BUYING A BAROMETER.

No better indication of the prosperity of a country can be found than in the equipment buying of its railroads. When the corporations are launching out into fresh rolling stock, and are providing for increased traffic then there can be no doubt that the trade barometer is favorable. But if the buying is shut down, as was the case last year, then there is no doubt as to the conditions being unfavorable. If railroad economizing tends further to depress trade, railroad liberality has the opposite effect. Not only does it mean that money will be circulating more freely, but that others are encouraged by the action of men who are recognized as leading guides of trade prospects.

For some time now our railroads have been buying heavily, confident in the prosperity wave that has arrived and anxious to be prepared for further improvement. The rolling stock has been greatly added to during the summer and the winter is to be no exception. The C.P.R. are making extensive preparations at their Angus shops, Montreal, to prepare for next year's traffic. They have commenced by placing an order for 15 freight engines and three passenger engines of the Pacific type. Upwards of 150 passenger cars are also to be renovated, and eight new sleepers constructed. A record winter of work is anticipated at the Angus shops, and it is evident that apart from the benefit of this money circulating we have the satisfaction of knowing that much heavier traffic is expected next year.

The Grand Trunk and Grand Trunk Pacific are also making strenuous arrangements as to equipment. During the past four months they have added to their rolling stock at the rate of about $1,000,000 a month, while orders for new engines and cars have now been given, which will ensure an even greater rate of progress during the balance of the year. Locomotives and cars are continually arriving and great improvements have been made to the rolling stock. The Grand Trunk Pacific has completed its line between Fort William and Winnipeg, the line being now complete from Lake Superior to Edmonton.

Nor is the Canadian Northern less progressive. That road increased its equipment by 25 locomotives, 1,950 box cars, 500 flat cars, 125 stock cars, 40 cabooses, 16 baggage and mail cars and 15 passenger cars, every one of which was built in Canada. The Ontario division of the road will build during this winter a line to Ottawa, giving thereby a through line between Toronto and Quebec; and the bridging of the gap between Sudbury and Port Arthur (now under construction) will connect the eastern and western divisions, and give the Canadian Northern entrance to the larger centres of the country. West from Edmonton the same line is surveying a route that will take it to New Westminster, so that it is but a matter of months until the third transcontinental railway will connect the Atlantic seaboard with the Pacific.

There cannot be much doubt as to the confidence of the railroads in the future business conditions of the country. The most sceptical can take heart when the shrewd business men controlling these interests make preparations for a greater strain on their rolling stock, for there is this evident fact that unless the country is prosperous, traffic cannot be.

"GRAFT AND GOOD ROADS SEEM STRANGE BEDFELLOWS."

There appeared in a recent issue of the Toronto Globe what appeared to be an authentic account of an investigation of certain charges of graft in connection with the administration of the Oxford county roads system. The article was published under the somewhat startling caption, "Graft and Good Roads Seem Strange Bedfellows." In the course of the evidence reported it was stated that one Jas. A. Vance, "agent of the Hamilton Bridge Works Co.," had sworn that he paid Reeve Sutherland, of East Zorra, $50 to secure his signature to a contract for a bridge.

The Hamilton Bridge Works Co. affirm that this man Vance was not an agent, is not an agent, and will never be an agent, of the Hamilton Bridge Works Co., and while the Globe is to be congratulated on any steps it takes to expose graft, it would seem that steps should be taken to verify statements made.

It seems that Jas. A. Vance for a number of years was a broker or contractor, going out and taking contracts on his own hook and then buying the steel where he chose. During the past few years the steel for a number of bridges was purchased from the Hamilton Bridge Works. This company on a few occasions gave him contracts to erect some small bridges when he happened to have work in the neighborhood and when it was inconvenient for the company to send its own gangs.

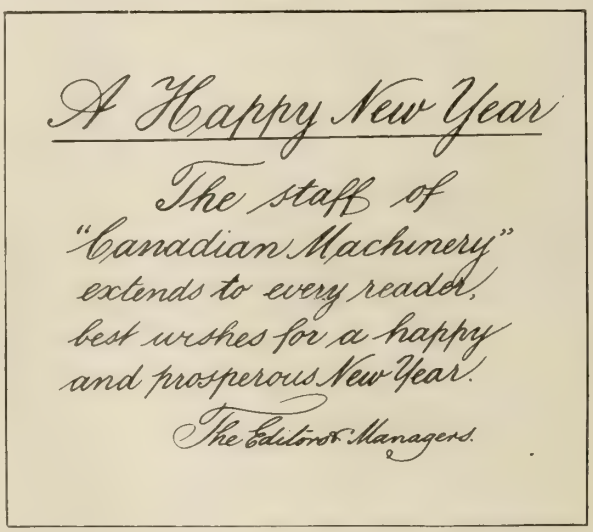
A letter received by the Hamilton Bridge Works Co. from Judge Finkle, chairman of the investigating committee, says that there was no evidence whatever brought out to show that this man was connected with the Hamilton Bridge Works Co. It was therefore unfair, to say the least, for the Globe to publish such an article before endeavoring to find out the full facts. It is a great injustice to the company mentioned to connect them even indirectly with shady dealings. This company has a reputation for fair dealings, not having to resort to any mean or petty acts to secure contracts.

FACTS ABOUT OURSELVES.

Canadian Machinery has entered the sixth year of publication, having, we believe, the confidence of the mechanical men of Canada. From the first, when Canadian Machinery was launched into a distinctly new field, the paper has been a success. From a sixty-four page paper, it has grown to a ninety-six page paper. It is recognized that the support a paper receives from its advertisers is positive proof of its value. In December, 1905, there were thirty-four pages of advertising, while four years later, in December, 1909, there were fifty-eight pages.

When Canadian Machinery was started in January, 1905, there was no machine tool paper in Canada. It is still the only paper in Canada catering exclusively to the machine tool and foundry trades. The quick and ready response with which Canadian Machinery was received by the mechanical men of the Dominion showed that its future was assured. That their interest has not flagged is shown by the fact, that not only have practically all the original readers renewed their subscriptions, but the list has grown until now Canadian Machinery reaches over 90 per cent. of the machine shops and foundries of Canada.

The industrial life of Canada has awakened and factories have been erected by the score during the past year, while a great number more have been planned for 1910. More than twenty salaried subscription men are covering Canada simultaneously, from coast to coast, every city, town and village being visited each year. These men must show results or we want to know the reason why. Besides these men we have a great number of shop agents, and every industrial concern, superintendent, foreman, purchasing agent and master mechanic has the paper brought regularly before his attention. The directors of embryo concerns are also approached, so that we are maintaining a list of paid-up subscribers in Canada, which includes the men who can influence the buying of machine shop and foundry equipment and supplies.



* * *

With the growth of the paper and its increase in popularity among Canadian mechanical men generally, the editorial staff has been increased and greater efforts are being put forward to increase the value of the paper. Results speak for themselves and comparisons of issues as they appear, with previous ones, show a growth in the class of editorial matter published. This has been accomplished by the most diligent efforts on the part of the publishers and by the suggestions received from time to time from friends of the paper. We are always on the outlook for these suggestions whereby the paper may be made of greater interest, and we value the criticisms of our readers.

Among our contributers during the past year we have numbered some of the best known mechanical men of Canada and numerous excellent articles will appear during 1910. We spare no expense to get the mechanical public what they want and we are ever looking for good, live, reliable articles. In every issue is a good fund of information and ideas for manufacturers, superintendents, foremen and mechanics. As a result, subscriptions continue to come in from all over Canada and our representatives in the various provinces are meeting with excellent results.

* * *

Discriminating advertisers who know where to get results are placing their business with us and each year has shown a growth over the one previous, showing the confidence our patrons have in the advertising power of Canadian Machinery.

While the main function of our advertising pages is to provide a place wherein the advertiser may print his message, we realize that many advertisers, lacking time or inclination to produce good "copy," fail frequently to make the most of the opportunity which Canadian Machinery provides. For that reason we maintain an Art and Advertising Department whose business it is to cooperate with such of our advertisers who desire it, in preparing good advertising copy.

Perhaps the most striking illustration of the efficiency of this department is contained in the fact that many of our advertisers are using the copy prepared for them by the Art and Ad. Department, in other publications besides Canadian Machinery.

* * *

A few kind expressions of opinion received at our office during the past few days, entirely unsolicited, are illustrative of the position held by Canadian Machinery among mechanical men.

W. Dalgheish, Sidney, Man., writes: "I look forward to its monthly visits with a good deal of pleasure, and enclose $1 to place to my credit. Wishing you continued success."

The following letters were received recently from British Columbia subscribers, at our Vancouver office, 11 Hartney Chambers by H. Hodgson: "Canadian Machinery is a credit to Canada. It is one of the best machinery papers I have seen. It is of interest to every mechanical man whether he be employee or employer."

"Yes, I got the paper all right and like it fine. If every issue is like the October number you can count on me as a permanent subscriber. Moreover, I will get others for you. When you were talking to me I must confess I had no confidence in the paper, but it is ahead of English and United States papers for Canadian mechanical men."

David Williams, one of our eastern representatives, after a tour of New Brunswick, Prince Edward Island and Nova Scotia writes: "There are very few managers or foremen who are not on our list. All of them speak well of Canadian Machinery, especially lately. I have told a number of them that we propose enlarging the department of "Machine Shop Methods and Devices," and they all approve of it. That department has been good lately. The article on the Moncton shops was very much appreciated down here." Mr. Williams is now making a complete tour of the British West Indies for us.

New Interesting Type of Boring and Turning Mills

The Colburn Machine Tool Co., Franklin, Pa., Have Just Brought Out An Entirely New Line of Vertical Boring and Turning Mills, the "New Model."

The "New Model" vertical boring and turning mills recently placed on the market include many new features in their design. There are five sizes in the entire line, 42, 48, 54, 60 and 72-inch swing. With the exception of the method of driving the table, the same features are incorporated in all sizes and a description of any one size practically describes all the others. All sizes are built with two swivel heads, and the three smallest sizes with turret heads as desired.

Referring to Fig. 1, the table spindle has a massive angular thrust bearing which makes it self-centring, and, together with the large, straight, upright bearings, effectually resists vertical, angular and horizontal strains. All bearing surfaces of the spindle are lubricated from one sight feed oil cup.

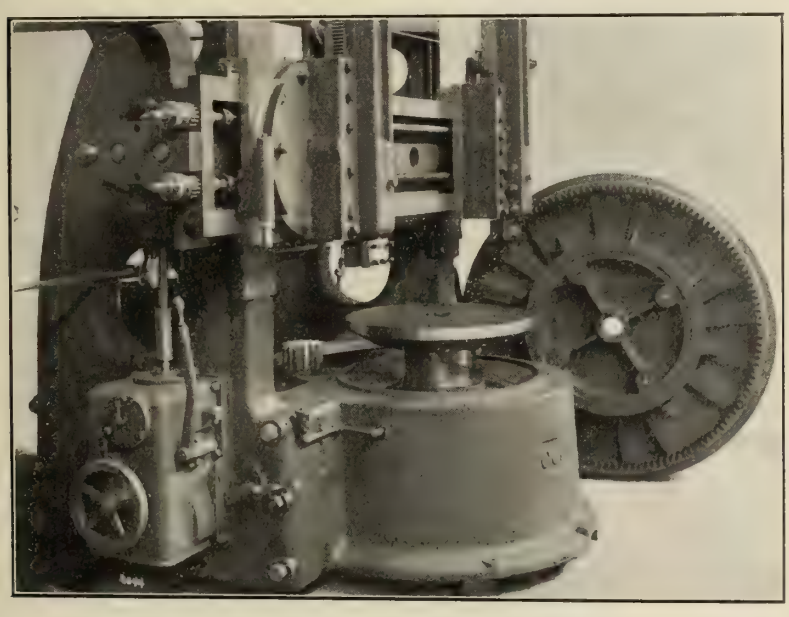


Fig. 1.—Detail of Table Spindle Bearing and Internal Drive as Used on 60 and 72 Inch New Model Mills.

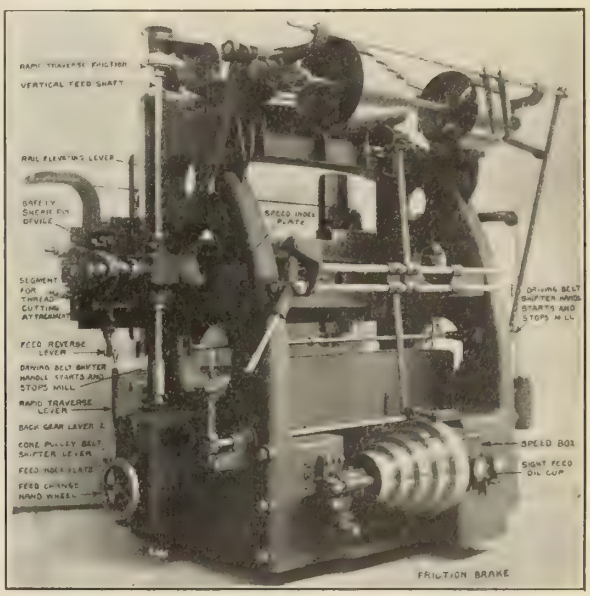

Fig. 2.—Rear View New Model Mills, Colburn Machine Tool Co.

Driving Mechanism.

The drive is by means of five-step cone pulleys of large dimensions, thence through the speed box, which contains the back gears and positive clutches, which are constantly immersed in a bath of oil. The back gears are engaged and disengaged by means of positive clutches inside of speed box and operated by lever Z, conveniently located at sides of machine, shown in Fig. 2. Five speeds are obtained with the back gears out, and five more with the back gears in, making ten speeds in all in geometrical progression.

A belt shifter (Fig. 2) is furnished on these mills, by means of which, operated with one hand, the belt can be changed from one step of the cone pulley to another with great rapidity and without any injury to the belt. In actual operation the entire range of speeds obtained with the cone pulleys, from the slowest to the fastest and back again, stopping momentarily on each step, has been made in eight seconds. By changing the back gear lever Z, which is in close proximity to the handle which operates the belt shifter, another run of five additional speeds is obtained. A speed index plate, located on the housing directly above the back gear lever Z, indicates the right step on cone pulley for belt and position of clutches inside of speed box to give the correct speed of table in revolutions per minute.

Fig. 3 shows some of the details of the new model boring and turning mills. A is the right-hand ram and tool holders, B is the friction cone used on foot brake. This has three hard maple shoes or wedges, which are specially prepared by being treated in paraffin. C is a friction cone with cork inserts used on power rapid traverse. These frictions are on the upper end of the vertical feed shafts. D is a quick-adjusting feed clutch, used on the ends of both feed rods and screws on the ends of both rods and screws in cross rail.

The feeding mechanism for each head is contained in a separate case, one on each side of the mill. By turning the hand wheel one revolution, five changes of feed are obtained. A movement of the multiplying lever changes the combination of gears, and another revolution of the hand wheel gives five more changes, making ten in all. The vertical feed shaft extending upward from each feed case engages with mechanism on each end of rail, which conveys motion to the horizontal rods and screws in cross rail, which operate the heads vertically and horizontally. Quick-adjusting positive clutches are used, as shown by D in Fig. 3, which enable the operator to instantly change feed from vertical to horizontal and vice versa. Either feed can be reversed instantly by the feed reverse lever, shown at each end of rail.

Rapid traverse of the tools, horizontally, vertically, and in angular directions, is obtained from the same vertical shafts as the feed, the manipulation being by a vertical lever attached to the front of the feed case, marked "Rapid Traverse Lever" on Fig. 2. This lever has two operating positions: forward and back. The gear feed is always engaged when the lever is in the back position, and the tool will feed in the direction determined by the position of the feed reverse lever at the end of cross rail.

The rapid traverse is always engaged when the lever is in the forward position, and the tool will travel rapidly in the opposite direction from the gear feed. It is impossible for the operator to throw the rapid traverse in the wrong way, and

there is no chance for an accident to occur.

The motion for the rapid traverse is obtained from the horizontal shaft at the top through friction cones having cork inserts. (see C, Fig. 2). The rapid traverse in connection with the final adjusting collars does away with the necessity of hand cranking, although the ends of the rods and screws in cross rail are squared so that a crank can be used in an emergency or when preferred.

Final Adjusting Collars.

Although the rapid traverse is an indispensable feature, enabling the operator to quickly move the tools in any direction, it does not allow a fine adjustment to be made. In the Colburn mill both feed screws and rods in the cross rail are splined and each has a capstan collar slidably fitted thereto with keys, which fit the spline so that by turning the capstan collars with a small lever furnished for this purpose, the rods and screws are turned also, (see detail, Fig. 4).

A safety shear pin device, Fig. 5, placed on the rear of each end of the cross rail prevents injury to feed mechanism in case the heads are accidentally run together.

Figure 6 shows a new model mill equipped with constant speed motor, mounted on bracket and belted to friction clutch pulley on jack shaft. Friction clutch allows mill to be stopped and started without stopping motor.

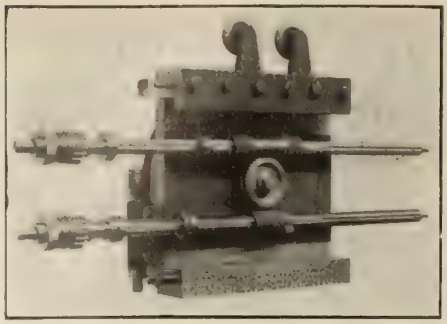

Fig. 4.—Rear View of Saddle for Swivel Head on New Model Mill.

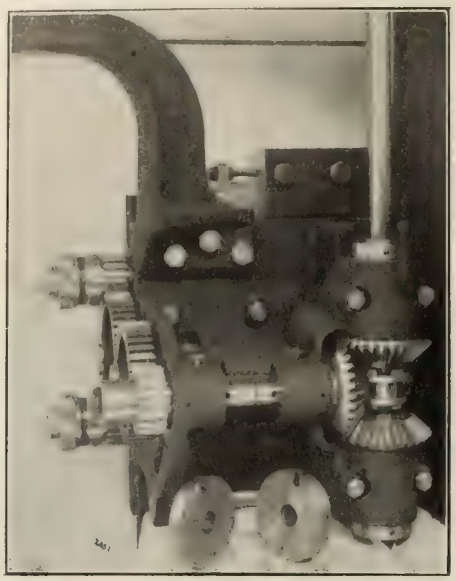

Fig. 6.—View of Safety Shear Pin Device.

WESTERN CANADA RY. CLUB.

The regular November meeting of the Western Canada Railway Club was held in the Royal Alexandra Hotel, Winnipeg, Nov. 8. H. H. Vaughn, assistant to vice-president, C.P.R., Montreal, read a paper on "Fuel Economy on Testing Plants and Railroads." Grant Hall, superintendent motive power, C.P.R., Winnipeg, occupied the chair. On Dec. 13, H. B. Lake, chemist, C.P.R., Winnipeg, presented a paper on "Water Supply."

The next regular monthly meeting of the club will be held in the Royal Alexandra Hotel, Winnipeg, on January 10th, at 8 o'clock. A paper will be read by A. E. Cox, storekeeper, Canadian Northern Railway, on "The Stores Department and its Relation to the Other Departments." There will also be the continued discussion on "Water Supply," and "Copper versus Steel Fireboxes."

John Stewart, heretofore locomotive engineer on the I. C. R., has been appointed acting master mechanic of the Eastern Division with offices at Moncton, N.B., vice Mr. N. L. Rand, master mechanic, placed on the pension list.

Do your work well to-day and you won't have to do it over again tomorrow.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

The telephone machine factory at Waterford has begun operations.

The Wabi Iron Works, Temiskaming, plan extensions for this year.

The C.P.R. will probably build a new roundhouse at London, in the spring.

The Parkin Elevator Co., Galt, have decided to open a branch office in Winnipeg.

It is officially announced that the C.P.R. will enlarge their Montreal roundhouse next spring.

The Stewart Machinery Co. has applied for a permit to erect a $30,000 warehouse at Winnipeg.

Extensive improvements have been made to the office floor of the Thos. Davidson Mfg. Co., Montreal.

The Ontario Engine & Pump Co. have decided to locate at Calgary and will buy a big block next spring.

The Regina Machine & Iron Works will have a solid brick or reinforced concrete building put up next spring.

John Dennis, one of Lindsay's pump manufacturers, has moved into his new premises, a modern building.

Work has been commenced on a 13-foot addition to the Provincial Steel Company's plant at Cobourg.

The Page-Hersey Steel Tube Works, Welland, are expected to start work next month with two hundred men.

The Nova Scotia Steel & Coal Co. has struck a 30-foot seam of iron ore on their Wabana property in Newfoundland.

Bonuses aggregating $300,000, have been offered to any shipbuilding company erecting a plant on Halifax harbor.

The Western Stove Mfg. Co., with headquarters in Portland, Ore., is likely to build a plant at Calgary, for their Western Canadian trade.

The Ontario Iron & Steel Co.'s plant at Welland, which formerly imported its steel billets from the States, are now making their own.

The 1000 Island Boat & Engine Co., Morristown, has $10,791.27 worth of orders for spring delivery. They have now a force of over fifty.

The National Iron Works have secured a permit for their first building on the Ashbridge Bay site, Toronto. It is a brick foundry estimated to cost $20,000.

The first range manufactured by the new stove firm, The Stanford Steel Range Co., Brantford, was recently on exhibition in Howie & Teely's window there.

The Dominion Iron & Steel Co. will have built for next season two 10,000-ton steamers for carrying ore from their iron deposits at Wabana, Nfld., to Sydney.

The Gurney Foundry Co. has been granted a permit to erect a three-storey warehouse to cost $36,000 on Adelaide Street close to their Toronto works.

The Canada Furnace and Iron Co. burned out a week ago at Three Rivers, are anxious to locate at Farnham, Que. From 300 to 500 men would be employed.

The warerooms of the R. Watt Machine Works, at Ridgetown, Ont., were destroyed by fire on Dec. 10., at a loss of about $50,000. The machine shops were also damaged.

The Dominion Nail & Tack Co., Galt, have moved into their new factory. Wire nails and drawn market wire will likely be made by the company in the near future.

Mr. Moorehead, U.S. Consul at St. John, is making inquiries at that city for a Wisconsin saw-making concern, which proposes locating a branch factory in Canada.

The Goold, Shapley & Muir Co., Brantford, has decided to erect a large new machine shop on Wellington Street, will enlarge the capacity of the plant for traction engines.

The Union Iron Works Co. is a new concern which proposes to locate at Parry Sound. John Youngson of the Huntsville Engine Works Co., is interested in the new concern.

The Doty Engine Works, Goderich, started its private electric light plant for the first time recently. There are at present about seventy-five incandescent lamps on the system.

McFarlane & Douglas have purchased the property in the rear of their present sheet metal factory, at Ottawa, and plans are in preparation for an extension to the building.

Hudson, Howell, Ormond & Marlett, of Winnipeg, have applied to Regina for a building site on behalf of a client who proposes to erect a large foundry to employ 700 men.

The Canadian Iron Corporation and Mackenzie & Mann intend spending during the coming year $120,000 on the Big Pier at Port Wade, N.S., for the loading and export of iron ore.

The Ontario Brass Rolling Mills, New Toronto, are again in operation, the plant having been thoroughly overhauled by the new proprietors. Brass rods and sheets will be produced.

The Vulcan Iron Works, Vancouver, have let the contract for the erection of their new plant on the city water lots to W. R. Gilley. It is the intention of the firm to increase their staff.

A by-law to partially exemp from taxation the property of the Burrell Rock Drill Co., manufacturers of rock drills and other mining machinery, will be voted on by Thurlow, Ont., ratepayers on Jan. 4.

The railway Board has dismissed the application of the Grand Trunk Railway for an order, authorizing a connection between the tracks of the G.T.P. and of the Canada Iron & Foundry Co., at Fort William.

T. McAvity & Sons, who have been in the foundry business in St. John, N.B., for a century, associated with the McLean, Holt Co., manufacturers, of the same city, intend to establish a foundry in Fort William.

The sheet steel works at Morrisburg have resumed operations, having been partially shut down owing to making repairs at the power house. Two new rolls have been installed as well as two new furnaces.

D. D. Mann states that the C.N.R. will erect repair shops and a roundhouse in Toronto next summer. Should they be given the right of entry, Ashbridge's marsh will probably be the site on which they will be built.

The Widespread Implement Co., Buffalo, has been negotiating with the municipality of Port Dover, regarding the establishment of extensive works there, consisting of a planing mill, foundry and machine shop.

A report is current that debentures are being floated to the extent of $2,000,000 in England for extensive shipbuilding yards and a floating dock at Esquimalt. The B. C. Marine Railway Co. is said to be interested in the venture.

A communication received from Mr. Tennant, financial man for the syndicate which proposes to establish large wire nail and rolling mill plants at Fort William, indicates that the plants are to be established in the immediate future.

McDonald Bros., of Grand Forks, the successful tenderers for supplying the steel piping to be used in conveying the water from Coquitlam Lake to New Westminster, have commenced work on their new factory at the latter place.

J. H. Glover, manager of the Aylmer Pump & Scale Co., was in Toronto recently purchasing a lot of new machinery for the manufacture of scales, which will be placed in the old pork factory building recently purchased.

The Thomas Davidson Co., Montreal, have purchased a block of property adjacent to the works and will extend their plant. The land is at present occupied by dwelling houses, and the price paid was in the neighborhood of $15,000.

The Ontario Iron & Steel Co., Welland, have let a contract to the Hamilton Bridge Co., to build an extension 170 by 50 feet; also a wing which must be completed by Feb. 1. The company will increase its present pay roll 25 per cent.

Barnett & McQueen will build a large machine shop and warehouse next spring at Fort William. The machine shop will be of reinforced concrete, 50 feet by 135 feet, and two storeys in height. Work on a temporary structure will be started at once.

The Canadian Northern is said to be behind the large purchase of property on the south bank of the Fraser, and a semi-official intimation has been made that immense car shops will be established on the 200 acres held by a subsidiary company.

T. F. Black, Winnipeg, is in Vancouver looking for a site for a wire factory. He may find a location on the Fraser river. Should the proposition go through, it will be financed by a company composed principally of British Columbia men.

George A. Clare, M.P., head of the firm of Clare Bros., stove manufacturers, Preston, Ont., was in Winnipeg lately, and acting in conjunction with his local agents, Clare & Brockest, they secured a site for a large warehouse to be erected shortly.

Four firemen were injured at a fire which broke out at the works of the Canadian Iron & Foundry Co., on Dec. 23. The building was badly damaged, and the loss will be about $40,000 to the Canadian Iron & Foundry Co., which is covered by insurance.

The Berry, Transformer Co., of Helspy, England, one of the largest concerns of the kind in England, is lookingf or a location in Canada, perhaps in London. This firm will employ 500 men. Sherbrooke, Toronto, Hamilton, Galt and other cities are after this concern.

At a recent meeting of the Medicine Hat Water Commissioners it was decided to equip a machine shop at the power house with a lathe, drill, 7 h.p. gas engine and small tools. It was further decided to accept the offer of the A. R. Williams Machinery Co., Winnipeg, for above.

At a cost of $1,000,000, the Montreal Street Ry. Co. is about to commence the erection of

a plant, consisting of car building shops, machine shops, electrical and winding shops, blacksmith and paint shops, and a large building for the stores and material of the company.

The Jordan-Wells Railway Supply Co. proposes to establish a plant either in North Vancouver or New Westminster, with an expenditure of $50,000, the plant to employ 30 skilled men. Sites are now being looked over. A proposition has been made to the North Vancouver council.

The Morrisburg Tack & Mfg. Co. is now a fully organized concern, with Wm. Eager, president; Irwin Hilliard, secretary, George N. Hickey, treasurer, and C. B. Russell, manager. These officers were chosen at a meeting held last month. The company is capitalized at $40,000.

The Hayes Mfg. Co., of Erie, Pa., has secured an option on a large piece of land at Montreal on which they will construct a Canadian branch for the manufacture of waterworks supplies, thus escaping the 35 per cent. duty. A $50,000 plant is to be erected on this land next year.

The Western Drydock & Shipbuilding Co. have filed plans and specifications of the proposed buildings to be erected on their site at Bare Point, Port Arthur. The buildings include a warehouse, blacksmith shop, foundry, pattern shop and storage, office, power house, machine shop, boiler shop and joiner shop.

The Cockshutt Plow Co. is commencing extensions on their plant at Brantford, which, it is said, may result in an outlay of $100,000, next spring. It is also stated Frost & Wood concern may go to Brantford, owing to recent selling arrangements entered into with the firm by the Cockshutt Co., which may result in a merger.

The Bedford Stove Co. are making extensive improvements to their buildings and manufacturing works at Bedford, Que. They have moved their offices and store rooms into their recently acquired property across the street, which have been fitted up for the purpose, and are remodelling the former offices into a tinshop and show rooms.

It was rumored at London that the Canadian British Insulating Co., of Montreal, would establish a plant there. The company asks for free site, free taxes and free water, for a period of 15 years. In return, they would employ 500 men and use 500 horsepower. They have a capitalization of $5,000,000, and are looking for a suitable site in Ontario.

R. E. Cushman, representing the Canadian Lead Mining and Smelting Co., has asked the Kingston city council for the lowest cash price the city will make for a smelter site. If the price is satisfactory: and exemption from taxes for ten years is given, the company will guarantee to erect on the site, a smelter, and have it in operation in eighteen months after the property is purchased.

The construction work of the new steel casting plant at the Londonderry, N.S., Iron Works is nearing completion. The open hearth furnace is practically completed, also the coke ovens. After the instalation of a sand-mixer, a traveling crane, a metal saw, and some other machinery, the work of casting will commence. The plant will use oil in place of coal for fuel.

W. E. Redway, Toronto, submitted a proposition looking to the establishment of a shipbuilding industry at Belleville. He wants a free site, $10,000 worth of dredging done by the city, a loan of $25,000 without interest, to be repaid at the rate of $1,000 a year, and exemption from taxes other than school taxes. In return he proposes to build a plant valued at $30,000.

The Canadian Bond Hanger & Coupling Co., a Canadian branch of the Bond Co., operating in Manheim, Pa., and capitalized at $75,000, will start operations in February at Alexandria. The directors are: President, Charles Bond, Philadelphia; vice-president, John McIntosh, Alexandria; directors, Hugh Munro, Alexandria; Martin G. Hess, and M. T. Williams, of Manheim, Pa.

Dr. Becktel, of Cleveland, representing manufacturers in the wire business in that city, says the Standard Chain Works, of Sarnia, the Canadian branch of the American Standard Chain Co., is to be bought by the company which he represents. The present building is to be immediately enlarged, and a staff of forty or fifty first-class chainmakers will be employed from the outset.

The Waterous Engine Works Co., Brantford., has purchased the Seagrave Fire Apparatus Works at Walkerville, and will remove them to Brantford, where they will be merged with the Waterous works, which will be extended. The company has already secured additional space, including the plant of the Waterous Wire Nail Works which will locate elsewhere. About fifty additional hands will be employed.

At the annual meeting of the Silliker Car Co., held at Halifax recently the financial statement showed a net profit of $4,000 on the year's operations, which, with a balance of $14,000 from last year, made approximately $18,000 of net profits carried forward. The report of the directors recommended the increasing of the capital stock from $500,000 to $750,000. This it proposed to do by authorizing the issue of $250,000 in 5 per cent. cumulative preferred stock. Of this amount it is proposed at this time to issue $125,000.

Arrangements have just been completed at London, Eng., for the erection of a dry dock at Levis. The interests involved are the Canadian Pacific, the Allans, Harland and Wolff, Sir Charles MacLaren, representing the John Burn Co., of Sheffield; Mr. Davie, of Levis, who conducted the present salvage and dry dock business there, and the McArthur Perks Co., of Canada. The same interests have made a definite proposal to the Canadian government which they expect will be accepted for a dry dock at St. John.

The Canadian branch of the Crocker-Wheeler Mfg. Co., of Ampere, N.J., will be located at St. Catharines. The firm has one contract on hand now for the City of Winnipeg in connection with the big power works. This contract alone amounts to $250,000. The machinery will be made in St. Catharines, and it will be necessary to greatly enlarge the factory building the company have purchased from the city. While they agree to start with a hundred first-class mechanics, the company say that within a few years they will be employing perhaps a thousand.

The Newfoundland Smelting Co., with a capital of $100,000, has just been registered at St. John's. The intention of the company is to erect a smelter at York Harbor, Bay of Islands, with a capacity of about one hundred tons a day. The company will get their supply of ore from the York Harbor property, having already one year's supply ahead of them. They also hope to get a quantity of ore from outside concerns, and anticipate that with it will give a boom to the copper mining industries in Newfoundland. The company will export the copper to Swansea and New York.

At a meeting of the directors of the Nova Scotia Steel & Coal Co. held in Montreal, recently, it was decided that as the profit and loss account on Dec. 31, 1908, showed a balance of $1,219,221 of accumulated profits, a stock bonus or dividend of 20 p.c. to common shareholders be recommended. Each shareholder will receive one share of common stock for every five shares now held by him. It was also resolved to pay a cash dividend of 1 per cent. on the common stock of the company. It was stated that business for 1909 has been fairly good, and notwithstanding the depression which has existed, the profits will exceed those of last year by at least $100,000.

Work is rapidly progressing on the new sewerpipe plant of the Alberta Clay Products Co., Medicine Hat, Canada. All concrete work in connection with the dry-press, brick-machinery room is completed and the machinery for making brick has been set. The plant will be placed in operation as soon as possible so that the remainder of the brick construction work can be done with brick made on the job. As planned, the buildings to be constructed will be as follows: boiler room, 48 x 48 ft.; engine room, 30 x 48 ft.; clay storage house, 140 x 45 ft.; machine room, 50 x 60 ft., and dry-press room 40 x 40 ft. The main building will be four stories high and will measure 80 x 256 ft. in dimensions. The power plant will develop 450 h.p. The drier will use the steam exhaust from the engines during the day and labor steam at night.

Chatham's, Ont., new stove company was formally organized last month. The concern will be known as the Modern Malleable Range Co., and is capitalized at $40,000. The officers are: President, W. R. Landon, Chatham; vice-president and general manager, Fred Reissner, Leamington; secretary-treasurer, R. Ross, Leamington; factory the Reissner Bros.' stove works at Leamington; directors, Robert Gray, Manson Campbell and John G. Kerr, Chatham. The company takes over the business of the Reissner Bros., stove works at Leamington, having bought that concern's machinery, and will manufacture the "Modern" steel range hitherto manufactured by the Reissner concern. The factory will be situated on St. George Street, immediately opposite the Gananoque Spring & Axle Co.'s plant. The management will remain largely in the hands of Louis and Fred Reissner. They hope to be turning out stoves from the Chatham factory in the course of a couple of months.

Structural Steel.

Three bridges are to be built at Melfort, Sask., by the Government.

Plans have been outlined for a bridge across the Elbow River at Calgary.

The Hull council awarded the contracts for the bridge over Brewery Creek to the Trust Concrete & Steel Co. at $1,115.

Saskatoon citizens have voted to issue $18,000 of bonds for the erection of a footbridge on Twentieth Street.

The B.C. Provincial Government is about to construct a suspension bridge at Chilliwack to replace the one washed away.

The contract for the ornamental iron work on the Chateau Laurier, Ottawa, has been awarded to the Canada Foundry Co.

Sherbrooke ratepayers are petitioning the city council for a new bridge across the St. Francis River to replace the old Aylmer bridge.

The contract for the structural steel in connection with the addition to the Montreal Arena skating rink has been awarded to the Dominion Bridge Co.

The Canadian Bridge Co., Walkerville, has been awarded the contract for the superstructure of the Cambie Street bridge at Vancouver at $439,210.

H. C. Stone, Montreal, has awarded the contract for the steel work on the extension of the Beardmore building to the Dominion Bridge Co., of Lachine.

The contract for the extension to stores at 1133 St. Catherine street west, for the David Ouimet Estate, have been awarded. The steel work goes to the Phoenix Bridge Co.

The Montreal City Council will ask the C.P.R. Co. to construct a bridge from Lacroix to Montcalm streets, in order to maintain the traffic on Notre Dame street.

Work has begun on the pile driving in preparation for an iron bridge to be placed over the Dudgeon Creek, on the Salisbury and Albert Railway at Hopewell Hill, N.B. The bridge is to be a 50-foot span.

The tender from the Jenks-Dresser Co., of Sarnia, for $1,000, for the supply, erection and completion of steel floor beams and posts for the new engine room at the main pumping station at Toronto was accepted.

It is understood that the C.P.R. has made Guelph a most important proposition to protect the Eramosa road and Heffernan street crossings by the erection of overhead bridges if the city will undertake the responsibility of protecting Allan's crossing.

The Ontario Railway and Municipal Board ordered the City of Guelph and the Guelph Radial Railway Co. to forthwith construct a new four-span steel bridge over the Speed River on the Dundas road, in accordance with the report of F. L. Somerville, C.E.

F. H. Barnes, C.E., has made an examination of the proposed bridge sites at Victoria for the Trinity Valley road, finding the suggested locations suitable and estimating the cost of the bridge at $5,000. It is believed that the bridge will be built by the Government this season.

The Western Iron Works Co. are completing the ornamental work on the new Canada Permanent building at Winnipeg, and have commenced the erection of elaborate ornamental work on the new McArthur building. They are also filling many important contracts in Calgary and Edmonton.

Tenders for the substructure of the new Quebec bridge, of which the estimated cost is to be $10,000,000, and which is to be completed in four years, were delivered to the Department of Railways and Canals in Ottawa, November 30. The weight of the superstructure to be carried will be 130,000,000 lbs., whereas the weight of the superstructure of the bridge that collapsed was to be but 70,000,000 lbs. The cost of the steel in the new bridge is to be about $7,500,000. Nickel-steel is to be largely used. It is expected that tenders for the steel work will be called for about May 1.

Planing Mill News.

The Bruce Mines Sawmills Co. have just completed a new plant.

Russell & Son are erecting a heavy portable sawmill at Thornloe, Ont.

Hewson-Campbell & Dail have started a shingle mill at Aldergrove, B.C.

A permit has been granted Elliott & Son, for a furniture factory at Toronto.

Keenan Brothers, Owen Sound, are building a sawmill at Miller Lake, Ont.

The Golden Lake Lumber Co., Eganville, Ont., are making additions to their mill.

A new planing mill and sash and door factory is to be erected shortly at Vancouver.

A. and F. Fraser are about to construct a sawmill at the head of Hazley's Bay, near Pembroke.

An up-to-date shingle mill is being added to the Harriston Lake, B.C., plant of the Rat Portage Lumber Co.

The Globe Furniture Co., of Walkerville, Ont., have sold their plant and are planning to continue elsewhere.

The Brooks-Scanlon Lumber Co. are planning to erect a large sawmill on the Fraser River at New Westminster.

The Saginaw Salt & Lumber Co. are to expend about $15,000 in improvements on their sawmill at Thessalon.

Hugh Baird & Son, Markdale, Ont., intend to erect a sawmill at Thornbury, with a capacity of 50,000 feet daily.

U.S. capitalists have about completed arrangements for the erection of a large basket and box works at New Westminster, B.C.

Donald Fraser & Sons will erect another mill at Fredericton, to take the place of the Aberdeen mill which was destroyed some years ago by fire.

The Canadian Pacific Lumber Co.'s saw and shingle mill at Port Moody, B.C., which has been closed down for some months, will resume cutting early in January.

The Hunting Lumber Co. whose sawmill was recently destroyed by fire, will build a new mill on a site recently secured on Burrard Inlet, between Barnet and Port Moody, B.C.

Mount Forest ratepayers will, on January 3, vote on a by-law to aid the enlargement of Leslie Brothers' planing mill and factory, in that town, by granting them free water for the use of the factory, and a limited assessment and taxes.

Negotiations have been in progress for some time with Senator Thompson for securing the Estey mill site near Fredericton, for the erection of the new mill which a company that is being organized intend to erect there next spring.

The Royal City Shingle Mills, New Westminster, B.C., have been temporarily closed down while the machinery is receiving its annual overhauling. New boilers and smokestacks are being installed.

The dry kiln and heading mill at the Wallaceburg Cooperage Co.'s plant, Wallaceburg, Ont., have been destroyed by fire. The adjoining mills were saved through the efforts of the fire department. The heading mill is a complete loss, but will be rebuilt.

Irwin & Sons, of Hornings Mills, have purchased the building formerly occupied by S. Hill as a sash and door factory at Markdale, and will fit up the building with modern machinery for the manufacture of skewers, fork handles, etc. They will employ 20 hands or upwards.

The Canada Woodenware Co., whose plant at Ossekeag, N.B., was burned in June, 1907, is being reorganized, and sufficient capital is being secured to build an up-to-date plant at South Bay, N.B. George C. Weldon, president of the S. Hayward Co., is president of the company, and William Brown, of Hampton, will be in charge of the business.

Statistics of the lumber industry in British Columbia show that the total number of sawmills is 204; capacity, approximate average, 8,080,000 feet a day; shingle mills, 45, with a capacity of 2,250,000 yearly, logging camps, 265; donkey engines and logging locomotives, 267; horses employed, 1,500; men employed, 17,000; number of mills closed, 17.

John Bell, of A. G. Lambert & Co., Nelson, B.C., and Thomas B. White, of Johnson, White & Co., manufacturers of hardwood lumber, staves and hoops, Kolapore, Ont., have acquired from the Boundary Development & Exploration Co., of Greenwood, B.C., a ten-acre mill site near Midway, in the Boundary district, and will erect a good-sized sawmill before spring.

The North Pacific Lumber Co., of Barnet, B.C., who were burned out recently, are rebuilding their plant and are expected to use electric drive. They have placed their order with the Vancouver office of the Allis-Chalmers-Bullock, Limited, for one 600 k.w., 3-phase, 60-cycle, 2,200-volt standard engine type alternating current generator, one engine type direct current exciter generator, and a three-panel switchboard for the control of generator, exciter and power circuits.

Upon the re-opening of traffic in the North Arm, which is now blocked by the construction of the new bridge, the Westminster shingle mill on Lulu Island, B.C., will commence operations. The mill will have a daily capacity of 150,000 shingles. Six shingle machines are included in the plant. It is the intention of the company to erect a large lumber mill shortly, to which the shingle mill will be an auxiliary. Construction will probably be started in the spring.

The B.C. Gazette gives notice of the incorporation of the following companies: Christie & Co., capital $40,000, incorporated to construct, build and operate sawmills, shingle mills, sash, door and box factories and operate the same; J. A. Dewar Co., capital $250,000, incorporated to carry on the business of timber merchants, sawmill proprietors, shingle mill proprietors, lumbermen, manufacturers of woodenware in all or any of its branches, pulp or paper manufacturers, etc.; Sechelt Logging Co., capital $5,000.

Another large deal in Newfoundland lumber has been closed by American capitalists. Canadians are also interested. The National Vulcanization Corporation, of the United States, and the Lumber Securities Corporation, are associated with the purchasing interests, and pulp and saw mills and vulcanizing plants will be put into operation as soon as possible. Some of the principals of these companies were in Toronto recently to consider the establishing of Canadian plants controlled by a Canadian company, which is now in process of formation. The Newfoundland operations would have in view only the market of the Atlantic seaboard. Other plants may be erected in Ontario and British Columbia. The Newfoundland undertaking is capitalized at $5,000,000, and the Canadian company, with head offices in Toronto, at $1,000,000.

General Manufacturing News. . .

The Manitoba Pump & Windmill Co., Brandon, is extending its premises.

The J. B. Snowball Co. will erect a grist mill at Chatham, Ont., next fall.

The construction of the Welland glass works will be commenced next spring.

The Tudhope Carriage Co.'s works at Orillia started operations last month.

The San Francisco Stone Co., is considering a proposition of starting a plant at Calgary.

The manufacturers of the Chamberlain weather strip propose locating a branch factory at St. John.

J. Scott, of Port Huron, Mich., proposes establishing a refrigerator manufacturing plant at Camrose, Alta.

Joseph Little, of Blairmore, B.C., contemplates establishing one of the largest lime burning industries in Canada, at Frank, Alta.

The pulp works at Swanson Bay (Prince Rupert) of the Canadian Pacific Sulphite Pulp Co., are now working to their fullest capacity.

A Vancouver syndicate, Auld, Gwynn & McLarty, representing the Northern Oil Co., are looking for a site for an oil refinery near Esquimalt.

Ald. Martin, Cobalt, will erect a $50,000 hotel before next spring, the building to be six storeys in height, of fireproof construction throughout.

Prescott ratepayers will on January 3 vote on the question of granting aid to the Ogdensburg Soda Pulp Co. to establish a branch factory there.

The Collins Mfg. Co., Toronto, have moved into their new factory on Symington Avenue, adjoining the C.P.R. tracks, in the northwestern part of the city.

Mr. Sterett, of the Independent Asphalt Co., Seattle, is looking into the possibilities for locating a branch plant at Vancouver, to cost in the neighborhood of $40,000.

M. Townsley & Son, Minneapolis, manufacturers of cable lightning arrestors, are looking over the ground at Brandon with a view to finding a location for a branch.

The Winnipeg Oil Co. have made application for a site at Moose Jaw, where they will erect a plant, with storage, cooperage, barreling and also a tank, capacity, 12,000 gallons.

The new plant of the Sydney Slag Brick Co., at Sydney, C.B., which has been under construction the past several months, is now completed and the manufacture of brick has been commenced.

The Brandon Shoe Co., whose factory was destroyed at Aylmer by a boiler explosion, will go to Brantford, backed by local capital. A site has been secured and a new factory will be erected as soon as possible.

The D'Israeli Asbestos Co., Que., have placed a contract for locomotives and cars in New York, necessary for their railroad. The equipment is expected in February, when everything will be ready for starting operations.

The People's Ice Co., financed by well-known business men of Toronto, with the assistance of practical ice manufacturers, have decided to erect a plant at that place to produce "Absopure" ice, under rigid sanitary conditions.

A creosoting plant will be erected on Burrard Inlet, B.C., at a cost of several hundred thousand dollars. In association with several Vancouver capitalists, H. R. Rood, head of

the Pacific Creosoting Co., of Seattle, will be in charge of the undertaking.

Among the British concerns which intend to locate branches in Canada are Doulton & Co., makers of the famous Doulton ware; Maw & Co., one of the largest makers of fancy tiles, and Hope & Co., of Birmingham, manufacturers of locks and ornamental iron work.

The new fuel testing plant of the Department of Mines at Ottawa has been completed, and it only remains to instal the machinery. The first use which will be made of the building will be to demonstrate that peat is an ideal fuel for the production of power gas. Already 70 tons of peat have been delivered at the building.

Two new industries will commence operations in Berlin during the next few weeks. The Berlin Fuel Savers Co. have leased part of the old market building and will make the new fuel saver and heat generator, which has been patented; and Wm. J. and Fred. Witte have returned from Newark, N.J., and have leased a flat, where they will manufacture high-grade buttons.

The West Canadian Co., which operates coal mines at Lille and Bellevue, and is opening a new mine at Blairmore, has under way the construction of an entire new operating plant at its Bellevue collieries, which, when completed, will constitute probably the finest mining equipment yet installed in The Pass. The plant will include the most modern appliances for the expeditious and economical handling of coal, and when ready for operations will enable the company to put on the cars 2,000 tons of coal on an eight-hour shift. The improvements complete will entail an expenditure of approximately $250,000.

Port Arthur's industrial committee has closed an agreement with the Canadian Linen & Paper Co., represented by E. P. Bender, Winnipeg; Dr. Phar, Winnipeg; H. F. Forest, Winnipeg, and Prof. Meygret, France, to locate a manufactory there for the making of linen and paper from flax. The company gets 50 acres site free, but no bonus, except tax elimination. It will start May 1, 1910, on the erection of a $50,000 plant, and will spend $250,000 in five years and employ at least 150 men. The company will use an entirely new and secret process, making linen at a greatly reduced cost. One of the principal reasons in coming here is to get water and air free from alkali.

Trade Notes.

The Canadian Inspection Co., have removed their Toronto offices from 37 Melinda St., to Stair Bldg., cor. of Adelaide and Bay Streets.

Smith, Kerry & Chace, consulting engineers, Toronto, have opened up an office in the Winch Bldg., Vancouver, which will be the head office for Western Canada.

J. L. Goodhue & Co., Danville, P.Q., makers of the brands "Extra," "Standard" and "Acme Waterproof" of leather belting, have been incorporated under the name J. L. Goodhue & Co., Limited, with capital of $190,000. There will be no change in the management.

G. E. Mason, representing the Lancashire Dynamo & Motor Co., has opened up offices at 152-4 Bay St., Toronto and will manage the Canadian business of this company. They specialize in motors and dynamos; motors being constructed for machine tools, foundries, etc.

The Soledad Mining & Milling Co., Mexico, have installed complete mills for amalgamation and cyanidation, the machinery consisting of four Nissen Stamps, machinery complete for regrinding, steam power plant, electrical equipment, the complete order being placed with Fairbanks-Morse & Co.

The Standard Engineering Co., 47 Wellington St., Toronto, have installed in the works of the Montreal Mills Co., 1—No. 6, type R stoker horseshoe furnace; 1—No. 6, type R stoker bolt furnace; 1—No. 6, type R stoker nut furnace, making the fifth order from this work. In addition the Standard Engineering Co. have made a number of large instalations of stoker fired steel heating furnaces in the United States.

The Mumford Molding Mch. Co., has been organized and will sell the foundry molding machines heretofore sold by the E. H. Mumford Co., Philadelphia. The machines will be manufactured by the Q.M.S. Co., at Plainfield, N.J., and the Mumford Molding Mch. Co., will have its sales office at 30 Church St., N.Y. W. D. Sargent is president, and E. H. Mumford, is vice-president and general manager of the new company.

The Canadian Fairbanks Co., announce that they have been appointed the exclusive sales agents for Canada for Dicks' Balata Belting and have purchased the business of J. S. Young. All orders in the future should be sent direct to their nearest branch house. Large stocks are carried at the present time at Montreal and Vancouver, and stocks are on the way to the branches at St. John, N.B., Toronto and Winnipeg.

New Companies.

Jones Hardware Co., Uxbridge; share capital $11,000.

Cassiar Coal Co., Toronto; capital, $2,000,000; to develop coal and mineral properties. Incorporators, A. Dods, R. McKay and G. Grant, Toronto.

Colonial Transportation Co., Ltd., Toronto; share capital, $100,000; provisional directors, A. M. Boyd, M. P. Arnold, M. McPhee, R. B. Henderson, and W. W. Sloan.

Canada Pipe and Steel Co., Toronto; share capital, $100,000; provisional directors, J. L. Ross, A. W. Holmsted, O. R. Bickerstaff, W. L. Carr, and E. M. Carruthers.

The Universal Electric Economy Co., Montreal; capital, $20,000; to manufacture electrical appliances. Incorporators, E. F. Surveyer, G. V. Cousins and C. A. Hale, Montreal.

The Thetford Asbestos Syndicate, Montreal; capital, $100,000; to develop asbestos properties in Quebec province. Incorporators, G. V. Cousins, C. A. Hale and P. F. Brown, Montreal.

The F. and L. Co., Toronto, capital, $75,000; to manufacture and deal in products of iron and wood. Incopotators, Jas. Fowler, Toronto, and Jas. Wilson and W. B. Campbell, Detroit.

The Electro-Steel Co., of Canada, Toronto; capital, $100,000; to treat, smelt and refine mineral ores by electric process. Incorporators, J. S. Lovell, W. Bain and R. Gowans, Toronto.

The Stratford Carriage & Motor Co., Stratford; capital, $100,000; to manufacture carriages and automobiles. Incorporators, M. L. Evely, F. J. Walker, and Alex. Faill, Stratford.

Morrisburg Tack Mfg. Co., Morrisburg; capital $40,000, to manufacture and deal in tacks, brads and small nails. Incorporators, Wm. Eager, G. N. Hickey and Andrew Broder, Morrisburg.

The Automatic Gas Co., Montreal; capital, $100,000; to manufacture and deal in gas engines, etc. Incorporators, W. Farwell, Sherbrooke; and F. Paul and W. G. McConnell, Montreal.

The Shawinigan Cotton Co., Montreal; capital, $1,000,000; to construct and operate cotton and woollen factories. Incorporators, A. C. Calder, T. E. Gadbois, and Oscar Gagnon, all of Montreal.

Canadian Bond Hanger and Coupling Co., Ottawa; capital, $45,000; to carry on business of founders, machinists, millwrights, etc. Incorporators, W. C. Perkins, M. C. Edey, and A. W. Fraser, Ottawa.

Calgary Power Co., Montreal; capital, $3,000,000; to build and operate an electric light, heat and power company throughout Canada. Incorporators, E. F. Surveyer, G. V. Cousins and C. A. Hale, Montreal.

Lethbridge Collieries, Ltd., Montreal; capital, $3,000,000; to take over the Lethbridge Collieries Co., and operate coal, oil and mineral properties. Incorporators, E. F. Surveyer, G. V. Cousins and C. A. Hale, Montreal.

The British Columbia Gazette contains notice of the incorporation of W. J. Pendray Co., with a capital of $500,000 to take over the business carried on by W. J. Pendray under the trade name of the B.C. Soap Works and the British American Paint Co.

McKinnon, Holmes & Co.

McKinnon, Holmes & Co. have formed a limited company under the above title with J. W. Bowman, President; G. D. McKinnon, B.A.Sc., Vice-President and General Manager; and A. R. Holmes, C.E., Secretary and Treasurer. Their offices and works are located at Sherbrooke, their specialty being steel plate and structural work, including construction of bridges, water tanks, water wheels, boilers, elevators, etc. Steel shapes will be carried in stock for immediate shipment.

An Industrious City.

"Turn Wellandward," is one of the neatest recent booklets issued by any industrial centre. In Welland, at least a dozen branches of United States industries have been established during the three past years. Its population has increased over 300 per cent. in the past five years. Among the industries illustrated are M. Beatty & Sons, Ontario Iron & Steel Co.; Robertson Machinery Co.; Canada Forge Co.; Canadian Billings & Spencer; Plymouth Cordage Co.; Supreme Heating Co., etc. Welland is in the electric zone and is one of Canada's growing cities. The interesting booklet, full of information, is issued by J. D. Payne, Secretary Board of Trade, and B. J. McCormick, Industrial Commissioner, Welland.

New Wire and Nail Plant.

Negotiations are in progress for the erection of a wire and nail plant at Fort William. Prominent Montreal capitalists, including H. S. Holt, president of the Montreal Light, Heat & Power Co., and F. W. Thompson, second vice-president and managing director of the Ogilvie Milling Co., are interested. Interviewed on the project, Mr. Holt said that they were progressing as rapidly as possible, but it was impossible to say how soon they would commence the erection of the plant. Mr. Holt further said, "The advantages of a plant at Fort William are threefold. There is cheap fuel, and cheap raw material, for the Soo Corporation will soon erect a steel rod mill at their plant, which will give us raw material practically at our doors. We will also have cheap water power. No definite plans have yet been drawn up, but we are progressing as fast as possible with negotiations."

New Coke Ovens at Soo.

The Lake Superior Corporation has placed a contract for the instalation of a system of by-product coke ovens, at the Soo plant. The apparatus will consist of a series of 110 ovens, arranged in two batteries, each of 55 ovens. The type of oven will be the same as is being erected at Gary, Ind. The cost of the plant will be about $1,500,000. The charge of coal for each oven will be about 13 tons, making a total charge for the 110 ovens of over 1,400 tons of coal. The yield of coke per oven will be about 10¼ tons, or nearly 1,200 tons per day. For the generation of industrial power nearly 10,000,000 cubic feet of surplus gas will be available. Indicated by heat units, the quality of this gas represents a heat value of about 200 tons of good coking coal. The distinguishing feature of this system is the extraction of ammonia direct from the gas in the form of sulphate of ammonia, without the employment of a

water scrubbing process. An improvement in the coke quenching arrangement will also be instituted, so that instead of having a coke bench the coke will be pushed into a coke quenching car. It is expected that the plant will be in operation by January, 1911.

Tallman Brass & Metal Co.

Tallman Brass & Metal Co., which occupied quarters on Wellington street north for 13 years, have opened up their large new factory and foundry on Wilson street, east of Sanford avenue, Hamilton, and are quickly getting down to hard work to execute the many orders they have on hand for the winter trade. Tallman Brass & Metal Co. manufacture Arctic metal, and in their new establishment have more than doubled every branch of their business. The Arctic metal department has been increased to four times its previous capacity. The metals used by this enterprising firm are imported direct, and the company does a fine jobbing business in tin, lead, copper and aluminum ingots and antimony. Brass castings are a specialty and the instalment of new and up-to-date machinery and equipment enables the company to turn out orders in quick time in the best of style.

The very latest machinery, including an ore crusher, which effects a great saving in metal, has been installed, and the brass furnaces are of the latest pattern. All gases and fumes are carried outside of the building by special blowers.

Type metals, all grades of solder and ingot metals are manufactured in the new plant. A fireproof pattern storage vault has been built and the whole place is practically fireproof and equipped with fire and burglar alarms.

Another Canadian Industry.

The Northern Aluminum Co., which recently established offices in the Traders Bank building, Toronto, and which has secured large orders for aluminum wire for the Hydro-Electric power system, intends to inaugurate an active campaign to introduce their cooking utensils to the retail hardware trade in Canada. For the present the stock will be imported but a site has, it is understood, been selected for a Canadian factory at either Niagara Falls or Brockville, near their existing plants at Niagara Falls and Massena, New York. The company already has furnaces and a wire plant at Shawinigan Falls, Quebec. The Northern Aluminum Co. has already introduced its kitchenware in Toronto, and other cities.

The Northern Aluminum Co. is a branch of the Aluminum Company of America, whose headquarters are at Pittsburg, and which recently declared a stock dividend of 500 per cent. and gave notice that it would increase its capital from $3,200.000 to $25,000,000. The company is now paying the equivalent of 24 per cent. per annum on its common stock, which sold some months ago as high as $350 per share and in 1907 at $500 per share. The declaration of a stock dividend has been expected for the last three years, but was delayed by the 1907 panic and is part of the general plans of the company to enlarge the scope of its operations. The stock dividend entails the issuance of $16,000,000 additional stock, bringing the outstanding common up to $19.200.000. In 1904 the company had but $1,600,000 common outstanding, but declared a 100 per cent. stock dividend in that year.

The company, through one of its subsidiaries, recently applied to the Canadian Government for the privilege of damming the St Lawrence River below Brockville, so as to create 80,000 horse-power to be used at Massena, where the company has a $5,000,000 investment.

In spite of the expiration in February last of the patents under which aluminum has been made in the United States, the Aluminum Company has not as yet met with any new competition.

The present capacity of the Aluminum Company is understood to be about 20,000,000 lbs. per annum, which is nearly 40 per cent. of the world's total production of aluminum. Last year, however, the company did not output more than 8,000,000 lbs., and at the present time is not operating more than half its capacity. Through reductions in price the company expects to popularize the use of aluminum and greatly increase its output.

CATALOGUES.

DROP FORGE OPEN TURNBUCKLES—Price list with sizes of turnbuckles from Canadian Billings & Spencer, Welland.

UNDERWRITER STEAM PUMPS—Bulletin 35 from Canada Foundry Co., Toronto, describes the Underwriter Steam Pumps from 500 to 1,500 gal. per min. capacity.

BRIDGES & STRUCTURAL STEEL—Circular from the Hamilton Bridge Works showing a bird's-eye-view of their works, including the new buildings recently constructed.

HYATT STANDARD BUSHINGS—Bulletin 300M describing the high duty type of Hyatt standard bushings, has been issued by the Hyatt Roller Bearing Co., Newark, N. J.

BEAM AND COLUMN DATA—This book of data is sent with the compliments of Ernest McCullough, C.E., chief engineer Northwestern Expanded Metal Co., 930 Old Colony Bldg., Chicago, Ill.

PUNCHING AND SHEARING MACHINES—Catalogue on bond paper, describes punches and shearing machines, universal boilermakers' tools, rolls, etc., manufactured by the Covington Machine Co., Covington, Va.

HORIZONTAL MILLING MACHINES—A folder from the Fosdick Machine Tool Co., Cincinnati, Ohio, gives the features of No. and 2 Horizontal Boring, Drilling and Milling Machines recently described in Canadian Machinery.

FIRE CLAY, BRICKS—James Dougall & Sons, Bonnyside Fire Clay Works, Bonnyside, Scotland, represented in Canada by S. Galbraith, 73 Dupont St., Toronto. The catalogue contains 134 illustrations of firebrick shapes, etc.

ELECTRIC FURNACES—A catalogue issued by the American Electric Furnace Co., 45 Wall St., New York, and Niagara Falls, Ont., describes and illustrates in large half tones the Kjellin, Colby and Rochling-Rodenhauser systems.

RECORDING INSTRUMENTS—Bulletin 103 issued by the Bristol Co., Waterbury, Conn., deals with recording instruments for blast furnace, plants for steam and blast pressures. Record charts are illustrated, besides a number of other recording instruments.

PORTABLE TOOLS—S. Obermayer Co., 641 Evans St., Cincinnati, Ohio, have issued a catalogue of their Peerless A.C. and D.C. electric tools. These include illustrated descriptions of chipping hammers, hand drills, breast drills, reamers, grinders, etc.

MOLDING MACHINES—Catalogue 23 from the Arcade Mfg. Co., Freeport, Ill., describes the modern molding machine. The catalogue is an interesting article on the molding machine illustrated throughout with the Arcade machine. The jolting machine is also described.

STANDARD GAUGES—Accuracy is the keynote of the catalogue describing the "Johansson" combination standard gauges manufactured by Gronkvist Drill Chuck Co., 18 Morris St., Jersey City, N.J. Different gauges are described and illustrated with their applications.

EMERY WHEELS—No. 20, from Prescott Emery Wheel Co., Prescott, Ont. The catalogue deals with emery wheels, grinders and polishers of all kinds and various attachments for grinders. Prices are given for the different machines. This is a good reference catalogue which should be kept on file.

STEEL DRILL RODS AND SPRING WIRES—W. N. Brunton & Son, steel wire manufacturers, Musselburgh, Scotland, have issued a catalogue of cast steel drill rods and silver steel rods for drills, taps, etc. Sizes, prices and directions for hardening are given. Steel wire in any size is made by this company, the many shapes being illustrated in their catalogue.

REFRIGERATION MACHINERY—Catalogue A from the Vilter Mfg. Co., Milwaukee, Wis., describes refrigeration and ice making machinery. The catalogue is well illustrated showing the progress of work through their shops and completed machinery for various systems. Systems are also given. The catalogue is full of information in regard to ice machinery.

CHUCKS—The Skinner Chuck Co., New Britain, Conn., 1909 Price List, 4 x 7¼, 48 pages. Lathe, drill and planer chucks, face plate jaws, reamer and assembling stands, and drill press vises. Each different style of chuck is illustrated by half-tone cuts. The company also makes special chucks for holding automobile gears and parts, in addition to those shown in list.

FUEL OIL AND GAS BURNING APPLIANCES—The W. S. Rockwell Co., 50 Church Street, New York City, is sending a pamphlet to the foundry trade, which illustrates a few of the latest types of Rockwell furnaces, fuel oil and gas burning appliances. A number of views of fuel oil and gas burners, as well as Rockwell fuel oil pumping system are also included.

NEW TOOLS—The L. S. Starrett Co., Athol, Mass., have issued a booklet describing the new tools for machinists and engineers recently placed on the market. These include protractors, gauges, verniers, micrometer, calipers, dividers, etc. Descriptions of a number of these appeared in recent issues of Canadian Machinery. Copies of this booklet will be sent on request.

MILLING MACHINES—Catalogue 17 from Kearney & Trecker, Milwaukee, Wis., is a handsome volume, 80 pages, 6 x 9 ins., printed on bond paper. The catalogue is very complete, showing the growth of the Kearney & Trecker milling machine. Following this is a description in detail of their millers, each part being illustrated. Instructions are given for their operation.

ANNEALING AND HARDENING FURNACES—W. S. Rockwell, Hudson Terminal Building, 50 Church St., New York, have issued a pamphlet dealing with furnaces suitable for annealing, hardening, tempering or case-hardening of tools, taps, dies, punches, machine parts, etc. The furnaces can be operated with either gas or oil as fuel. Full information as to size, gas or oil consumption, etc., is given.

TOOL HOLDERS—Armstrong Bros. Tool Co., 339 N. Francisco Ave., Chicago, have issued a new catalogue No. 18, listing, with prices, tool holders for turning, planing, boring, slotting, threading, cutting off and drilling metals. Among the new goods listed in this catalogue are automatic drill drifts, pages 68 and 69, plain drill drift, page 67 and standard reversible ratchet drills, pages 60 and 61.

GEAR CUTTING MACHINES—1909 catalogue No. 1, of machines designed and manufactured by Newark Gear Cutting Machine Co., 66 Union St., Newark. This company was formerly Eberhardt Bros. The catalogue contains illustrated descriptions of automatic spur, bevel, skew and face gear cutting machines, hobbing machines, etc. Tables and rules of gearing are included, making a very complete reference catalogue.

CONVEYING MACHINERY—Catalogue No. 81 General Chain Catalogue from the Jeffrey Mfg. Co., Columbus, Ohio. Contains full description and price lists of their various types of chains and conveying machinery, trucks, hoists and other accessories contingent on the rapid handling and transmission of raw and finished products. The book contains 368 pages and is profusely illustrated. They have also issued bulletin No. 18 descriptive of the Jeffrey electric and air power coal cutters. This illustrates the cut-

ters in actual service and describes fully the method of operation. Copies on request, if this paper is mentioned.

GRINDING MACHINERY—Diamond Machine Co., Providence, R. I., catalogue of grinding and polishing machinery, comprises floor grinding machines, motor driven grinders, wet tool grinders, automatic face grinders, locomotive guide bar grinders, roll grinders, surface grinders, gun barrel machinery, internal grinders, lathe grinder attachments, drill grinders, polishing and buffing machines, polishing wheels, emery wheels, strapping machines, disc grinders, etc.

FOUNDRY BETTERMENT — Knoeppel & Knoeppel, Foundry Specialists, Erie, Pa., have issued an interesting booklet, "Foundry Efficiency Through Betterments in the Engineering and Accounting Branches." As stated on the front of the booklet, "Chemistry of results is just as important to the success of the foundry as a business, as chemistry of iron is to the success of the melting operations." The booklet deals with the betterment of foundry service and may be had by mentioning Canadian Machinery.

MACHINERY—The Waterbury Farrel Foundry & Machine Co., Waterbury, Conn., have issued a general catalogue of 205 pages, 6 x 9 ins., hard covers, printed on bond paper and well illustrated. It forms a general reference book, briefly reviewing their most prominent types. These are divided into several classifications from A to U. Separate catalogues have been issued giving detailed information, these catalogues being indicated by a letter. Section A deals with automatic cold press nut, bolt and rivet machinery, B machinery for manufacturing hinges and butts from sheet steel and brass, C cartridge machinery for making metallic cases, etc., D drop presses, F foot presses and screw presses, G chain draw benches for tubing and rods, H hydraulic draw benches, K knuckle joint embossing presses, L lathes for burnishing, knurling, etc., M single acting open back power presses, N single acting blanking and drawing presses, P double acting power presses, R rolling mills, S shear presses and alligator shears, T finishing machinery, U muffles, casting shops and furnaces.

BOOK REVIEWS.

THE PREVENTION OF INDUSTRIAL ACCIDENTS. By Frank E. Law, M.E., and William Newell, A.B., M.E. Published by the Fidelity and Casualty Co., New York. Price 25 cents.

This is a paper covered book of 190 pages and contains 72 illustrations. It contains a large amount of useful information in regard to the prevention of accidents in various kinds of manufacturing and includes boilers, engines, elevators, together with wood-working and metal-working machinery. Every manufacturer, his superintendents and his foremen should read this book for the information and suggestions that it contains.

Canadian Machine Tool Markets

THE METAL SITUATION.

Despite the usual dullness of trade in December, very fair buying has characterized the metal markets. Stocks being low, except in the case of the larger interests, metal is being wanted all the time, and thus trading keeps busy. From inquiries received it is evident that all classes of consumers are keeping a very close watch on the markets. A very strong tone has developed in all metals, and it looks as if 1910 will show higher prices all the way round.

The home pig iron and steel situation has continued firm through the month. Although there has naturally been some falling off in new business, orders on the books are so heavy that this is not regretted. Delivery is behind hand, and furnaces and mills are contracted away ahead. Imported business is on the quiet side as the larger users filled up their stocks before the close of navigation, but it is evident that before long they must come into the markets again, and pay the enhanced prices. Steel billets are hard to procure. The home plants are out of the open market, and in consequence Continental billets are finding ready sale. The billet situation promises to be a serious one in 1910.

Tin has been fairly active, and the rising prices towards the end of December brought in some extra business. The primary markets were marked by a strong jump in London, caused by some heavy buying on the part, it is said, of a syndicate. This buying is probably to anticipate a good consumption demand later on.

Copper has been rather quiet, but steady business has been done. Prices were advanced under the rumor of the great billion-dollar merger, and although the merger report seems to have lost ground somewhat, prices have not. Producers have not abated their output, and heavy stocks are overhanging the market. Spelter has remained under very strong control both in London and St. Louis, and the firm prices in these markets have been reflected in Canada. The domestic galvanizing interests have bought heavily, and are expected to be in the market again before long, owing to the good trade in the finished articles. Lead has been fluctuating, and is the least satisfactory of all the metals. The demand has been fair, but prices, although advancing, have not done so in a confident way. Imported and Trail lead are now commanding the same price.

MONTREAL.

With the advent of the holidays the general machinery trade in this district has displayed a tendency to simmer down. This fact, however, must not be taken to indicate that deliveries will be hastened. The factories hereabouts and those supplying the dealers here have plenty of orders that will keep them busy for a long time to come without any new business at all.

For a great many machine tool makers and dealers this is inventory time, and the time of the year when most travelers are in from "the road." Many buyers defer placing of business until after stocktaking time, and this, too, has a quieting effect on the trade. Records and inventories show that the past year has been a very good one, particularly the last six months. Regarding the prospects for next year, even the most conservative men in the trade are sanguine that 1910 will be a record-breaker in machinery lines.

Power equipment has felt the same influence as machinery, although a good volume of business was signed this month, particularly in small units. Inquiries are numerous, but the actual orders resulting from these will probably be held over into the new year. Steam specialties are enjoying marked activity, in fact, the last two months' business has been exceptionally good, and 1910 is expected to continue in the same satisfactory manner.

Prices in both machinery and power supplies show a tendency to ease a little, this being due to the fact that the large volume of work, such as is on hand, lowers the cost of production proportionately and salesmen are able to quote better discounts.

Increased business is leading to increased facilities for handling the same. One of the larger of the extensions contemplated is that of the Montreal Steel Works. They have secured a splendid tract of land of about 36 acres in Longue Pointe, East Montreal. The land is bounded in front by the St. Lawrence River. The tracks of the Montreal Terminal Railway, and the Canadian Northern cross at the north giving first-class shipping facilities. It is expected that ground will be broken as soon as the frost allows.

TORONTO.

While business is a little dull around the holiday season, yet the year closed with a good volume of business. The Government trade returns show large increases of each month in 1909 over the corresponding month in 1908. It is expected that the opening of the year will see a great increase in the buying.

Canadian railroads will soon be on the market, placing some large orders. The C.N.R. and G.T.P. are arranging terminal facilities and repair shops, and some good orders for heavy machinery will no doubt be the result. It is expected that the first of the C.N.R. shops will be located in Toronto. This road has been rapidly extending its lines, and has yet no repair shops. Attention must soon be given therefore to repair shops for rolling stock.

In the United States the leading manufacturers of lathes recently announced an advance in prices. The reason given is that many improvements have been made in lathes. Sensitive drills have also been increased. There is no question about the recent improvements made in lathes, the one of to-day having more than double the capacity for work over the one of two or three years ago.

Industries generally in Ontario are busy and there is a good demand for foundry supplies and equipments. The jobbing foundries are busy supplying castings, and machine shops are busier than they have been for two years.

The municipalities in the Hydro-Electric zone in Western Ontario are working together and as soon as the transmission line is ready for delivery, large orders will be placed for electrical equipment. Several British companies have opened up offices in Toronto and are getting a share of the orders for electrical machinery and equipment now being placed.

METAL NOTES.

The Northern Electric Co., of Regina, has been awarded the contract for the wiring of the public building at $1,098.

Ingersoll ratepayers will vote on a by-law for a civic power distribution plant in January. It is estimated that the plant will cost $26,000.

Aylmer, Ont., town council has decided to rebuild the water and light plant destroyed in the explosion some weeks ago, and will instal steam driven machinery as before.

Ottawa electors will on January 3 vote on a by-law to grant the Metropolitan Electrical Co. the right to construct and operate an electric heat and power distribution system.

On March 1, 1910, the Ontario Power Co. must begin the delivery of current to the Hydro-Electric Commission, which has contracted with the company for 30,000 h.p., at $10 a horsepower. The company is now generating 72,000 horsepower. The second tube will just double the output of the plant. The charter of the Ontario Power Company permits it to develop 200,000 horse-power.

It was agreed by the Hamilton board of works to instal 52 street lamps in the Crown Point and Kenliworth districts. The lamps will be taken under the contract with the Cataract Power Co. at the contract price of $47.50 a lamp a year.

At a special meeting of the Bridgeburg Board of Trade which considered the proposed franchise to be given the Canadian-Niagara Power Co., allowing them to transmit electricity through the village, the submission of a by-law to the people was favored.

The Canadian Niagara Power has applied to the Council of Bridgeburg for the privilege of using the streets, highways and public places for the purpose of supplying electricity for light, heat and power. The electors will vote on this question on January 3.

Prince Rupert will shortly have electric light again if negotiations now proceeding between the people of the northern town and the Prince Rupert Sash & Door Co. reach a successful issue. Recently the mill of the B.C. Tie & Timber Co. at Prince Rupert was burned and the electric light plant, which was in the mill, was a total loss.

The Canadian General Electric Co. was awarded the contract for supplying the civic power house at Woodstock, Ont., with a complete five panel switchboard with instruments and regulators; 3 300-kw. transformers; two 1,500-gallon per minute turbine pumps, each driven with one 175-horse-power motor and one 500-horse-power motor to drive the present generator for the sum of $20,000.

Contracts for supplies were recently awarded at London. The Northern Electric Co. was awarded the contracts for 5-16-inch guy wire for $122.50; ¼-inch wire strand at $76.50; light strain insulators, in three sizes, at $105, $120 and $107.50, a total of $332.50, and the Canadian General Electric were awarded the solid guy wire, No. 9, at $26.30; anchors, medium, at $58.41; heavy anchors at $26.93, and guy wire clamps at $20.80.

The Dominion Government have under construction at Chambly Canton, Que., a new power house to take the place of the present one. The capacity will be about 150 horse power generated by a turbine water wheel. The power will be used in the Chambly canal workshops at Chambly Basin and for lighting the canal and government property. The superintendent in charge is Mr. E. Duchesneau. At the time of writing (Dec. 20) no appropriation has been made by the government for the equipment but it will probably go through this session.

The St. Johns, Que., Electric Light Co. have placed a proposition before the town council anent the better lighting of the streets. The company offers to change all the 32 c.p. lamps for 60 c.p. To do this the town would be required to purchase new brackets and lamps, which would amount to $600 or $700. The company would supply the wiring and defray the cost of erecting them, the lamps then to become the property of the company. Under this arrangement it would cost the town $13 per 60 c.p. lamp per year, instead of $12 per 32 c.p., as now paid.

The East View Council has given the first reading to the by-law for an agreement with the Ottawa Electric Company. There will be practically two contracts. One is for ten years, for lighting houses and stores, etc., in East View. The company is to have an exclusive franchise for five years and the rates charged are to be the same as those paid by Ottawans for lighting of stores, dwellings, etc., here. There is also an agreement for lighting the streets of East View with 100 watt Tungsten lamps at $13 each a year. It is claimed that Ottawa now pays $15 annually for a 6-watt light, so it is asserted that the new contract is a fairly good one for East View. The property owners will vote on this on January 3.

The work that the Ontario Power Co. is doing in the Park at Niagara Falls is almost as big as the original venture. Superintendent H. H. Wilson now has 350 men on the job and in the course of a month will have many more in his force. Work will be continued through the winter and Mr. Wilson expects to have it completed some time in July of 1910. In round figures the work means an outlay of $1,500,000. The second tube in which the company is working represents an engineering feat that is unique. The first tube was of steel eighteen feet in diameter, 6,500 feet in length. The second tube will be of reinforced concrete and of the same dimensions of the first tube. So far as is known no concrete tube of that diameter has ever been built.

A. S. M. E. ANNUAL MEETING.

The annual meeting of the American Society of Mechanical Engineers was held in New York, Dec. 7 to 10. A list of the papers presented appeared in the December issue of Canadian Machinery. The officers for 1910 are: Geo. W. Westinghouse, president; G. W. Baker, E. D. Meier, W. F. M. Goss, vice-presidents; J. S. Bancroft, J. Hartness, H. G. Reist, managers; W. H. Wiley, treasurer.

Among the papers presented was one by Henry Hess, on "Line-shaft Efficiency, Mechanical and Economic," which states that the co-efficient of friction of plain babbitted or cast iron shaft bearings ranges from ½ of 1 per cent. to 8 per cent., and that a plant having a coefficient of 3 per cent. is one to be proud of. The remedy for this excessive friction is stated to lie in using ball-bearing hangings on line shafting.

A test conducted by Dodge & Day on a line of 2 7-16-inch shaft 72 feet long is described in detail, with the following general conclusions. The saving due to changing ten 2 7-16-inch plain ring-oiling babbitted bearings running at 214 revolutions per minute to ball bearings increases with increasing belt tension from 14 to 36 per cent. With the usual belt tensions of good practice ranging from 44 to 57 pounds per inch of width of single belt the saving amounts to 36 per cent. and 35 per cent.

The paper concludes with a comparison between the use of ring-oiling and ball bearings on a dollars and cents basis. Here it is shown that taking electric current at a cost of 3 cents per kilowatt-hour for 3,000 hours, the ball bearing returns a saving of 37 per cent. on the excess of their cost over the ring-oiling type.

CENTRAL RAILWAY CLUB.

The regular monthly meeting of the Central Railway and Engineering Club was held at the Prince George Hotel, Toronto, Dec. 21. The business of the evening consisted of an address on "The Manufacture of Commercial Gas," by C. J. Herring, and the election of officers for the ensuing year. C. Jefferis, the retiring President, occupied the chair.

The following were elected officers for 1910: President, J. Duguid, general foreman G. T. R.; first vice-pres., G. Baldwin, general yardmaster Canada Foundry Co.; second vice-pres., J. Bannon, chief engineer, city hall, Toronto.

Executive Committee—Messrs C. A. Jefferis, W. R. McRae, O. A. Cole, A. M. Wickens, A. E. Till and A. Taylor, Toronto, and Mr. Patterson, Stratford.

PLAYING WITH FIRE.

A can of gasolene can be handled as safely as a can of oil, for liquid gasolene does not explode. It is the gasolene vapor that is highly explosive when properly mixed with air. The Scientific American recently published three illustrations showing the safety with which burning gasolene may be handled. One showed a man pouring burning gasolene from one can into another. In a second he was blowing into the spout of a can of gasolene to which a match had been applied. The little blue flame that ordinarily plays around the mouth of the can was transformed into a burning torch. The third showed a pool of burning gasolene on the floor, and two gasolene cans aflame, but there was no explosion.

There is all the difference in the world between an attempt to study by mere reading and a real study through the actual doing of work.—Prof. John Perry.

The Art of Welding Metals

The use of the ***Oxy-acetylene blow-pipe*** in welding has greatly extended the field in this class of work.

Simple or complicated fractures and breaks in all kinds of machinery may be repaired and made almost equal to new in strength and appearance; the broken edges of iron, steel, aluminum and other metals are melted together with the addition of more metal under a temperature of 6,000 to 7,000 degrees Fahrenheit.

This plan is much superior to brazing or riveting and may be used for an infinite variety of new and repair work hitherto done by less efficient methods.

We have installed a plant for the purpose of welding by this process, and shall be glad to send particulars and quote prices.

Enquiries and correspondence solicited.

New Standard

A New Standard

The "Stantool"

SHORT TAPER SHANK WITH HEAVY TANG

modern methods of drilling demand a stronger construction of shank and tang than the old standard. The "Stantool" shank meets this condition. It has much greater strength, offers a positive drive and overcomes the breakage which has heretofore been a serious difficulty.

"Stantool" Sockets and Sleeves

fit the new standard shank and are made to fit the taper spindle of all makes of drill presses.

Old Standard

THE STANDARD TOOL CO.

Cleveland, Ohio. 94 Reade St., New York

First-class Mechanics

always recommend and use

BUTTERFIELD

TAPS, DIES AND REAMERS

because they are honestly made tools, thoroughly tested and made to wear. Quality tells in the long run, and you will be banishing shop troubles if you are using Butterfield tools.

USE

BASSITE

As a substitute for Tin in your brass castings.

WHY?—

A pound of Bassite will solidify a greater proportion of copper than one pound of tin.

It makes castings cheaper, cleaner and tighter than is possible with tin. Will not burn in the sand.

Bassite is not a theory—not an experiment.
It is a practical success—Tried and Proven.
Does this difference in cost interest you?

Tin at 32½c. per lb. Quantity one ton, Total....$650.00
Bassite at 20c. per lb. Quantity one ton, Total....400.00
Actual saving in cost per ton being.....$250.00

Send us your trial order. No pay if unsatisfactory. Bassite will do just what we claim for it and we will stand back of our proposition to you. Try us.

The Bassite Smelting & Mfg. Co.
1015 Second National Bank Bldg.
CINCINNATI, OHIO
WORKS—Cincinnati and Milford, Ohio

HIGHEST GRADE FIRE BRICK

FOR

CUPOLA LININGS

Do you figure prices per thousand brick or costs per ton of iron melted?

If the latter, we can help you. Our foundry records show it. Let us take it up with you. Quality tells.

BOILER SETTINGS

The grade that practically insures your settings when running overload, whether hand fired or mechanically stoked.

Your request will bring Catalog and full information.

MACHINERY FOR SALE.

FOR SALE—New and second hand Curtis Multiple Spindle Automatic Screw Machines, covered by United States patent Nov. 4, 1902; Canadian patent Jan. 20, 1903; English patent Feb. 26, 1903, and Belgium patent No. 167791. The John Morrow Screw, Limited, Ingersoll, Ont. (12)

ONE 34" Oesterlein Plain Milling Machine, new. Kellogg & Co., 196 King St. West, Toronto.

3½ H. P. Gas Engine, complete with accessories, in first-class order. Kellogg & Co., 196 King St. West, Toronto.

FOR SALE.

FOR SALE—1 Gurney Scale Co. Foundryman's Testing Machine, with deflection indicator. Good as new. Standard Ideal Co., Port Hope.

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

PATENTS.

THE PROPRIETOR of the Canadian Patent No. 83902 "Improvements in camdises for operating the exhaust valve in four-stroke combustion engines," is desirous of entering into arrangements, by way of license or otherwise, for practically working the patent. For particulars apply to "Reversator," care of S. Gumaelii, Annoncebureau, Stockholm, Sweden. (10)

SUPERINTENDENT WANTED.

A PRACTICAL SUPERINTENDENT, experienced in the manufacture of Traction Engines and Threshing Machines, to take charge of plant. Apply, stating experience, Box 91, CANADIAN MACHINERY, Toronto. (9)

FIRE PROOF SAFES, VAULTS, ETC.

YOU need the best possible protection from fire! If your valuables are in one of our safes you can rest at ease; no fire is too hot for our safes and vaults to withstand. We manufacture vaults and safes to meet every possible requirement. Write for catalogue "S." The Goldie & McCulloch Co., Ltd., Galt, Ont. (tf)

MISCELLANEOUS.

ANY MAN who has ever lost money in the mails has had occasion to learn by painful experience that the only proper way to remit money is by Dominion Express Money Orders and Foreign Drafts. If lost or delayed in the mails, a prompt refund is arranged, or new Order issued without further charges. (tf)

BEFORE BUYING OFFICE FURNITURE, FILING SYSTEMS AND SUPPLIES, see our catalog. Our Modern goods at moderate prices will result in money-saving and satisfaction. Write to-day, stating your requirements. Benson Johnston Co., Ltd., 8 John St. N., Hamilton.

DOUBLE YOUR FLOOR SPACE. An Otis-Fensom hand-power elevator will double your floor space, enable you to use that upper floor either as stock room or as extra selling space, at the same time increasing space on your ground floor. Costs only $70. Write for catalogue "B." The Otis-Fensom Elevator Co., Traders Bank Building, Toronto. (tf)

ELLIOTT-FISHER STANDARD Writing-Adding Machines make toil easier. Elliott-Fisher Limited, 513, No. 83, Craig Street W., Montreal, and 129 Bay Street, Toronto.

HARRISON FISHER CALENDARS for 1910 make excellent Christmas or New Year gifts. Five pages in full colors. Size 14 x 22 inches. Pictures may be removed and framed at the end of the year as they are only "tipped" on the mounts. Price $3 boxed. Copp, Clark Co., Ltd., Toronto, are Sole Agents for Canada. (tf)

KAY'S Furniture Catalogue No. 36 contains 160 pages of fine half-tone engravings of newest designs in carpets, rugs, furniture, draperies, wall papers and pottery with cash prices. It brings you into close touch with the immense stocks and splendid manufacturing facilities of John Kay Company, Ltd., 36 King St. West, Toronto. Write for a copy to-day. It's free. (tf)

MR BUSINESS MAN, are you progressive? It's up to you to test "Consolidated," our new process carbon paper. Because it costs less. Soft finish, without smutting, and clear, permanent copies. Write for sample sheets and prices. "Consolidated," Stratford, Ont.

SAVE 70% OF YOUR LIGHT BILL by using the "Just" Tungsten Lamp. Fits any socket. Burns any angle. All candlepowers from sixteen up. Prices as low as 50 cents. Better write us to-day. Sterling Electric Supply Co., Ltd., 369 Yonge St., Toronto, Ont. (tf)

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley Street, Toronto. (tf)

"SYSTEMS" stand for all that is best in loose-leaf binders and supplies, letter-heads, statements and in fact your office stationery of every description. Send us samples of what you are using—we will send you prices that will interest you. Business Systems, Limited, Manufacturing Stationers, Toronto. (tf)

THE "Kalamazoo" Loose Leaf Binder is the only binder that will hold just as many sheets as you actually require and no more. The back is flexible, writing surface flat, alignment perfect. It cannot get out of order. No exposed metal parts or complicated mechanism. Write for booklet. Warwick Bros. & Rutter, Ltd., King and Spadina, Toronto.

USE THE BEST CARBON PAPER. Our "Klear-Kopy" carbon gives clear, unsmudged copies of your letters and other documents. It has been selected by a leading government against 43 competitors. "Peerless" typewriter ribbons give clear letters and will not clog the type. Sold by all dealers. Write us for samples. Peerless Carbon and Ribbon Co., Toronto. (tf)

WE HAVE eight rebuilt Visible Oliver Typewriters for sale. The price is $30.00 each, and at that figure they are a bargain and should not be on the market long. Monthly payments can be arranged if desired. The Monarch Typewriter Company, Ltd., 98 King West, Toronto.

GET THE BUSINESS—INCREASE YOUR SALES—Use Multigraph typewritten letters. Typewritten letters, three thousand per hour on the Multigraph. The Multigraph does absolutely every form of printing. Saves you 25 p.c. to 75 p.c. of your printing bill. Multigraph your office forms, letterheads, circular letters. Write us. American Multigraph Sales Co., Ltd., 129 Bay St., Toronto. (tf)

MODERN FIREPROOF CONSTRUCTION—Our system of reinforced concrete work, as successfully used in many of Canada's largest buildings, gives better results at lower cost. "A strong statement," you will say. Write us and let us prove our claims. That's fair. Leach Concrete Co., Ltd., 100 King St. West, Toronto. (tf)

WHEN buying bookceses insist on having the best in the market—"Macey Sectional Bookcases." Carried in stock by all up-to-date furniture dealers. Illustrated booklet sent free on request. Canada Furniture Manufacturers, Ltd. General offices, Woodstock, Ont. (tf)

WANTED---A splendid opportunity for dealers to handle the best combination Duplicating, Addressing and Office Printing Machine on the market. Exclusive territory. Send name and address, giving occupation and references, to the Canadian Writerpress Company, Ltd., 33 John St., Hamilton, Ont. (tf)

YOU CAN DISPLAY YOUR GOODS TO BETTER ADVANTAGE through the use of up-to-date fixtures. We are specialists in the planning of stores and offices. Our catalogue contains illustrations of many new features and several handsomely equipped stores and offices. Shall we send you our catalogue J? Jones Bros. & Co., Ltd, 30-32 Adelaide St. West, Toronto. (tf)

ABOUT six months ago we booked an order for shipping tags (the cheapest kind we make) for a Company shipping castings and machine parts.

The other day they wanted another lot of tags and we suggested using a tougher tag. It didn't take much to persuade them, as the cheaper tag was not sufficiently strong to carry their heavy merchandise. We are now running their order on a four grade better tag.

Let us check up your tag situation.
Samples of all kinds on request.

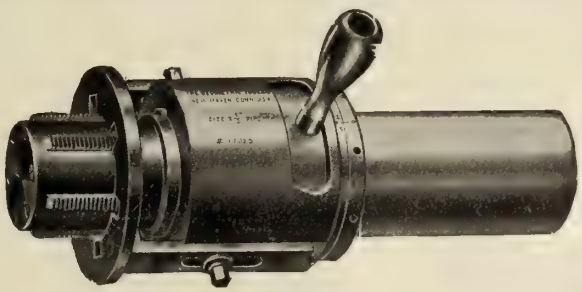
THE L. S. STARRETT CO., ATHOL, MASS., U. S. A.

The user of solid taps is wasting valuable time, which also means a waste of money.



The only way to overcome this is to instal an equipment of the

GEOMETRIC ADJUSTABLE COLLAPSING TAPS

These instantly collapse when the desired depth is reached, and can then be withdrawn without the chasers touching the work, which cuts the time down one-half. This does away with the damage to the threads and breaking of taps so objectionable in backing out solid taps.

The chasers can also be adjusted to tap slightly larger or smaller than the size for which the tap is made.

If you want a saving in your tapping cost, write us for particulars.

This Barrel Leaks Your Money

¶ Every wooden shop barrel you have is leaking away your money. You are paying more than you used to for wooden barrels — but even when you bought them cheapest you were really losing money that you might have saved with our STEEL SHOP BARRELS.

¶ Steel Shop Barrels you'd need, cost just about what you would pay for wooden barrels used during a year. But the second and third, and maybe other, years you would buy no barrels at all. That looks like 100% a year saving, doesn't it?

¶ Besides, our Steel Shop Barrels are easier to handle, take up less room, look better, and don't fall apart when you are not expecting it—or any other time.

¶ Even a small shop can save hundreds of dollars a year with our Steel Shop Barrels, Boxes, and other money-saving things for factories.

Francis Hyde & Company

WE wish to extend our sincere thanks to our many friends who through their orders and good fellowship have contributed to our success, and trust that the incoming year will be productive of results beyond their most sanguine expectations and that the mutually beneficial relations which have existed will continue—and grow.

A Hint as to the Future

¶ It is the general opinion that Canada is about to experience an unprecedented industrial boom, and, in view of this, it is a lamentable fact that most of our factories are not supplied with equipment which will enable them to handle their full share of the business, the result of which will be that money which should be spent in Canada, will find its way into foreign markets.

¶ We have been optimistic, and in the dull times—which luckily have passed away—have added several machines which almost double our capacity, and can now manufacture and deliver a full shop equipment of KING Oil Furnaces in from four to six weeks.

¶ Those who are skeptical as to our "Canadian product" not being as good as "foreign manufacturers" we ask to look around and see what their competitors are doing ; you still have time to get your order in and have the furnaces in time for this year's output.

¶ Sole patentees and manufacturers of Jacobs' Burners and KING Oil Furnaces, patented in all countries.

¶ It must be acknowledged that, since our advent into the Foundry Equipment and Supply business, the Foundryman is getting a "more even break" and we certainly take to ourselves the credit for this change.

¶ It is not our intention to follow the lead of some of our competitors and endeavor to demonstrate how big we are and how small the other fellow is—that is for you to judge. We wish to advise that the high standard we have set ourselves to follow will be rigidly adhered to, and improved as occasions and opportunities present themselves.

¶ A line asking for prices and samples will be greatly appreciated.

¶ Bear in mind that we manufacture as well as sell Equipment and Supplies.

Francis Hyde & Company

Ontario - Canada

Power House at Decew Falls of Dominion Power and Transmission Co., Ltd., and Lincoln E. L. and P. Co., Ltd.
2½ miles from St. Catharines, 100,000 H.P.

WHY? BECAUSE——

1. TWENTY-EIGHT PLANTS have located here for good reasons—most of them Metal-working Industries.
2. ELECTRIC POWER is cheaper here—right where it is made—than elsewhere. Less than one-third the cost of steam.
3. WATER SUPPLY is from Lake Erie, with a head of about 200 feet.
4. FREIGHTS are as cheap here as if we had 100 railroads. BESIDES, you can use our port for water shipment to all great lake points and to salt water.
5. LABOR—Good supply of skilled mechanics and laborers. Cost workmen own their own homes. They come to stay.
6. SITES are available for YOU to choose from, all good ones, and to be got at figures and terms which are big inducements.
7. INCIDENTALLY—We are one hour (by electric and steam railways) from Niagara Falls and Hamilton.

ALSO—St. Catharines is the market and shipping point for Canada's Greatest Fruit District——

Pattern Making

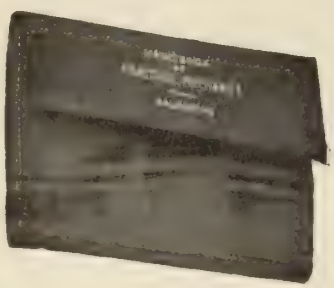
By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions



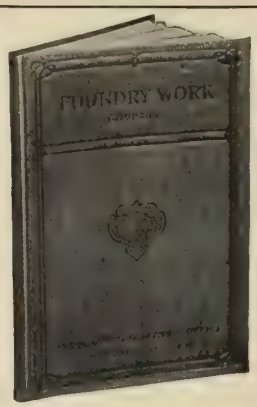
Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

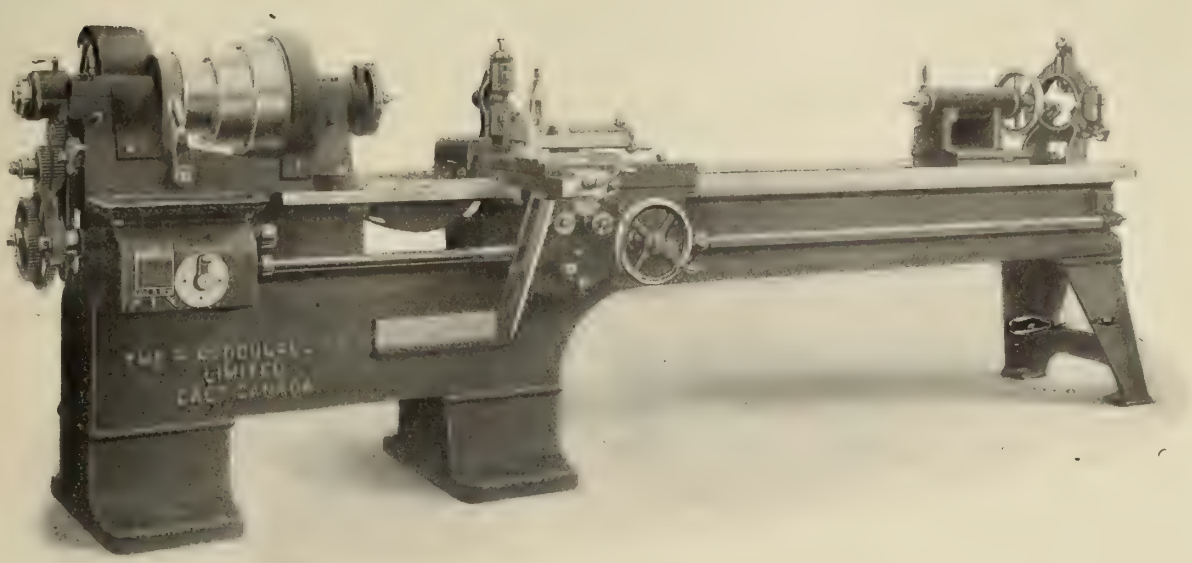
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

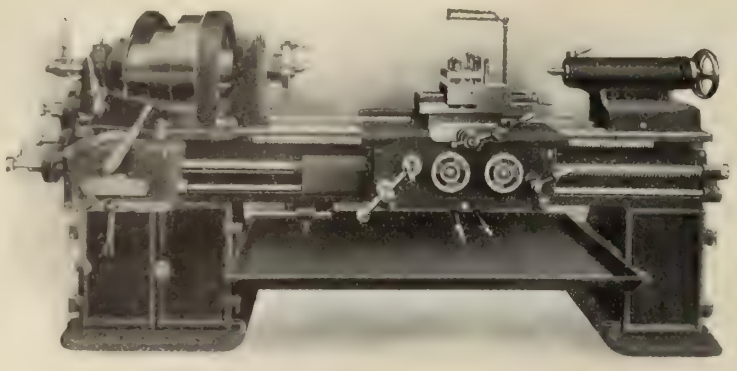
The R. McDougall Co., Limited

The Canadian Fairbanks Co., Sales Agents. GALT, CANADA

ENGINE LATHES

(12-inch to 56 inch Swing)

Manufactured by DEAN, SMITH & GRACE, LTD., of Keighley, England, who are considered second to none in the manufacture of tools of this description.



In general specifications these lathes surpass all others and will be found to withstand the heaviest cutting without strain. The beds are of strong box section with large wearing surface, and we claim that this type of bed is superior to the numerous narrow guide types which have been put on the market.

These lathes are manufactured with or without friction geared heads and with hollow steel spindle which is accurately ground and runs in ample parallel bearings of phosphor bronze.

Gearing is correctly graded to uniform rate of speed. Complete and illustrated catalogue describing these machines will be sent on application.

In addition to the above we carry a complete range of machine tools of every description, including Automatic Machines, Horizontal Boring and Turning Mills, Planers and Slotters. Bolt and Nut Machines, Cutting-off Machines, Drilling Machines, High Speed Cold Saws, Turret Lathes, Brass Finishers' Lathes, and special machinery of every description.

We also carry Ultra Rapid High Speed Twisted Drills and Ultra Rapid Water Hardening High Speed Steel and special steel for all purposes. Wood-working Machinery, Chain Blocks, Pneumatic Tools, etc., etc.

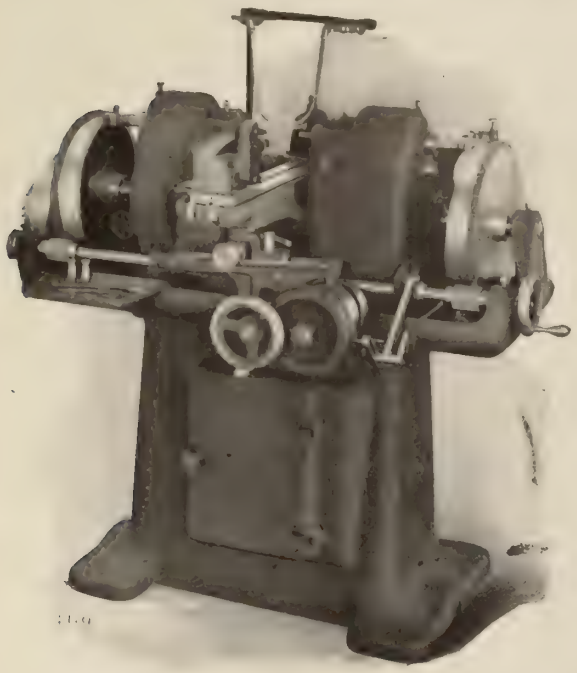
Reduce the Manufacturing Cost

Of Standard Taper Drill Sockets, Adjustable Wrenches, Gun and Rifle Breech Blocks, Sliding Mechanisms of Any Kind.



P. & W. Spline and Tang Slot Milling Machine.

The P. & W. Spline and Tang Slot Milling Machine.

The Machine that has replaced the multiplicity of operations to obtain a tang slot or similar work by one, simple, direct, automatic operation.

Dispenses entirely with the broach and hand miller.

Requires no starting hole or layout.

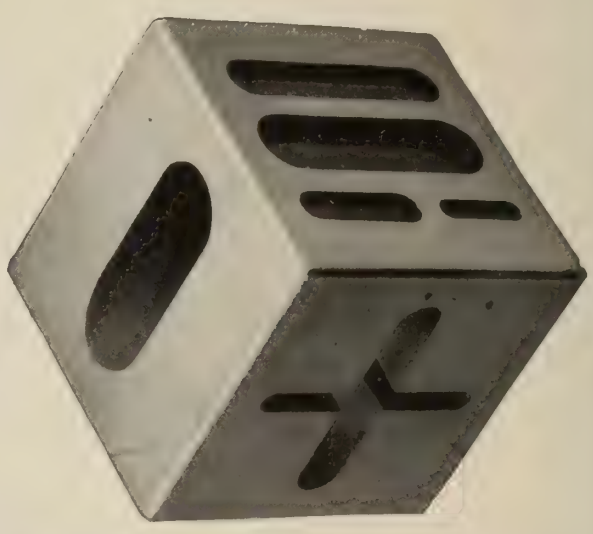
Works ten times faster, with greater accuracy and with a superior finish over any former methods.

Cuts slots from $^{1}/_{16}$ to 1 inch in width, up to 5 inches long, and through 5 inches of solid metal.

Permits turning out an article of superior action and reliability at a greatly reduced cost.

Shows marked economy on any article having a sliding action.

Cutters used are cheaper than drills or mills and considerably cheaper than any broach.



Specimen work, exact size, done on a P. & W. Spline Miller. Right face shows key-ways. Slots on top and left face are cut completely through.

One man can operate several machines.

Write for Catalog "Spline Millers."

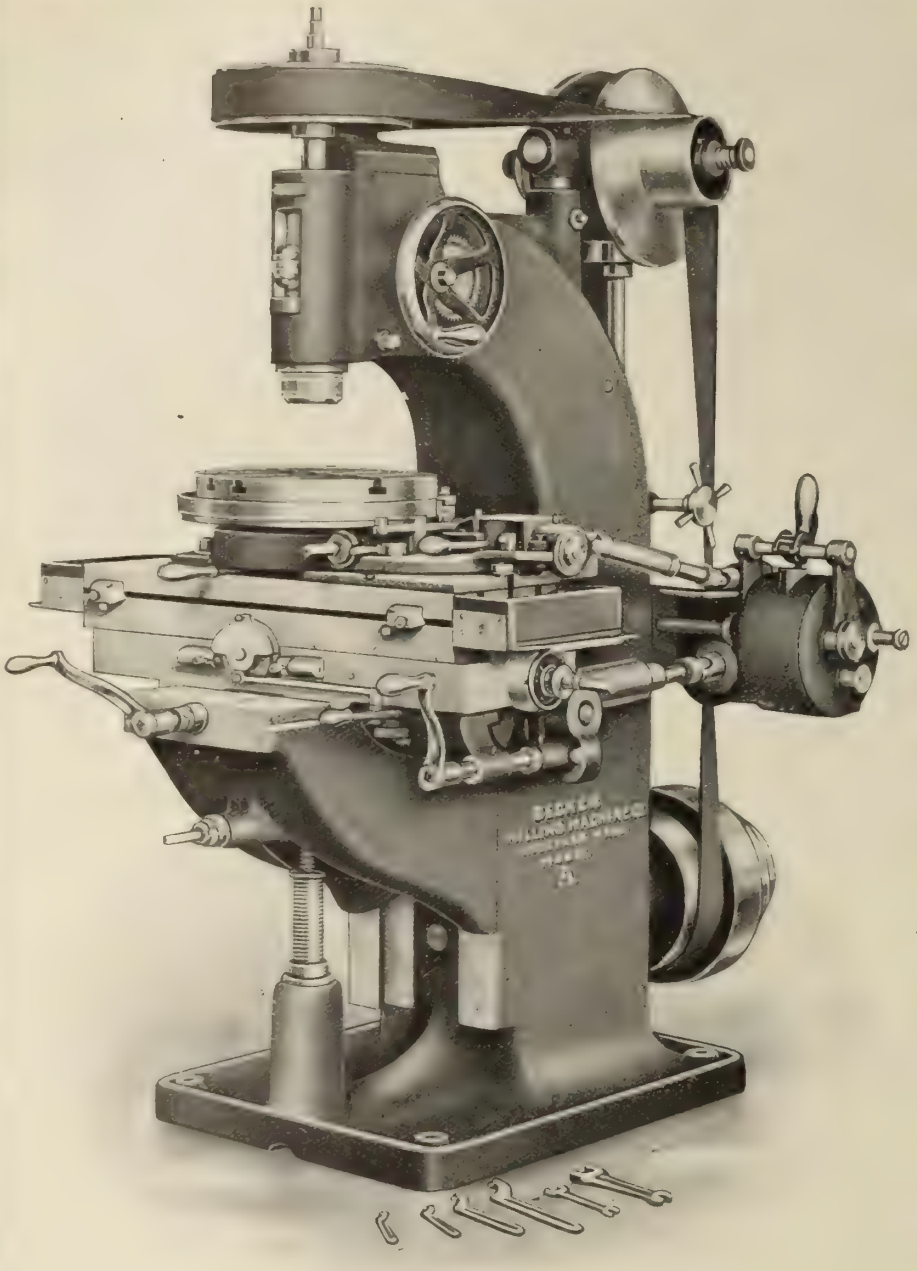
Trimo Tools are Made by

TRIMONT Manufacturing Company, Roxbury, Mass. (Boston)

New Model A
Becker Vertical Milling Machine



of entirely **new** and **improved construction,** embodying the following features:

Simplicity of construction.

Ease of manipulation.

Maximum results in reduction of metal with minimum consumption of power.

Great rigidity when under heavy cuts and fast feeds. Powerful table feeds, variable and unlimited up to maximum.

The machine herewith illustrated shows the smallest size of this type, open belt spindle drive with cone counter-shaft. We also furnish the Model A with constant speed drive (no counter required) and back-geared spindle for heavy work.

For further information write to the

Becker Milling Machine Co., Hyde Park, Mass.

The Cincinnati High Power Miller Gearing

One of the Cincinnati, forged steel, spindle driving gears, with accurately-cut teeth, having 20° pressure angle. Note the great strength indicated by their large root section.

ALL the spindle drive gears on our High Power Millers are made from steel forgings.

Our gear teeth have a 20° pressure angle, which produces teeth having an unusually large root section and correspondingly increased strength.

Our gear train is of the simplest form.

There are only 12 gears altogether between the driving pulley and the cutter.

Only a few of these are used at one time. For example– each one of the eight fast speeds is obtained by driving through only the two tumbler gears, the cone gear and one of the sliding gears; only one gear more than has always been used on the ordinary single back geared machine.

The eight slow speeds employ the additional gears, I J K and L, which provide a total Back Gear Ratio of 25 to 1 on the larger machines.

All the other gears in each case are idle, held in reserve **for providing changes in speed.**

None of the shafts are subjected to combined bending and torsional strains.

All shafts are supported in adequate bearings at both ends.

The pulley runs on a bracket (W), relieving the driving shaft of the belt pull.

Transmission for all speeds is through the face, gear keyed to the spindle close to the front box, relieving the length of the spindle from torsional strains.

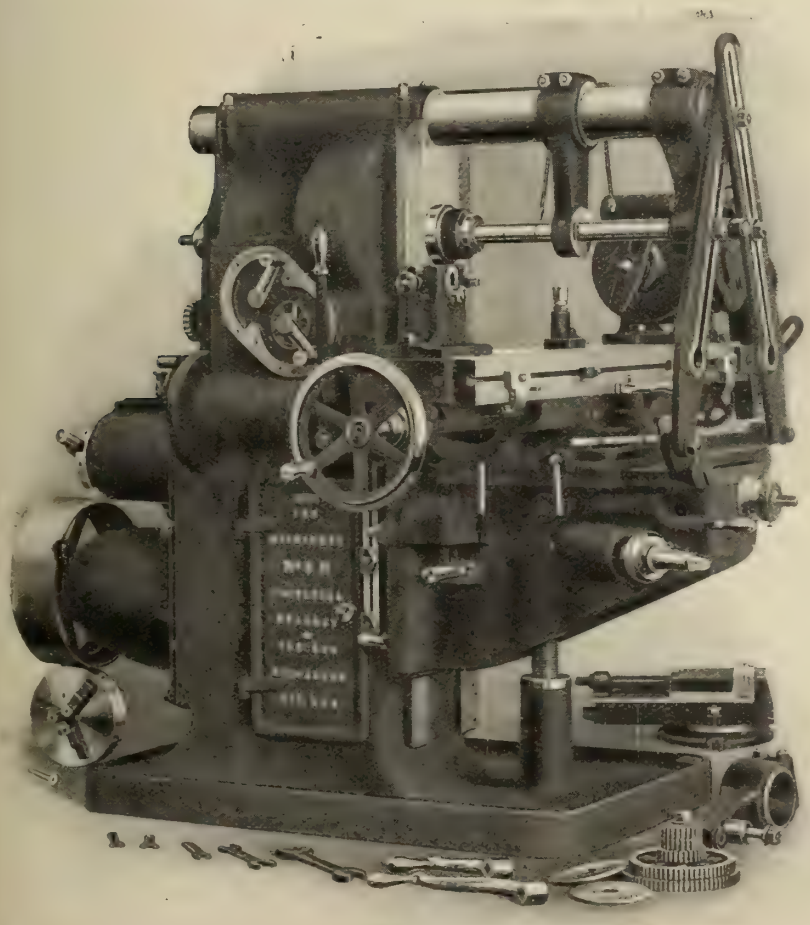
Never any gears in mesh except those needed to give the speed being used.

Tumbler automatically clamped to its bearings on the machine frame at each one of its positions, eliminating vibration in these parts.

The Cincinnati Milling Machine Company

Cincinnati, Ohio, U.S.A.

Canadian Agent—H. W. Petrie, Limited, Toronto, Montreal and Vancouver



THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

Let us send you more particulars.

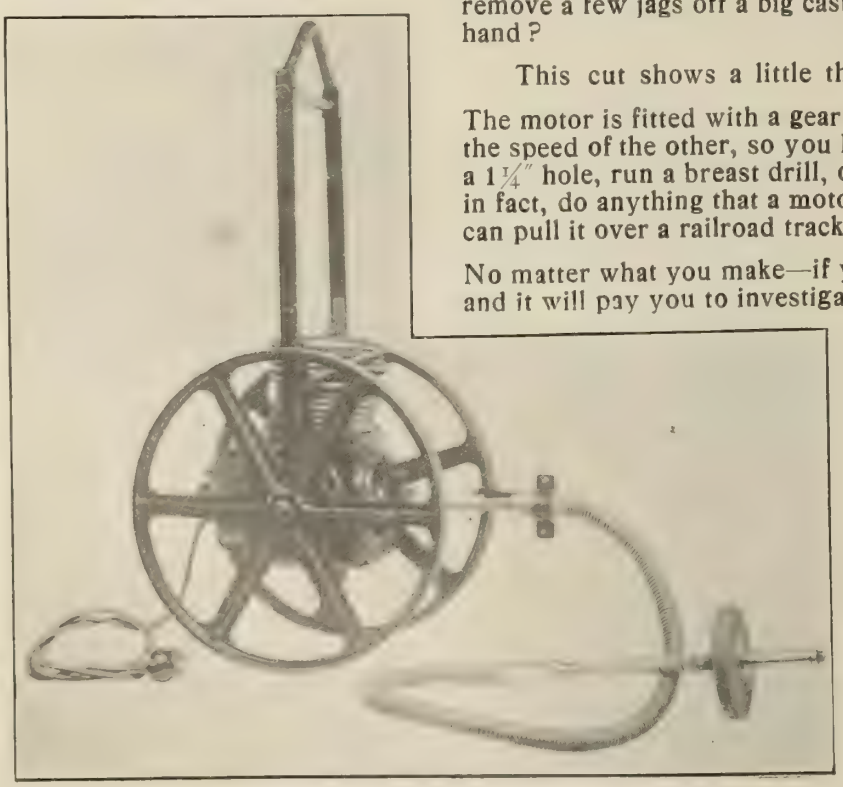
New Haven Manufacturing Company - New Haven, Conn., U.S.A.



PORTABLE ELECTRIC MOTOR

Have you ever had to drill a few holes in an awkward place, or to remove a few jags off a big casting, and spent a lot of time doing it by hand?

This cut shows a little thing, but a **BIG LABOR SAVER.**

The motor is fitted with a gear and two shafts, one running four times the speed of the other, so you have a big range of speed. It will drill a 1¼" hole, run a breast drill, or a hand grinder, expand a boiler tube; in fact, do anything that a motor will do. Note the big wheels, a boy can pull it over a railroad track with ease.

No matter what you make—if you use a tool—you've got a use for it and it will pay you to investigate.

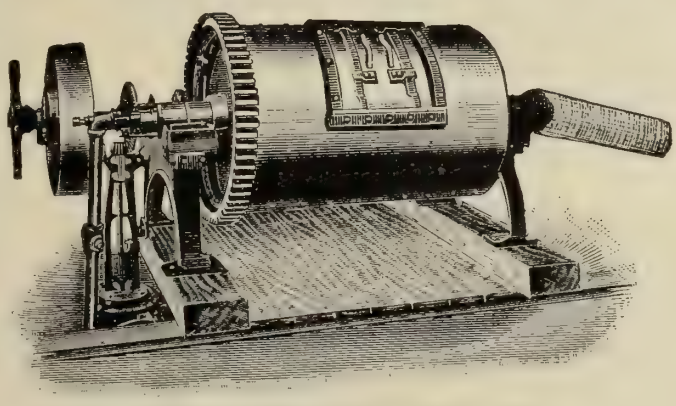
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

JUST LOOK AT THIS

Improved Power Hack Saw

It is better made than any tool of a similar nature you ever saw before. Only the best of material is used in its construction, and your particular attention is directed to the improved arm and saw guide which keeps the saw perfectly in line. This saw cuts either round or square bars 6x6 in., and requires no attention after the work is in the vise.

IT STOPS AUTOMATICALLY WHEN THE PIECE IS CUT OFF

"BLISS" ARCH POWER PRESS

For a Varied Product in a Limited Space

Bliss Arch Power Presses

Meet the Requirement.

BLISS

These Presses, built in several sizes, are exceptionally handy and convenient. They are designed for heavy work, such as: Stamping Petroleum Can Sides, Cutting Spoon and Frying Pan Blanks, Cutting and Stamping Coal Hod Bottoms, Fire Shovels, Metallic Shingles, etc. In the manufacture of Enameled Iron and Tinware, they operate almost all the combination, cutting and forming dies. A removable front piece to bed permits of the use of horns, forces and wiring dies.

"We Build Presses for Every Purpose."

Canadian Hart Wheels

442 Barton St. East, Hamilton

Corundum and Emery Wheels, Grinding Machines, Beaver Oil Stones.

DON'T relegate those apparently unmachinable castings to the scrap heap.

NOVO SUPERIOR
HIGH-SPEED STEEL

has already saved hundreds of castings from this fate.

Will readily cut castings which could not be touched with the best standard high-speed steels.

One customer writes: "We have been using a NOVO SUPERIOR tool continually for the last four weeks on cast iron fly wheels running at a speed of from 15 to 25% higher than we had been able to run with —— High-speed Steel. During this time we have used up but one inch of the tool. . . . . We have not yet hardened the tool the second time" etc.

Have you any NOVO SUPERIOR in your shop? If not, send us a trial order and convince yourself of its remarkable qualities.

WRITE FOR FURTHER PARTICULARS.

HERMANN BOKER & CO., 332 St. James St. MONTREAL

NEW HIGH-SPEED STEEL

Engineers now have the opportunity of using a much more durable Steel than the best High-Speed Steel hitherto used, and this they will find in our

Allen's IMPERIAL Special (The new improved) High-Speed Steel

which may be either air-hardened, oil-hardened or water-hardened.

This ***Imperial*** Special Steel will cut much harder materials than can be cut with Tools made of ordinary best High-Speed Steel, and heavier cuts may be taken, or Machines may be driven at accelerated speeds when (in either case) it is found economical to do so. ***Imperial*** Special will also wear much longer than ordinary best High-Speed Steel before requiring to be re-ground.

IF YOU WANT A BETTER QUALITY OF STEEL than that you now use, we shall be glad to receive your orders for our

This Barrel Leaks Your Money

¶ Every wooden shop barrel you have is leaking away your money. You are paying more than you used to for wooden barrels — but even when you bought them cheapest you were really losing money that you might have saved with our STEEL SHOP BARRELS.

¶ Steel Shop Barrels you'd need, cost just about what you would pay for wooden barrels used during a year. But the second and third, and maybe other, years you would buy no barrels at all. That looks like 100% a year saving, doesn't it?

¶ Besides, our Steel Shop Barrels are easier to handle, take up less room, look better, and don't fall apart when you are not expecting it — or any other time.

¶ Even a small shop can save hundreds of dollars a year with our Steel Shop Barrels, Boxes, and other money-saving things for factories.

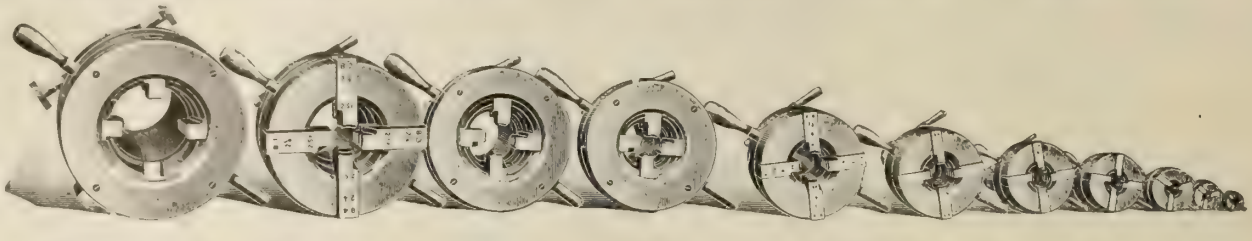
Do You Use Screw Machines or Turret Lathes?

IF SO

Do you use the Geometric Self-Opening Screw Cutting Die Heads, or are you going on in the same old way that your grandfather did and using solid dies, wasting half your time backing off after each thread is cut, stripping or injuring a good part of the threads.

You will never know what you are losing, nor will you know what you can save on your screw thread cutting until you give the

Geometric Screw Cutting Die Heads a chance to show you



There is a Geometric Die for every size, pitch, length or form of thread that you may wish to cut, or for any range of sizes, and if you will tell us what your requirements are we will be very pleased to give you our best advice with full particulars of the tool equipment best suited to your needs.

Our tools can be had from any maker of Screw Machines and Turret Lathes, or from our Agents.

A. R. WILLIAMS MACHINERY CO., Toronto, Ont.

STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH

Improved Levels For Testing Shafting, Etc.

In addition to the regular parallel vial, the bases have a cross level which enables one to place or hold the base on a shaft level in its cross section, not canted sidewise; for the shape of a level glass is such that, though true as adjusted on a flat surface, it will not be reliable when canted sidewise. Hence the value of the cross level, not only to test the truth of shafting, but other surfaces which tend to throw the level base into a canting position.

The base of this level has our improved concave groove running through the length of its base, leaving a flat margin each side, which improves its seat for flat work, while forming an absolutely true and reliable seat for shafting, etc., and it is better than a V groove. Made in 6, 8, 12 and 18 in. sizes, with plain vials and with plain and graduated vials.

FACTORY HEATING AND VENTILATION
BY
The Simplest and Most Economical System Known

The SHELDON FAN SYSTEM
CONSISTING OF

A Pipe Coil Heater, using exhaust or live steam, or both, which can be arranged for gravity return to a boiler located on the same floor.

A Blower, fitted with Sheldon Multivane Runner, which can be operated by any convenient power, most economically by a Direct Connected Engine, the actual operating cost of which amounts to only a small percentage of the heat in the steam passing through the fan engine, the remainder being utilized in the heater, into which the engine exhausts.

Fan, Heater and Engine are centralized in one compact apparatus.

The Fan can be so arranged to take all or any part of its air supply from outside or inside the building, as desired.

The warm air is conveyed through ducts or flues and distributed throughout the entire building.

Let us tell you more about it.

First Aid to Injured on a Great Canadian Railroad

The System Used in the Angus Shops, Montreal, Giving Full Information as to the Carrying Out of the Scheme on the C.P.R., with Illustrations.

By S. A. GIDLOW

One of the most popular movements on the Canadian Pacific Railway, of recent organization, is that of First Aid to the Injured, as carried on under the auspices of the St. John Ambulance Association.

First of all, in order that the reader may understand the importance and value of first aid both to employer and employe it may be well to give a brief outline showing what "First Aid" really is; what its objects are and the results of proper and improper first aid treatment, and I think the question, "What is first aid?" is best answered by stating what its objects are.

1st. To teach all people, outside of the medical profession, to render assistance to any person suffering accident or sudden illness until the arrival of the doctor.

2nd. To teach people what not to do in case of accident, so that there shall be no likelihood of a sympathetic but ignorant public causing unnecessary pain and suffering through improper treatment.

3. That in case of emergency, that is, bleeding, poisoning, choking or drowning, a life may not be sacrificed for the want of a little elementary knowledge on the part of the bystander.

The following particulars of an accident which occurred some little time ago show what terrible harm can be done by improper first aid treatment:

"A man was knocked down by a street car causing a simple fracture of the left thigh bone, that is to say, the bone only was broken and none of the parts adjacent thereto, such as the tissues or artery, were injured or cut. The onlookers, with the idea of getting the poor fellow out of the way of passing traffic, lifted the man to a perpendicular position with the weight of his body on the broken leg, thereby causing the broken bones to become further displaced and to pierce the femoral or main artery of the thigh. As a result of this well meant action on the part of the public the man died from loss of blood in a few minutes. He was killed by a well meaning but ignorant public. Had the driver or conductor in charge of the street car in question been instructed in the elementary principles of first aid, and made use of such knowledge, the man would no doubt have been alive to-day, and the street car company saved heavy claims for damages.

Fig. 1.—S. A. Gidlow, General Secretary.

Compare the above with an accident which occurred in a machine shop recently, and where proper first aid was rendered as below:

"A man was caught by machinery and had his arm so lacerated that all the muscles were torn off and the brachial (arm) artery severed. He would have died of hemorrhage in a few minutes had it not been for the valuable aid afforded by a member of a First Aid Corps, who caught up the artery and controlled the bleeding by digital pressure until a tourniquet was procured, which he placed in position. The man was then removed to the hospital, where the arm had to be amputated at the shoulder. The assistance rendered by the first aid man was highly spoken of by the medical officer of the hospital, as there was no doubt it saved the other man's life."

These are only two of hundreds of cases where life has been lost, or, on the other hand, saved, depending on the ability of the bystander to render proper or improper treatment just when the accident occurred.

One can readily see from the instances given above what incalculable benefit

Fig. 2.—A First Aid Class at the Angus Shops.

first aid is to the railroad employe and the public generally.

The Need of Instruction.

The success of present day surgery is, in a great measure, due to the attention given to simple details in the preparation of the case prior to operation. Now, if preliminary care means successful operation, why should it not have every consideration in the treatment of accidents constantly happening in all our works and on the streets?

Fig. 3.—A First Aid Class Composed of Lady Clerks at Angus, the General Secretary, Secretary for Montreal District C.P.R. and a Boy Patient.

If an ambulance man, by reason of his ability to render immediate attention, can sustain life until such time as medical assistance can be obtained, surely he is rendering great service, not only to the medical profession but to the person who suffers accident, also to the firm for whom he may be working and whose employe he is aiding. The needless suffering caused by the ignorance of unskilled persons is as undoubted as it is deplorable. By rough handling, or for want of the slight knowledge necessary to enable one to support an injured limb, very serious consequences may ensue. To arrest bleeding from an artery is quite easy, yet thousands of lives have been lost in the presence of helpless spectators who had not been taught that little knowledge necessary to enable them to give intelligent first aid to the sufferer.

Accidents are of daily occurrence in all large works, yet, how many of their employes are capable of rendering first aid pending the arrival of the doctor.

All the great railroads in the Colonies (outside of the Dominion) have had many thousands of their employes instructed in First Aid to the Injured, which goes to show that it pays, aside from the humanitarian standpoint, to have men around our works who can give immediate assistance in case of accident or sudden illness.

The Canadian Pacific Railway Centre of the St. John Ambulance Association, have, for some time past, realized the value of this movement to their employes and to themselves, as is seen from the fact that they have a large and complete organization at their works in Montreal, both in the car and locomotive departments, and now every shop has its quota of ambulance men, so that no matter in what part of the works an accident may happen there you will find an ambulance man, ready and willing to give immediate help.

The cost of instruction, and the books and first aid material necessary, are furnished by the management free of charge. A lecturer is provided who gives one lecture per week to the men until the full course of five lectures has been given.

The syllabus of instruction is as follows:

First Lecture.

A. Preliminary remarks, objects of instruction, etc.

B. A brief description of the human skeleton, bones, joints, and the muscular system.

C. Signs, symptoms and treatment of fractures, dislocations sprains and strains.

D. The triangular bandage and its application.

Second Lecture.

A. The heart and blood vessels. The circulation of the blood.

B. The general direction of the main arteries indicating the points where the circulation may be arrested by digital presssure or by the application of the tourniquet, or by other means.

C. The difference between arterial, venous and capillary bleeding, and the various extemporary means of arresting it.

D. The triangular bandage and its application.

The Third Lecture.

A. A brief description of the nervous system.

B. First aid to persons suffering from shock or collapse after injury, injury to the brain, collapse from drink, epilepsy, fainting, hysteria, sunstroke, electric shock, effects of lightning, and convulsions in children.

C. First aid in cases of frost bite, burns or scalds, injury by vitriol throwing, wounds, bites of animals, stings of insects.

D. What to do when the dress catches fire.

E. The triangular bandage and its application.

Fourth Lecture.

A. A brief description of the organs and mechanism of respiration.

B. The immediate treatment of the apparently drowned, or otherwise suffocated. Artificial respiration, treatment for choking.

Fig. 4.—Ambulance Instructors. Back Row (Left to Right)—T. Pattison, Instructor; T. Pemberton, Instructor. Front Row (Left to Right)—W. Reid, District Secretary; S. A. Gidlow, General Secretary; J. H. Britton, Instructor.

C. First aid to those poisoned.

D. The immediate first aid treatment of injuries to the internal organs, and to those suffering from internal hemorrhage.

E. Foreign bodies in the eye, ear and nose.

Fifth Lecture (for Males Only).

A. Improvised methods of lifting and carrying the sick or injured.

Fig. 5.—Treating a Broken Leg.

B. Methods of lifting and carrying the sick or injured on stretchers.

C. The conveyance of such by rail or in country carts.

As soon as ever the lectures are finished the men are then taken in hand by one of the company's ambulance instructors. No man is allowed to give instruction in the practical work before he is himself fully qualified, and before any such man is fully qualified to act as instructor he must hold the certificate, voucher and medallion of the St. John Ambulance Association, and these honors can only be obtained after three years, at least, constant application to first aid work, during which time he must attend three courses of lectures and undergo three examinatios in first aid, each examination more exacting and more difficult to pass than the previous one before he obtains the coveted medallion or full qualifying badge of the Association, and one year must elapse between each first aid examination, so that it is impossible to obtain the medallion under three years.

The class then, as I said before, is taken in hand by one of the Company's instructors, whose duty it is to teach the practical work, such as the proper application of bandages and splints to various parts of the body and lifting and carrying the injured on stretchers, etc. The reader may not think the placing of a man on a stretcher of much importance, but it is really a very important part of the work, as a great deal of damage may be done in placing a man on a stretcher.

Before the instructor allows his class to go up for final examination they are expected to answer a series of test questions and to do the practical work in connection with them.

Below are a few of the questions taken from each test paper as given prior to the last examination at the Angus Works in Mantreal:

First Test.

1. What is first aid to the injured?
2. What are signs and symptoms?
3. What is the history of a case?
4. What is a fracture?
5. How many kinds of fracture are there?
6. Name the different fractures.
7. What color is arterial blood?
8. What color is venous blood?
9. Where is the brachial artery, etc.?
10. Where are the carpus bones, etc.?

Second Test.

1. What are the signs and symptoms of fracture?
2. How would you treat simple fracture?
3. What is the first thing to do in treating complicated fracture?
4. How would you distinguish fracture of the lower jaw?
5. What are the signs of dislocation?
6. How would you treat a dislocation?
7. What are the signs and treatment of fracture of the ribs?
8. What are varicose veins and how would you treat them?
9. What are the signs and treatment for internal hemorrhage?
10. What are the general rules for treatment of insensibility, etc.?

Third Test (Practical).

1. Treat this man for compound fracture of the left humerus.
2. Treat this man for hemorrhage from the left palmar arch.
3. Man is found lying on left side with knees and hips bent. There is free spurting bleeding from wound in right palm; besides the above injuries there are evidences of a ruptured spinal cord due to a fall of heavy rubbish on the patient's back. Place on stretcher, march home and put to bed.
4. This man is suffering from electric shock and wound on forehead. Place on

Fig. 6.—First Aid Work.

stretcher, march to a given point and unload.

5. A man repairing an electric cable receives a shock which causes him to lose his hold and fall from the top of the pole to the ground. He receives a compound fracture of the right leg with severe hemmorhage, fractured ribs and collar bone on left side. Treat him, place on stretcher, carry home and put to bed.

6. This man has broken his right thigh, you have only one splint. How would you treat him, etc.?

As soon as the instructor considers the class ready for examination he makes his report to the proper quarter and a medical officer of the Canadian centre of the St. John Ambulance Association is appointed to examine the class as, for obvious reasons, no lecturer is allowed to examine his own class. After the examination the men are given one hour per week in which to meet together for practice, and are by this means kept up to a proper state of efficiency, also, at stated intervals the men are inspected by a medical officer appointed by the management so that the company can find out for themselves if their men are up to the mark and able to do the work required of them.

Fig. 8.—Form to be Sent in by Ambulance Man After Attending Personal Injury.

Work of First Aid.

One thing strictly impressed on all ambulance men is, the exact relative position first aid has to the medical profession. The ambulance man is given to clearly understand that he is not expected, or in a position, to supplant the doctor, or to treat any accident to its final solution, for the simple reason, the work of the ambulance man ends where the doctor's commences, that is to say, the duty of the ambulance man is to prevent personal injury being made worse by the ignorant but sympathetic attention of his colleagues or fellow workmen. He would, if necessary, apply splints and bandages, administer simple remedies, place the sufferer in the most safe and comfortable position, and await the arrival of the doctor. In a less serious case he would give such treatment as was necessary and convey or send his patient to the doctor, and there his responsibility ends.

Every accident attended by an ambulance man is reported on a form specially provided for the purpose so that the management can see for themselves, by the manner in which the form is made out, that proper and efficient first aid is rendered, as it is also a check on the material used.

A record is kept showing the value of each "First Aider's" services to the company after he has qualified for the certificate of the association.

As an incentive to employees to obtain the certificate, the management grant certain privileges. For instance, other things being equal, the man holding a first aid certificate has preference of employment, preference for promotion and also granted an extra pass over and above the usual annual pass and on the same conditions.

Value of the Classes.

Of course, however much to be desired, it is scarcely to be expected that everyone should have the time or the inclination to join such organized bodies of "First Aiders" as the St. John Ambulance Association or the St. John Ambulance Brigade, but certainly every person should devote the time to attend at least one course of lectures, because, from the poorest laborer to the president, we are all liable to accident and all are dependent on the same first aid principles, so that it is easy to realize the risk we run, one and all, every day of our lives by reason of the general ignorance which prevails of the merest

rudiments of first aid treatment. As stated previously, every person should attend, at least, one course of first aid lectures, and then we should remove for ever those old time notions which are so hard to kill:

1st. Children after sustaining a severe blow on the head through a fall, being kept awake by their mothers for fear they should die if allowed to sleep.

2nd. Kind people forcing neat brandy down the throat of an unconscious person.

Fig. 11.—Medallion Given to Those Who, After Three Years' Work, Pass the Third Examination.

3rd. Kind people rushing about madly, and then carrying an unfortunate sufferer to the nearest doctor or hospital or else putting the patient hurriedly into a hack without any regard to the nature of the injuries sustained.

4th. Kind people picking up a person who has had his leg run over by a passing vehicle, and trying to see if he can walk, or else dragging or lifting him out of the road to the pavement apparently with the idea of making the sufferer feel more comfortable, by placing him out of the way of the vehicular traffic.

5th. Kind people standing helpless by a friend or one of their own family seeing the life blood ebbing away.

Every medical man could, from his own experience give instances where the want of a little knowledge has led to increased suffering and subsequent harm to the injured person, and even to unnecessary loss of life. Now if there is one fact more recognized than another by medical men, it is this, viz., that the

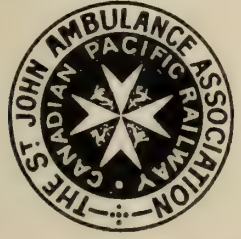

Fig. 12.—C.P.R. Ambulance Badge Worn by Men Qualified to Render First Aid.

immediate treatment adopted in the case of any severely injured person has a positive influence, and a most important bearing upon the progress of the case. The first aid treatment is given in that interval which intervenes between the occurrence of the accident and the arrival of the medical man; that anxious and trying moment (which most of us know so well) before the patient can be taken to the doctor or the doctor brought to the patient, when we feel that something should be done, and when that something is the right thing done, by one not only qualified, but who is acting under the teaching of the medical man who will subsequently attend the case, it not only aids the speedly recovery of the unfortunate person, but brings a great sense of relief to those looking on.

COACH WHEEL LATHE TEST.

A large party of railway and machinery men visited the London Machine Tool Co., Hamilton, to witness a test on a 42 inch coach wheel lathe, on Jan. 24. This machine is driven by a 40 h.p. motor, two 6 h.p. motors driving the tailstocks. During the roughing operation a speed of 22 ft. per minute was maintained.

The party visited the Berlin Machine Works, manufacturers of wood-working machinery. They were then entertained at luncheon at the Hamilton Club. In the afternoon the party visited the Canadian Westinghouse and the Hamilton Steel & Iron plants.

Among the visitors were R. Patterson, G.T.R., Stratford; Thos. Treleven, J. H. Phillips, G.T.R., London; Wm. Pitts, G.T.R., W. Petersen, C.P.R., H. Marengo, C.P.R., Montreal; W. Flynn, M.C.R., St. Thomas; C. M. Murray of Chapman Double Ball Bearing Co., M. R. Ferguson of Crucible Steel Co. (expert dept.), A. E. Juhler, G. C. Keith, editor Canadian Machinery, Toronto; W. J. Press of Mussens, C. M. Rudel of Rudel-Yeates Co., A. E. Tyler, Crucible Steel Co., Montreal; Mr. Usher, Mr. Adams and J. Christopher of T. H. & B., W. K. Pearce of Dominion Bank, W. Currie of Hamilton Steel & Iron; G. W. Robinson and D. Ryan of Berlin Machine Works; C. H. Pook and B. Elshoff of Canadian Westinghouse, Hamilton.

INTERNATIONAL STEEL CO.

A company has been incorporated under the Ontario Companies Act to manufacture high-grade steel, such as is used in making edge tools, for planes, lathes, drills, cutlery, etc., and for dental and surgical instruments, which require a very fine high-grade material. The company is known as the International Tool Steel Co., capitalized at $750,000, with its head office in the Traders Bank Bldg., Toronto. The directors of the company are John J. Main, who is vice-president and general manager of the Polson Iron Works; J. E. Murphy, lumberman; A. F. MacLaren, ex-M.P., who is also director of the Trusts and Guarantee Co., Manson Campbell, Chatham, president of the Chatham Waggon Co., and the Manson Campbell Co., and W. J. Chapman, Toronto.

The company has secured 351 acres of magnetic iron oxide sands in Quebec. It is intended to locate this plant in Welland, the ores being transported by boat.

The furnace to be used is of special design used in batteries of ten, each furnace being capable of producing 400 lbs. in ten hours. The furnace includes a combined reduction and crucible furnace with an 8-inch melting zone. It is intended that these furnaces should furnish power for forge hammers, rolls, etc.

SOCIETY NEWS.

The regular monthly meeting of the Central Railway and Engineering Club, Toronto, was held on Jan. 18, with J. Duguid in the chair. J. Bannon, chief engineer, Toronto City Hall, read a paper on Themostats and Mechanical Regulations of Heat. A feature of the evening was the presentation of a past-president's jewel to C. A. Jeffries. Friday, February 25 will be a social evening.

On January 19, the S.P.S. Engineering Society, Toronto, entertained members of the Canadian Manufacturers' Association at their twenty-first annual banquet. About 1,000 were in attendance, Louis Simpson, Ottawa, referring to electric smelting, reviewed the work of producing iron from ores and pointed out the value to Canada of this method of reduction.

Robert W. Angus, Professor of Mechanical Engineering, gave a lecture on Turbine Pumps, before the Engineers' Club, Toronto, on January 20. The lecture, which was given in the New University Hydraulic Laboratory, was illustrated by numerous lantern slides.

A Neglected Factor in Canada's Industrial Life

The Giving of Fellowships by Manufacturers to Stimulate Research Work will Assist Investigations of Principles Underlying Specific Industries in the Interests of which they are Working.

In an address delivered to the members of the Canadian Manufacturers' Association on April 25th, 1901, by Professor W. R. Lang, of the University of Toronto, on the subject of chemistry and its relation to the arts and manufactures of the country, he said:

"In discussing a subject such as you have asked me to bring before you to-night, it is only possible for me to take up the matter in a general way, more with reference to the industries of Canada, and, at the same time, to consider how best these industries may be benefited and developed by the application to them of sound, general and scientific training. Chemistry may be defined as the science which deals with the composition of matter, and, as all industries of whatever nature involve chemical processes of one kind or another, it may safely be said that no industry can succeed without chemistry."

In closing, the lecturer added:

If the various companies were to combine to establish a research laboratory, they would have to place themselves and the problems entirely in the hands of the chemist whom they appointed chief, and who might or might not be capable of bringing their research to a practical issue. Is this not a case in which it is better to invite chemists at large to take up the research? Are the chances of finding the right man for the work not enormously greater in this way than they would be in any other system of selection?

In order to carry out this idea, then, let me suggest that when difficulties occur recourse be had to those whose special training and circumstances permit of careful investigation of the subject. Where no secrecy is required and the services of the professional man consequently not called for, why not offer a prize for the satisfactory solution of the problem? At our universities there is always a sprinkling of graduates carrying on original research and who would be glad of the additional financial incentive to exercise their ingenuity and skill in clearing up the difficulty. At the same time they would be benefiting the manufacturer and indirectly the country while improving their own qualifications for an appointment in a sphere of future usefulness.

During the nine years that has elapsed since the above suggestion was thrown out practically no response has come from the manufacturers of Canada; but our neighbors to the south have acted on similar advice given by another University of Toronto man, Professor R. Kennedy Duncan of the University of Kansas, and two years ago various firms instituted fellowships in the chemical department of that University, varying in value from $500 to $1,500 per annum.

The successful candidates for these fellowships, who are all university graduates that have specialized in chemistry, hold their appointment for two years and devote themselves entirely to the study and investigation of the principles underlying the specific industry in the interests of which they are working.

Subjects Treated.

Some idea of the nature of these industries may be gathered from the following list of subjects, whose importance in the manufacturing world has prompted liberal subscriptions for the elucidation of the many problems met with in the factory:—Cements, casein, bread, laundry work, enamels, diatase, the preservation of wood, borax, boracic acid, glass—the relation between its physical properties and it chemical composition.

Each fellow must, of course, familiarize himself with the present conditions of his particular industry. He is informed as to the direction in which possible improvements may lie, and must make himself master of the rationale of each process. Then he tackles the real problems, with the knowledge of methods of investigation that his college training has given him, aided by such advice as the head of the laboratory can give him, and anything he may discover, improve on or invent he conveys to the firm whose fellowship he holds.

Professor Duncan has seen, also, that the interests of the investigation are not neglected, and the receipt of a percentage of the profits from any invention or improvement encourages the fellow to further efforts.

So far, the scheme has been highly successful, and it is safe to say that the chemist who devotes two years of his time to investigation of some industry, with the facilities that a university laboratory gives, must become a valuable asset to the firm paying the scholarship, and is more than likely to be given a responsible position in the firm's works.

To the writer's knowledge, one firm already has benefited largely from the work done by its fellow, and an almost new class of scientific manufacturers bids fair to result from the institution of these industrial fellowships.

Would it not be well for some of our Canadian manufacturers to seriously consider a similar line of action—worked out with the assistance of the heads of the chemistry department of our own universities?

SILICON AND MAGNETIC PROPERTIES.

In the Rundschau for Technologie Kolben states that pure silicon has a very high electrical resistance in comparison with metals, and approximates in this respect closely to carbon. A further point of similarity is found in the effect of warmth on the resistance, both temperature co-efficients being negative, whilst those of all metals are positive. The thermoelectric force between pure silicon and antimony is more than thrice as great as that between bismuth and antimony. The electrical resistance of iron is heightened by an addition of silicon, the maximum increase being attained in presence of 4 per cent. of silicon. At the same time, this alloy exhibits the valuable property that the resistance is practically independent on temperature, so that the alloy is excellently adapted for the construction of resistances. As regards the question of magnetic losses, so important in the construction of transformers, iron with about 3.5 per cent. of silicon gives about the same loss by hysteresis as slightly silicised iron; but the losses by vortical currents are far smaller, owing to the high electrical resistance.

LECTURES ON GRINDING.

Those interested in the subject of grinding, and living in Montreal and Toronto, will be given an opportunity of hearing two experts on this subject at the following places:—

Technical High School, Montreal, February 8th; Engineering Building, McGill University, Montreal, on Feb. 9th and 10th; at University of Toronto on Feb. 11th.

The lecturers will be C. H. Norton, of the Norton Grinding Co., and E. W. Dodge, of the Norton Co., both of Worcester, Mass.

Mr. Norton will talk on "Cylindrical Grinding," and as there is probably no man on this continent better posted on this subject, this will undoubtedly be a most interesting talk.

Mr. Norton will explain the manufacture and uses of grinding wheels; the origin and process of manufacture of the abrasive materials and various styles of machines.

These talks will be illustrated by upwards of one hundred lantern slides and cover the subject thoroughly.

The Design of Bevel Gears with Shafts at Right Angles

The Design and Manufacture of Gears, whether Spur, Bevel or Spiral, Giving Information and Tables of Great Use to Mechanical Men.

By G. D. MILLS.

In this article and the one to follow, it is the intention to introduce a method for the calculation of all bevel gears, mitre gears, bevel gears with shafts at right angles, and bevel gears with shafts at acute and obtuse angles. In part I. I shall deal with shafts at right angles, and will introduce first a table of tooth formulae, the careful

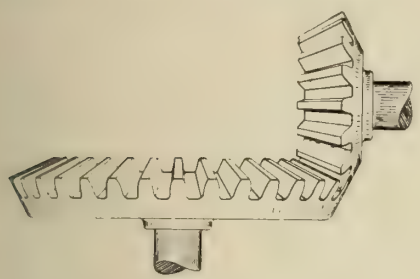

Fig. 1.—90 Degree Bevel Gear.

consideration of which enters largely into the successful design of all gears whether spur, bevel, or spiral.

TABLE OF TOOTH FORMULAS

N = number of teeth	$N = \frac{D \times 3.1416}{p}$	$N = D\,P$	
P = diametral pitch	$P = \frac{N}{D}$	$P = \frac{3.1416}{p}$	
D = pitch diameter	$D = N \div P$	$D = \frac{N}{P}$	$D = p.\,N. \times .3183$
p = circular pitch	$p = \frac{3.1416}{P}$	$p = \frac{(D \times .3183)}{N}$	
s = addendum = $\frac{1}{2}$ working depth of tooth	$s = \frac{1}{P}$	$s = .3183\ p$	$s = \frac{D}{N}$
c = clearance at bottom of tooth	$c = \frac{1}{10} \div P$	$c = \frac{.157}{P}$	$c = p \times .05$
f = full depth of tooth	$f = (2 \times s) + c$	$f = \frac{2.157}{P}$	$f = p. \times .6866$
t = width of tooth on pitch circle	$t = \frac{p}{2}$ for cut gears	$t = .44\,p$ for rough	

These formulae have been compiled from standard authorities and represent the relative proportions which exist between the diametral pitch, number of teeth, pitch diameter, circular pitch, addendum, etc., the diametral pitch being the number of teeth to each inch of pitch diameter. The pitch diameter is the diameter of the pitch circle, which is always described through the centre of the working depth of teeth. In bevel gears, it will be found on the edge line or upper slant of teeth, and on it is measured the circular pitch, or distance from the centre of one tooth, to the centre of the tooth adjoining. The addendum is equal to the addenda; and is always one-half the working depth of tooth. The diameter of blank is readily found in spur gears, by adding the working depth of tooth or twice the addendum, to the pitch diameter, but in bevel gears it must be calculated as the following diagram, Fig 2, indicates, since the calculated dimensions of teeth are on the edge line.

In the right hand corner of Fig. 2 will be found a small right triangle, which has for its hypothenuse the addendum and its corner angle is equal to the centre angle, or angle of edge. The base of this triangle is the distance which must be added to the pitch diameter on each side of the gear, in order to determine the diameter of blank, and from which is derived the formulae O_1 and O_2.

Fig 2 contains all the angles and dimensions which are necessary to properly prepare the blanks, and cut the teeth of bevel gears. If a pair of bevel gears are both of the same size they are said to be mitre gears; and the calculations of one serve for both, since the speed of the shaft is neither increased nor decreased, but simply transmitted at right angles. If, however, it is necessary to increase or decrease the speed in one of the wheels, it is evident the gears will have unequal dimensions and both wheels must be calculated. Before going into the actual operation of calculating, I shall enter into a brief explanation of the angles, etc., in Fig. 2 and the purpose they serve.

The angle included between the centre line of shaft, and a line drawn through the centre of the working depth of tooth, is the centre angle, and being first in importance its tangent may be readily determined by dividing the half pitch diameter of one gear, by the half pitch diameter of its mate, when shafts are at right angles. In the formulae which follow, however, I have substituted the number of teeth since they bear equal proportions to the pitch diameters, thus securing round numbers in calculating.

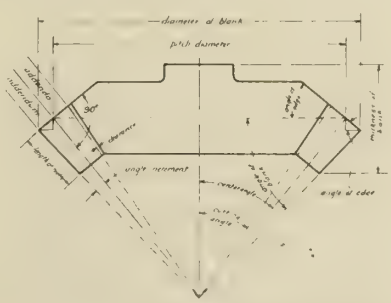

Fig. 2.—Illustrating Tooth Formulae.

The angle of edge is equal to the centre angle, since the edge line or upper slant of teeth is at right angles with centre line of teeth. The angle of small triangle in right hand corner is also equal to the angle of edge, all three being found with one operation.

The angle increment or angle of the addendum is next to be determined. Its tangent could be found by dividing the addendum by length of centre line of teeth, which length is first found by dividing the half pitch diameter of wheel by sine of centre angle. However, a shorter method is to be had in the formula tangent $A = \frac{\text{sine C}}{\frac{1}{2} N_2}$ which gives the same result. These two angles, the centre angle and the angle increment are the only angles which require calculation in bevel gears with shafts at right angles, as all the other angles are readily determined from them.

The cutting angle of gear is found by deducting the angle increment from the centre angle of gear, and the cutting angle of gear is the angle of blank of pinion, while the cutting angle of pinion is the angle of blank gear.

In the manufacture of bevel gears it is first necessary to determine the diameter and angles of blanks that they may be turned correctly, after which we are ready to cut the teeth and unless the cutting angle is correct and the machine set true we shall have half a tooth at the last cut, which is a loss of time and material. It is also important to select correct cutters, and in the list of formulae following will be found two which are prepared for this purpose.

Selection of Tooth.

In the selection of a tooth form the involute or single curve tooth is now almost universally used for bevel gears, in place of the cycloidal or double curve tooth and it may be well to also state that the number of teeth and diametral pitch or the pitch diameters, must be selected in the design of a pair of bevel gears, which selection is largely influenced by the existing conditions. In ordinary machine design the available space is a large factor from which we may determine the pitch diameters. The number of teeth in each wheel is determined by the speed ratio required. If the wheel driven is to have 3 revolutions to one of the driver, the number of teeth could be 30 and 10, 36 and 12, 24 and 8, etc. Following, are three formulae from table of tooth formulae which

aid materially in determining the number of teeth and diametral pitch:

$$N = DP \quad P = \frac{N}{D} \quad D = \frac{N}{P}.$$

Let us design a pair of bevel gears

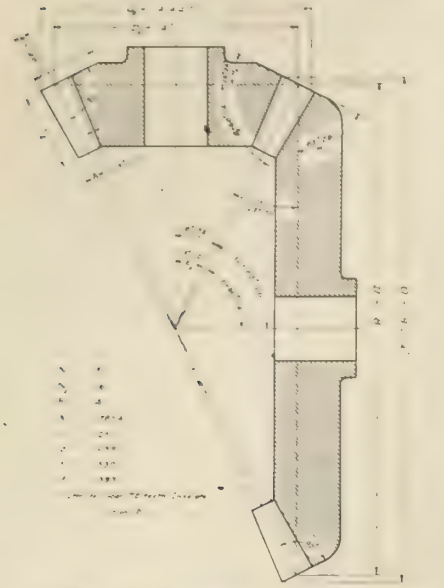

Fig. 3.—Pair of Bevel Gears, Shafts at Right Angles.

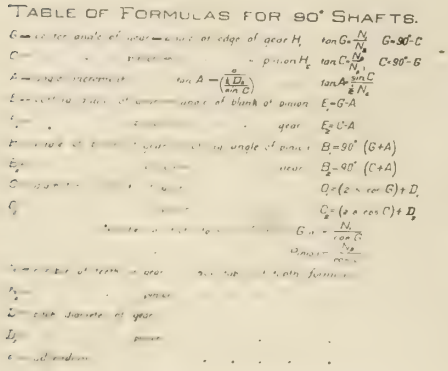
with shafts at right angles. Fig. 3 is a gear and pinion, and following are a list of formulae necessary for their calculation, the angles and dimensions are lettered for convenience.

Example.

TABLE OF FORMULAS FOR 90° SHAFTS.



In the design of a machine, we have an available space of 10 inches, and have decided to use 8 inches as the pitch diameter of gear, and as the speed ratio is to be 2 to 1 we shall select 32 and 16 teeth.

The diametral pitch may at once be determined by the tooth formula

$$P = \frac{N}{D} \text{ or } P = \frac{32}{8} = 4$$

and our pitch diameter of pinion found by the formula

$$D = \frac{N}{P} \text{ or } D = \frac{16}{4} = 4$$

inches our gears will therefore be 32 and 16th teeth, 4 pitch from which we shall proceed to calculate the balance of tooth dimensions.

The circular pitch

$$\frac{3.1416}{P} = \frac{3.1416}{4} = .7854''.$$

The addendum is readily found by the formula

$$s = \frac{1}{P} = \frac{1}{4} = .25''.$$

The width of tooth is found by the formula

$$t = \frac{p}{2} = \frac{.7854}{2} = .3927''.$$

Clearance is

$$c = \frac{t}{10} = \frac{.3927''}{10} = .039''$$

and the full depth of tooth $= (2.s) + c = (2 \times .25) + .039 = .539$ in. The foregoing will be found noted on

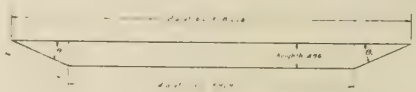


Fig. 4.—Bevel Gears, Finding the Diameters.

Fig. 3, and we shall proceed to calculate the angles.

The tangent of centre angle of gear

$$\text{or tangent } G. = \frac{N_1}{N_2} = \frac{32}{16} = 2.$$

and its angle is 63°—26¹.=H_1 the centre angle of pinion or C=90°—G=90°—63° —26¹=26°—34¹=H_2. The tangent of the angle increment is found by the formula

$$\text{tangent } A = \frac{\text{sine } c}{\frac{1}{2} N_2} = \frac{.4472}{8} = .0559$$

and its angle is 3°—12¹. The cutting angle of gear which is the angle of blank of pinion is found by deducting the angle increment from centre angle of gear or E_1=G—A=63°—26¹—3°—12¹ =60°—14¹=B_2. The cutting angle of pinion which is the ang'e of blank of gear is found in the same way or E_2=C —A=26°—34¹—3°—12¹=23° — 22¹ = B_1. These angles will be found noted in their proper place on Fig. 3.

We have yet to determine the diameter of blanks and size cutters to use, as these formulae are calculated with cosine G and cosine C. We have been obliged to leave them until the angles were calculated. The diameter of blank of gear will be found by the formula O_1 =(2.s cos G)+D_1=(2×.25''×.4472) + 8''=8.224 in., and the diameter of blank of pinion O_2=(2.s. cos C) +D_2= (2× .25×.8944'') + 4''=4.447 inches. With respect to the cutters, the number of teeth to select cutter for gear

$$\frac{N_1}{\text{Cos. G}} = \frac{32}{.4472} = 18 \text{ teeth}$$

or an involute 4-pitch bevel gear cutter, which will cut 72 teeth, and the number of teeth to select cutter for pinion

$$\frac{N_2}{\text{Cos. C}} = \frac{16}{.8944} = 18 \text{ teeth}$$

or on involute 4 pitch bevel gear cutter which will cut 18 teeth. It is evident that two cutters will be required to cut these wheels, as gear cutters are usually arranged in sizes, and each size has a certain range of teeth to cover. The calculated numbers of teeth, are the numbers of teeth of an equivalent spur gear and pinion having the same profile. One cutter will often do for both wheels, but the formulae readily determine this. These quantities have been noted on Fig. 3, which practically completes the calculations. The size of hub will, of course, be goverened by the diameter of shaft it is to be fastened to, and the length of teeth is largely influenced by the power on shaft and particular purpose of the gears.

Machining Blanks.

If we are to have correct, smooth, and easy running gears, we must provide correctly turned blanks. A method to facilitate the turning of blanks, may be briefly described as follows. After the disc is turned to conform to the diameter of blank, we are ready to turn the lower slant or face of teeth. In order to determine how much metal to remove, we must define the end of teetb on bottom of disc by a circle, which can be scribed by the compasses, and its diameter found as in the following diagram Fig. 4.

The diameter of circle should be calculated to insure greater accuracy, also the height; if we decide to make length of teeth 1¼ inches, the diameter of scribed circle=O_1—(2.¼'' cos B_1)=8.224'' —(2×1¼''×.918)=5.929 inches and our height=1¼'' sin B_1=1¼''×.3966 =.496 inches. This distance should be laid off on the side of disc from bottom and a line scribed all around the blank to define it, and after the circle is scribed on the bottom we have two lines to turn to. This operation completed we are ready to try the angle with a protractor, which is illustrated in Fig. 5.

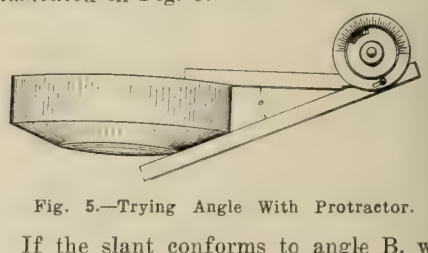

Fig. 5.—Trying Angle With Protractor.

If the slant conforms to angle B, we may proceed to cut the edge line or top slant of teeth, and shall have a similar diagram to the one before (Fig. 4) except it is reversed. The angle of top slant is the angle of edge H_1, or centre

angle, and the length of edge line is the full depth of tooth .539 inches plus sufficient margin to insure proper strength to the wheel. We shall call the full length of edge line, one inch in this case, and calculate diameter of top circle to turn to, which equals O_1—(2×1×ccs H_1) =8.224''—(2×1×.4472) = 7.33 inches, and our height is 1''×sin H_1=1''× .894=.894 inch. After the operation of turning the edge line is completed, we are ready to try the angle with a protractor, which is illustrated in Fig. 6.

This slant should conform to the angle of edge or angle H_1, after which we are ready to cut the teeth. This operation may be performed with an automatic gear cutter, or a milling machine. The cutting angles as calculated are correct for both machines. We have, however, neglected to properly proportion our disc, which is the starting point of our

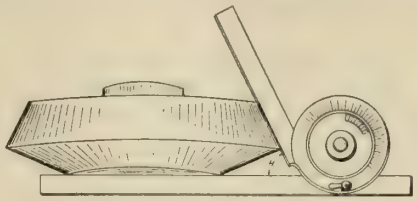

Fig. 6.—Trying Angle With Protractor.

turning operations. These preceding calculations are necessary to determine its thickness, which is the sum of the two heights, as calculated, .496''+.894'' =1.39 inches for the gear, providing the wheel is to have no hub. If a hub is required, we must add its height to 1.39 inches. The diameter of disc is the diameter of blank 8.224 inches. These turning operations may be reversed, and the top slant turned first, if such a course seems desirable, also the included angle of the finished blank is readily found by adding together angles H and B.

In article 2, which is to follow, will be described a method for the calculation of all bevel gears other than those with shafts at right angles, or bevel gears with shafts of acute and obtuse angles.

A Great Saving Effected by the Use of the Disc Grinder

Figures Given Herewith by the Gardner Machine Co., Beloit, Wis., Show Great Savings in the Auto, Marine and Stationary Motor Industry

The Disc Grinder has found an increased usefulness in the auto, marine and stationary motor industry, whereby the time of accomplishing certain work has been considerably reduced. In most work the grinder is used in conjunction with a planer, shaper or lathe, but the time given for the parts mentioned in this article is for grinding alone, the parts being finished on a No. 6 Gardner Grinder.

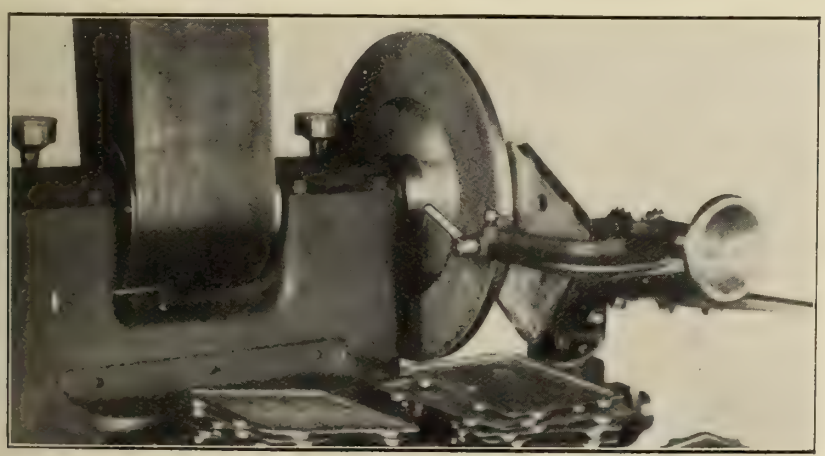

Fig. 1.—Grinding Jacket Plates, Showing Special Jig.

Fig. 1 shows a jacket plate being ground. Each piece was finished in 2½ minutes. A special jig was used to hold the jacket-plate during the operation. Fig. 1 gives an idea of the belt power and the heavy type grinder, equipped with 23-inch disc wheels and lever feed table.

Fig 2 shows the arrangement for grinding cylinder covers, which required only 1¼ minutes each. Fig. 3 shows the grinder equipped for exhaust connections, which were ground at the rate of 3 minutes each.

Fig. 2.—Grinding Cylinder Covers.

Fig. 3.—Grinding Exhaust Connections.

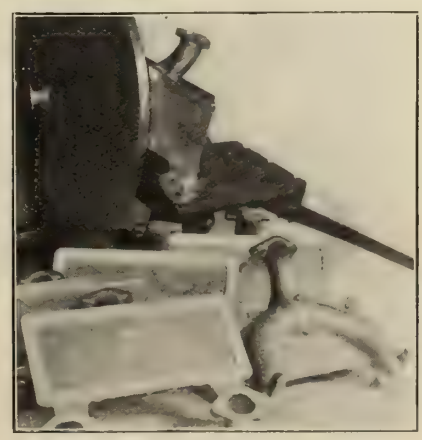

Fig. 4.—Grinding Intake Manifolds.

Fig 4 shows the grinding of intake manifolds at the rate of 3½ minutes each. This time includes grinding the large area and the single flange at a given angle, completing it in the time mentioned.

The grinding of pump-cases is shown in Fig. 5. The time required is 2 minutes each, which includes grinding large area and the bracket area parallel.

The pieces shown in Fig. 6 are universal joints. The grinding operation takes

Fig. 5.—Grinding Pump Cases.

1½ minutes each. These pieces are malleable iron castings, about 6 inches in diameter.

In addition to the operations mentioned there are a great many more in the engine factory to which a modern disc grinder is adapted, flange seats, push rods, cams, piston rings, thrust collars, crank cases, gear cases, manifolds, couplings, etc. The adoption of the grinder has assisted in producing a greater output with an equal or superior finish.

F. W. Cowie is giving a course of lectures at McGill University on Har-

Fig. 6.—Grinding Universal Joints.

bor Engineering. The course includes instruction in the building of docks and wharves, the preparation of approaches, and all the general features of port development.

Electric Lifting Magnet Now in Use in Canada

Magnets are Now Used in the Canadian Locomotive Works, Kingston, and in the Angus Shops, Montreal—Used for Lifting Plates, Pig, Iron, Scrap, etc.

The magnet that boys of yesterday used for a toy to-day as men they are employing as a useful instrument in their workshops. Within the last few years particularly, it is being adapted to handle many shapes of metal, all forms of iron and steel, from iron dust to scraps, or small junk to weights of 20,000 pounds. In fact, the world's largest magnet will lift as much as 50,000 pounds.

Fig. 1.—Front View.

Fig. 2.—Side View.

The magnet is employed to break up imperfect castings, to hold sheets of metal in position while they are being riveted in the building of ships, to lift a "sow and pigs" at the furnaces, also as a gigantic broom to sweep both the large and small pieces of iron, and in numerous other ways.

The flat style of magnet is available for picking up metal sheets, from two to six at a time, one under the other, the number depending upon their thickness. These may be dropped by the magnet one at a time at the desire of the operator provided he is clever in adjusting the switch at precisely the right intervals.

Canadian Locomotive Works.

Probably the first instalation made in Canada was that at the Canadian Locomotive Works, Kingston, where a maget was delivered by the Browning Engineering Co., Cleveland, on March 13, 1908.

This instalation includes a standard No. 8, Browning Locomotive Crane, which is designed to carry a 7½ or 10

Fig. 3.—Magnet Handling Machine Scrap.

h.p. steam generating set to operate our lift magnets. For this purpose it is equipped with extra large boiler, 54 in. diamter and 8 foot 6 inches high, with corresponding increase in water

and coal capacity. Coalbunker holds 1 ton of coal. Watertank holds 300 gallons, and engines have 8 by 10 inch cylinders.

Fig. 1 shows a front view of the magnet beside a new C. N. R. locomotive which is being tested. Fig. 2 shows a side view of the crane. When used on a locomotive crane the current for operating the magnet may be brought from an outside source, using flexible cable or other convenient means to connect to the magnet controller, so as to allow the crane to perform all its functions freely, or it may be generated on the crane itself by a steam driven generator set.

Angus Shops Instalation.

An instalation of an electro-magnet and crane was made at the Angus Shops, Montreal, early in 1909, many uses being there found for it, loading scrap, unloading pig iron, etc. It also was made by the Browning Engineering Co., Cleveland. It is found to do the work cheaply and efficiently. Fig. 3 shows the electro-magnet handling scrap.

Description of Magnet.

The frame of the magnet is of open hearth steel of special analysis and treatment suitable for electric magnet use. The top of the frame is deeply corrugated to provide radiating surface. The outer ring and inner pole are made of the same special steel as the frame, and are so designed as to be easily and cheaply replaced when worn. The inner faces of the magnet frame and ring are machined to exact dimensions so that the coils fit closely, and the heat generated in the coil is quickly transmitted to the metal on every side.

The coils are wound with copper wire which is covered with special fire-proof non-absorbent insulating material The coil is a homogeneous cushion having the requisite number of turns of wire imbedded in it at uniform spaces from each other. The coils are made of such size as to completely fill the space in the frame and when the several parts of the magnet are bolted together are tightly clamped in place.

Two coils are used in standard magnets which are connected in series for 220 volt circuit, but which may be connected in parallel and used on circuits of 110 volts. For 500 or 550 volts special coils are furnished.

HOW BILLY CENTRED SHAFTS.

Mr. William Collis, affectionately known amongst the boys as "Billy," was the foreman of the turning shop some twenty years or so ago. He was a working foreman too—not one of the kind who was afraid to dirty his hands—and to fill in his time between Monday morning and Saturday noon, when he was not giving out work or looking after his men he ran the shafting lathe—or rather the shafting lathe ran itself even when he was looking after the men, or when he was dozing on the top of his tool-chest, for in that shop there was no tool-room and each man kept his own special fancies in the way of

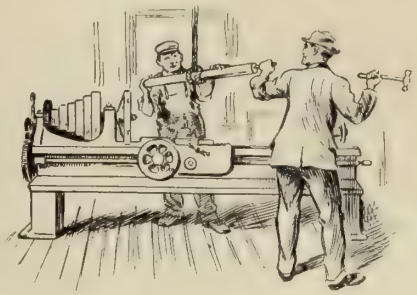

Fig. 1.—"Now Billy's Method of Centering Shafts was Primitive."

tools, etc., under lock and key. High-speed steel was in the dim and distant future, and a cut over a shaft lasted a long time.

Now Billy's method of centreing was as primitive as could be, the usual tools consisting of a centre punch and hammer only. A square centre was used sometimes, but this gave trouble in changing centres, putting something in the tool-post to press the shaft, and other little worries which could be avoided ; therefore, by placing the centre punch where he guessed the centre of the shaft should be, and hitting it several good smart blows the thing was done—except, of course, when he had miscalculated as to the exact position of the centre. It was then necessary to try the shaft in the lathe, and if too much eccentricity was found he would mark the "high side" with chalk, remove the shaft and "draw" the centre by means of the punch, the shaft being swung in and out of the lathe by means of pulley blocks.

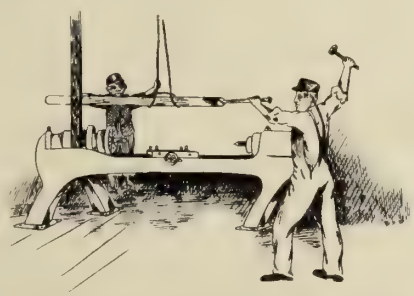

Fig. 2.—"Our Regret is that we Don't Know the Tool-Smith who Forged that Centre-Punch and the Concern that Made the Hammer."

His assistant on the operation was generally one of the newer lads knocking around, and for the particular shaft in the story the services of Harry had been secured. Now Harry's sense of humor (?) was strongly developed, and he hated this particular job just as much as he was afraid of Billy, but his love of a joke overcame his fears one day, and here is the story as told in Machinery :

Billy had made a particularly bad guess as to the position of the centre of the shaft and had followed his usual practice up to the point of swinging the shaft out of the lathe, when he was called away to attend to some other duty. As Harry lolled around waiting for the work to proceed again, the little chalk mark persistently stared him in the face in such a manner that finally an idea struck him, that it would be funny if he rubbed it out and placed another on the opposite side. Of course, as in most things of importance, the main thing was to have the idea, the rest was easy and was soon accomplished. It was too good a joke to be enjoyed alone and several others soon knew what had been done, amongst them being one of Billy's own particular cronies. Billy returned soon afterwards, and resuming operations, drew the centre towards the mark. His surprise was very pronounced when he saw the result of his latest efforts and the remarks he made about shafts in general and this one in particular are unprintable, but he fairly lost his temper when caught sight of someone smiling, apparently at him.

Poor Harry wanted to laugh, too, but dared not, so offered what consolation he thought would meet the case, suggesting that Billy had perhaps made a mistake, and should have drawn the centre away from the mark, but Billy said he might do that when he started his second appreticeship and knew no better. From his manner towards his assistant the next day it was clear he had learned over night what had occurred, but he was not vindictive, and afterward enjoyed the joke as much as anyone.

How Billy Didn't Centre Shafts.

This startling sketch, Fig. 2, illustrates an amateur artist's weird conception of a shafting lathe and a machinist's way of handling centreing tools. He was asked to make a drawing for "How Billy Centred Shafts" and the result exceeded our wildest expectations. We are impressed particularly with the lathe legs. How well they don't harmonize with modern ideas of machine design ; they appear to us to belong to the Elldog type of architecture ! Note the "patent" head-stock and the "unpatent" foot-stock, and the doleful expression of the cub, who can't for his life see how to swing an eight-foot shaft between five-foot centres. The carriage is a gem—but why proceed further ? The makers are unknown and we don't care. Our regret is that we don't know the toolsmith who forged that centre-punch and the concern that made the hammer.

An Effecting of Savings by Studying Steel Heating Costs

A Review of the Most Economical Methods for Heating Steel in the Manufacturer's Plant, Giving Tables of Costs of Various Systems

By W. ALMON HARE, B. A. Sc.

Producer Gas.

Producer gas from soft coal finds its special field in regenerative furnaces for re-heating billets and slabs for the finishing mills and for the soaking pits of the blooming mill.

Although some installations have been made in which a number of different sizes of small furnaces have to be heated, the system has many drawbacks and in such instances has no advantages over direct fired coal, either on the ground of economy or output.

To those who consider the matter impartially, this conclusion is at once seen to be correct. In the first place with the bituminous coal producer, the same fuel is burned as is required when the furnaces are fired direct by mechanical stokers. It is evident that whatever losses occur in the producer are entirely lost by the system and that the gases arriving at the furnaces are poorer by this amount. In the case of direct firing by mechanical means the heat units in the coal are all liberated in the fire box of the furnace.

From a theoretical standpoint the losses in the furnace itself arising from radiation, stack gases, chemical reactions, etc, represent an enormous proportion of the heat units delivered in the coal, but these losses do not differ very much if at all with the different methods of heating, and within certain limitations, cannot be very much reduced. The losses which occur in the producer are very much greater than those occurring in the fire box—and in this way the ultimate economy will be higher with direct fired coal than with gas producers.

Prof. J. W. Richards, of Lehigh University, has made a very extended investigation into the bituminous coal gas producer, and in a paper written by him on the subject gives the following as the losses which take place.

	B.t.u.	P.C.
Lost by carbon in ash	284.05	2.17
Lost by Radiation and Conduction	659.81	5.07
Lost by Sensible Heat in Hot Gases and Steam	1,866.73	14.35
Total Heat Lost in Producer	2,810.59	21.59
Calorific Value of Gas Produced	10,189.41	78.41
Calorific Value of one lb. of Coal	13,000.00	100.00

By the above it will be seen that there is a direct loss of 21.6 per cent. in the producer itself, and this loss cannot by any present means be prevented, hence the coal consumption per ton of steel will be 27.5 per cent. higher than with direct mechanical firing.

In large plants this loss is partly overcome by the use of regenerative chambers for heating the air and by the greater distribution of the flame, but in moderate sized furnaces these features offer nothing to offset the loss of heat in the producer itself, and as a result much better economy can be secured by firing the coal direct, and especially if automatic stokers are used.

In large plants, where one or two producers are supplying gas to a number of furnaces, fairly good results can be obtained with all furnaces in operation, but in times of depression when some of the furnaces are out of commission, the coal consumption per ton of steel heated on the remaining furnaces is much increased, and when the amount of gas reqired is very much below the capacity of the producers, the coal consumption is prohibitive. It will be noticed that this increase in coal consumption takes place at times when the management are most desirous of reducing operating costs, and therefore this system is very disadvantageous on that account.

Anthracite Coal.

This fuel possesses one advantage in that it is smokeless and also in the fact that the design of the furnaces does not involve anything very difficult, but apart from these points there is nothing to commend it, for at the prices now being paid for hard coal, the cost of operation is very high. Usually the type of furnace adopted for this fuel would consist of a flat grate with a closed ash pit, bricked up at the sides, and with a roof sprung across. The steel bars to be heated are laid on the fire and are heated in this way. The coal burned per ton of steel varies very much in different plants, principally due to the nature of the work in hand and the output of the furnace. It is not unusual to find a coal consumption of 600 to 800 lbs. per ton of steel which with coal costing $5 per ton, means a fuel cost per ton of steel of from $1.50 to $2.

With furnaces burning soft slack coal and mechanically fired, very much lower costs are obtained, as will be seen from the figures given below.

Tests of a track bolt furnace burning bituminous slack coal, and fired automatically by an American mechanical stoker.

	No. 1	No. 2	No. 3
Total weight of steel heated, lbs.	7,500	8,000	10,200
Total weight of coal burned, lbs.	1.445	1,590	1,875
Pounds of coal per ton of steel heated, lbs.	386	398	370
Cost of slack coal per ton	$3.60	3.60	3.60
Fuel cost per ton of steel	$0.69	0.72	0.67
Average of three days run		$0.69	

The hard coal furnaces operating in the above plant will not average better than 700 lbs. of coal per ton of steel, and with hard coal at $5 per ton, fuel cost per ton of steel would be $1.75. The saving due to the change is, therefore, $1.06 per ton of steel or 60 per cent. In addition to the reduction of cost, the output has been very much increased as the operator does not have to wait for the steel to heat up, and with the stoker the fire can be forced if desired.

Crude or Fuel Oil.

Much has been said or written regarding the advantages of liquid fuel, but after all the final test is cost of heating a ton of steel and while it is quite true that fuel oil will show a considerable reduction in cost over other fuels in some instances, it cannot be said that this is to be taken as being true for all classes of heating.

It is not to be denied that for certain operations in railroad or other shops where it is necessary to carry the heat to the work, that the portable oil furnaces is by a long way the most desirable, but in these cases, the actual cost of the fuel is completely overshadowed by other practical considerations. For such work as tool tempering, especially in very small furnaces, no fuel, unless it be gas, can be used with the same cleanliness and complete control as fuel oil, but where a large output is required

In the Nov. 1909 issue, Mr. Hare gave tables of the various systems and fuels. Tables of costs were also given comparing the cost of heating steel by stoker fired coal furnaces and natural gas furnaces.

In an early issue Mr. Jacobs of the Francis Hyde Co., Montreal, will give an article with tests on steel heating and will discuss costs of operating.

aggregating over 1,000 lbs. of steel per day, a properly designed slack coal furnace mechanically fired will show much lower costs of operation.

The reason for this is due entirely to the high cost of the oil, for in the distribution of the heat units in the furnace

Carriage Axle Furnace

and the efficiency of the furnace itself apart from the source of heat, oil or gas will operate the furnace more economically than by any solid fuel. By this is meant that, owing to the less volume of air passing through the furnace and consequently the nearer approach to exact theoretical requirements, the higher the furnace temperature will be for the same number of British thermal units liberated, and as a further result, less waste will be passing up the stack. Notwithstanding this advantage, the final result of a trial between oil and soft slack coal, stoker fired, is very much in favor of the coal. Taken on a basis of B.t.u. purchasable for $1, the difference is considerable. Soft slack coal having the following analysis can be purchased for $3 a ton (2,000 lbs.) and is known as Pittsburg gas slack:

Carbon	62.64 p.c.
Volatile Matter	31.09 p.c.
Ash	6.41 p.c.
	100.14 p.c.
Sulphur	1.00 p.c.
Calorific value	14,468 B.t.u.

One dollar's worth of this coal will when burned, generate 9,650,156 B.t.u. One dollar's worth of oil at 4 cents per Imperial gallon, will generate 3,950,000 B.t.u., taking the sp. gr. at .79, and the calorific value at 20,000 B.t.u. per lb. The ratio, therefore, of coal to oil in heat units for the same cost is as 2.42 to 1.

In the test given below it will be noticed that the coal furnace burning slack at $3 per ton, heated 1,274 lbs. of steel for one dollar, while the oil furnace burning oil at 4½c per Imperial gallon, heated 579 lbs. for the same cost, or in the ratio of 2.2 to 1.

In both tests the economy was very poor, but they are both from the same furnace, being taken before and after a change of fuels.

Test of a nut furnace fired by oil and afterwards changed to stoker firing, burning soft slack coal:

Nut Furnace	Coal	Oil
Output per day of nuts, lbs.	2,460	2,316
Output per day of nuts, tons	1.23	1.156
Inc. of coal fnce over oil, lbs.	144	
Inc. of coal fnce over oil, p.c.	6.3	
Cost of fuel per ton or per gal.	$3.00	$0.045
Quantity of fuel burned per day lbs. and gals.	1,333	90
Cost of fuel per day	$2.00	$4.05
Fuel burned per ton of steel heated, lbs. or gallons	1,093	77.8
Cost of fuel burned per ton of steel heated	$1.57	$3.49
Labor for handling coal and ashes, one man for 4 furnaces at $1.40 per day, cost per day per furnace	$0.35	
Total cost labor and fuel per day	$2.35	4.05
Additional fixed charges on stoker furnace in interest and depreciation per day	0.18	
Total cost of fuel, labor and fixed charges per day	$2.53	$4.05
Total ditto per ton of output	$2.05	$3.50
Relative cost of coal and oil	58 p.c.	100 p.c.
Saving per annum of 300 days in favor of the stoker fnce.	$456.00	
Weight of steel heated for one dollar, fuel only, lbs.	1,274	579
Ratio of coal and oil in output at same cost	220	100

In a recent test, conducted in one of the largest plants in Pennsylvania, a coal furnace fitted with a No. 5 stoker, averaged during 3 days a daily output of 11,400 lbs. of steel with a coal consumption of 288 lbs. of slack coal per ton of steel. This coal would cost in that location about $1.50 per ton. With fuel oil at 3½ cents per gallon, an oil furnace would have to heat one ton of steel with a consumption of 6.1 gallons, in order to show the same fuel cost per ton as with coal, i.e. 21.6 cents.

In Ontario, where the coal will cost $2.75 per ton, and the oil 4½ cents a gallon, the oil consumption per ton of steel would have to be as low as 8.8 gallons in order to equal the fuel cost with coal, or 39.6 cents per ton of steel

Taking everything into consideration, the oil system has a number of advantages over coal, such as the ability to get up the heat without extra labor, no handling of coal and ashes, etc., but when this is all considered, and everything accounted for, the cost of heating large quantities of steel will be higher than with a properly proportioned coal furnace, fired automatically by a mechanical stoker.

Bituminous Stoker Furnaces.

The reverberatory furnace fired by hand with lump coal is perhaps one of the most popular type of furnace in use to-day, especially in the larger units, such as are used for billets, axles, slabs, etc. It possesses the advantage of being self-contained and not dependent on the operation of any other part of the plant, with the exception of the forced blast blower, and unlike the gas fired furnaces the economy is not influenced by the number of furnaces in operation.

By hand firing, however, the best result is not obtained from the coal, though it was only within the last few years that furnaces of this type could be automatically fired by mechanical stokers, as it required a great deal of experimenting to determine the best proportions of the furnace when stokers were installed. Previous to ascertaining the correct data for building stoker fired furnaces, many failures resulted,

due to inability to distribute the heat where required. Happily a considerable advance has been made recently, and a great deal of accurate data secured, which places the problem within the field of easy solution.

The results obtained by the application of stokers to furnaces of this type are summed up under the following heads:

Steady uniform heat, resulting from continuous firing.

Increased output, as less time is lost between heats, and as the furnace can be forced.

Lower grades of fuel possible, as slack coal is burned instead of lump, and at a proportionately lower cost per ton.

Smokeless combustion and clear flame, thus reducing the proportion of carbon monoxide escaping up the stack.

A reduction of labor where a number of furnaces can be attended to by one fireman, as the stokers are operated automatically.

Easy regulation of the character of the flame, owing to independent control over both coal and air supply.

Reduction in amount of slag or scale, due to non-oxidizing nature of the flame.

In a test of a furnace fitted with mechanical stokers in comparison with one of practically the same general dimensions, and fired by hand, resulting in the following figures:

	Hand	Stoker
Date of test	Sept. 29, '08	Sept. 29, '08
Duration of test, hours	23.75	23.00
Furnace number	2	1
Method of Firing	Hand	Stoker
Make of stoker "American" Mechanical		
Size of stoker	No. 9	Type M
Total weight of coal used, lbs.	9,880	9,720
Total weight of steel heated, lbs.	50,010	58,140
Steel heated per pound of coal	5.065	5.93
Pounds of coal per ton of steel heated	394.8	337.2
Saving of coal per ton of steel heated, lbs.		57.8
Saving of coal per ton of steel heated, p.c.		14.33
Total weight of scale, lbs.	1,447	1,435
Pounds of scale per ton of steel, lbs.	58	49.5
Reduction in scale in favor of stoker, p.c.		14.7
Total ash, p.c.	2,277	815
Per cent. ash	23	8.38
Total tons of steel per year	5,800	7,000
Total tons of coal per year	1,117.5	1,170
Inc. output of stoker fnce., p.c.		20.7
Increased economy of stoker fnce. p.c.		14.33
Cost per ton of steel on basis of $3.00 coal	$0.59	$0.50

In the above instalation the application of the stokers resulted in an increase of output of 20.7 per cent., and a reduction of fuel cost per ton of output of 14.33 per cent. In addition to these savings, the stoker furnace was paying less for its coal, which resulted in a still greater financial return than the above figures indicate.

If the above test had been conducted in Canada, where in some parts, principally in Ontario, a difference between the cost of lump coal and slack amounts to nearly $1 per ton, the saving from the use of the stoker would have been very considerable, amounting to about $5 per day, or $1,500 per year, thus returning the entire investment in a few months operation.

The following test was made on a Guide mill furnace, after fitting same with two mechanical stokers:

	Data
Type of furnace—Guide mill, reverberatory,	
Length of hearth ..... ft.	16'—0"
Width of hearth ..... ft.	6'—2"
Grade of "coal"—West Virginia Nut	
Number of stokers	2
Type and make of stokers—"American" Mechanical .... No.	9, Type M
Time of run 5 turns of 11 hrs each, hrs.	55
Total weight of steel charged per heat, lbs.	8,200
Total weight of finished steel ... lbs.	206,298
Total weight of coal burned ... lbs.	29,272
Coal burned per ton of steel heated, lbs.	284
Fuel cost per ton of steel heated @ $3.00 per ton .... $	0.426

Axle Furnace, with Stoker.

The economy shown in this test is very much better than that obtained ers, and at which time the furnace was hand fired.

Saving Waste Heat.

In connection with the coal fired steel heating furnaces there can be installed small watertube boilers, which will extract fully 60 per cent. to 70 per cent. of the heat units remaining in the stack gases, and it is shown by the results of many instalations of this kind, that the steam so generated will be sufficient to supply all the necessary power for the operation of the forging machinery, and perhaps in some larger instalations, leave a margin for other purposes.

In this way, in a properly designed plant, where furnaces, boilers, engines, etc., have been carefully laid out as a whole, it is possible to operate the plant with no further expenditure for fuel or other power than the soft slack coal necessary for the furnaces alone.

It must not be assumed that this happy result can be arrived at by purchasing equipment at random, for there are certain conditions that must be met, which can only be successfully surmounted by proportioning the different units to one another.

Several U. S. railways are experimenting with mechanical stokers for locomotives. In very few cases have accurate tests been taken, and those that have show results unfavorable to the stoker. Where the firing is well within the capacity of one man without mechanical aid there does not appear to be much reason for installing mechanical stokers, although in America it is hoped that they will help to abate the black smoke nuisance.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

MAKING SHOP BRIGHTER.

In one of the machine shops of the Canadian Locomotive Works, Kingston, experiments have been made in the

Fig. 1.—Making the Shop Brighter.

painting of the machines which resulted in a considerable brightening of this shop. Fig. 1 shows a planer and Fig. 2 a slotter. These give an idea of the appearance of the machines when painted white.

Ordinary paint cannot be used as the

Fig. 2.—Making a Shop Brighter.

oil used to lubricate the machine, will in time dissolve the paint so that the machine would soon be left in the same condition as before without producing any increased light in the shop. The machines shown and the others in the shop are enamelled. It is an expensive operation but it gives excellent results. Besides, the workmen can easily clean their machines without fear of removing the paint. In Fig. 2 the contrast between the white and dark machines may be seen, the one at the left not being enamelled.

TO PUT ON DRIVE BELT.

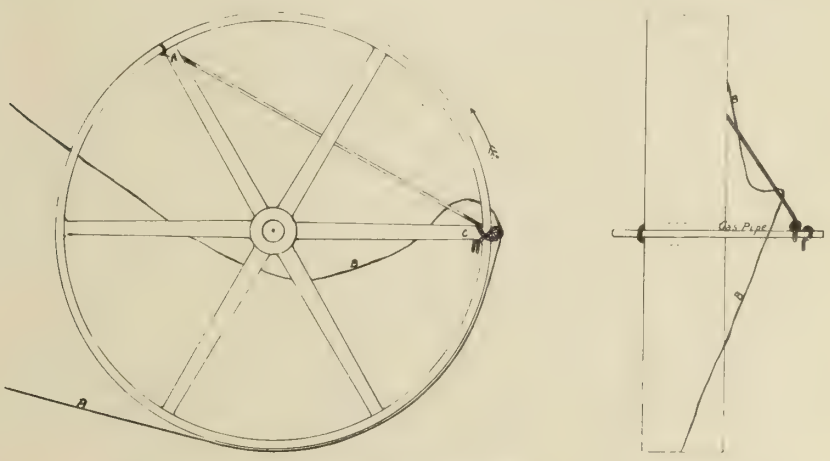
By Frank E. Booth.

As is well known, a large belt is usually put in its place by tieing it to the drive wheel rim and turning engine over.

The objection to this method is that the belt gets twisted and crumpled very often, which might shorten its life of service.

While instaling an engine in an electric power house up the country, the writer saw the engineer work a first-class scheme for putting on a large drive belt, which is illustrated by the accompanying sketch.

A piece of wrought iron pipe was placed across the face of the wheel, as shown, being tied with a piece of rope to the wheel arm C, at one end, while a longer rope was run to the arm, A,



To Put on Drive Belt.

from the other end. The belt had approximately the location, as shown by heavy line B, when the engine was turned over; the long rope being underneath belt. The belt will slide on quite smoothly when the wheel is moved in the direction shown by arrow.

MACHINING LARGE GEARS.

The William Hamilton Co., Peterboro, had to machine two large gear wheels of large size. The pitch diameter was 66¼ inches and each gear was 11 inch face with 52 teeth of 1 inch pitch. These

Machining Two Large Gears.

were for driving pump for the Peterboro water supply.

In order that they should be exactly the same they were fastened together in the manner shown. The gears were then treated as one gear with a 22 inch face and the machining was proceeded with in the regular way.

WROUGHT IRON AND STEEL.

A writer in the Brass World gives the following formula for a solution for making an acid test to distinguish wrought iron from steel: water, 9 parts; sulphuric acid, 3 parts; muriatic acid, 1 part. These acids are poured into the

water and allowed to cool in a glass or porcelain dish. The test is made by immersing the samples in the solution for 15 or 20 minutes. After being rinsed and dried, the specimens, if iron, will show a series of fibres, with the slag interspersed between the fibres. Soft steel dissolves uniformly and without the fibrous structure found in wrought iron.

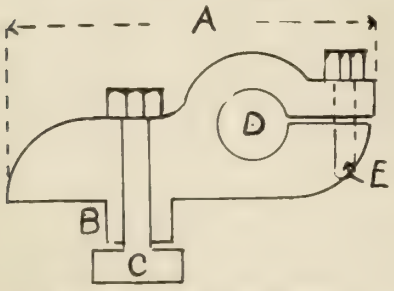
Commenting on this kind of a test, T. N. Thomson, principal of the School of Sanitary Engineering at the International Correspondence Schools, Scranton, Pa., says this shows that the corrosion of steel is different from the corrosion of wrought iron, the steel being uniform and smooth as compared with the jagged, fibrous character of the wrought iron corrosion. It also shows the reason why a piece of steel pipe should last longer than a piece of wrought iron pipe. The difference, however, in favor of the steel—as far as corrosion by that process was concerned—was so slight that good steel pipe can be considered to be at least equal to modern wrought-iron pipe in durability.

BORING BAR HOLDER.

By F. A. Rodgers.

I have a boring bar holder that will perhaps be of good service to some one. Herewith is a sketch illustrating it. The length A should be the length of top of compound rest. The bottom should be planed and lug B fitted to T-slot on top of compound rest; C is a T-headed bolt which fastens same. D is hole for bar and should be carefully laid out as the centre of the bar must be in line with the lathe centres. I 15-16 is what I use. E is a cap screw which clamps the bar.

For boring small holes bars can be turned down to any size desired or bushings may be used. This holder grips



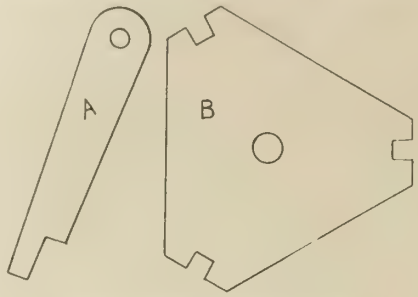
End View, Boring Bar Holder

very fast and gives the bar a solid support. There is only one nut to tighten and no clamps or packing blocks are required.

VALVE GRINDING MACHINE.

In grinding valves and valve seats, great care must be taken to have the two parts fit closely together thus completely eliminating any chance of steam leakage. By a simple contrivance at the Canadian Locomotive Works, Kingston, this is accomplished, a jig to hold the valve port being constructed, and driven by an ordinary compsessed air motor. Both parts fit perfectly after the valve and seats are thus ground to fit.

The jig consists of three arms attached by bolts to a centre pin. The shape



Valve Grinding Machine Parts.

of the arm is shown at A in the illustration. These three arms grip the seat. Underneath the arms is a triangular plate, B, having three slots in which the three arms rest. A nut on the centre pin squeezes the triangular plate up, thus holding the valve part tight while the grinding operation is removed.

FACTORY MESSANGER SERVICE.

By D. A. McLean *

Considerable annoyance and delay has been experienced by manufacturing concerns in transmitting messages from one department to another, and as these are of an important nature care must be taken that they do not become lost or buried on some busy desk where they do not belong. The envelope system is probably the best in use to-day, a copy of which is shown on this page and the instructions at the top show for what it is intended.

The envelope may be of any size desired, but about 6" x 8" is a convenient size. The paper should be of good quality and the best suited for erasing.

In each department where messages are delivered and received boxes or baskets are placed marked "inward" and "outward." The messenger arranges a time table which is posted in each department showing the time he will call at that station.

In directing your envelope, simply place a pencil mark thus——— opposite the name of the department or party you wish it delivered to and place it in the "outward" box where the messenger receives it, leaving the mark on until he reaches the station it is to be delivered to where he erases the mark and drops it in their "Inward" box.

This system will be found very convenient to every manufacturer and especially where there is a cost system in use, there being numerous time tickets, requisitions, etc., sent from the factory to the office.

* Chief Cost Clerk, Waterous Engine Works, Brantford.

Waterous, Brantford, Canada.

THIS ENVELOPE FOR FACTORY MESSENGER SERVICE ONLY.

To direct envelope place a check mark with a lead pencil, not Indelible, opposite the Department name in the blank.

DO NOT WRITE OTHER NAMES ON THIS ENVELOPE.

All envelopes are to be sent to the departments, the memos they contain being plainly marked for the parties for whom they are intended in the departments.

AN INCLINED HYDRAULIC SYSTEM.

By Frank C. Perkins.

A novel lift system utilizing an incline plane is shown in the accompanying illustrations Figs. 1 and 2. Fig. 1 shows the inlined plane elevator car loaded with a heavy engine casting, while Fig. 2, shows the car platform of the lift in its lowest position.

Very heavy engine castings had to be transferred between the two floors of two workshops, where there was a considerable difference of level. This form of elevator was constructed as the most practical and economical on account of the castings in many cases being very long and producing unequal weights on the car.

It will be noted that the car provided is very long, moving on an incline plane of concrete with rails on the platform and a track below with a hydraulic cylinder placed on the incline between the rail.

By this construction there was no trouble encountered in loading very long pieces or placing the same on one side as the difference in weight on the various portions of the car had no influence on the proper working of the machine. The hydraulic cylinder on the incline in the centre of the track communicates with a vertical tank placed near the wall in the background and supplying the necessary power for raising the car. There is a valve provided in the piping connecting the cylinder with the tank. which is shut off in order that the car remains stationary wherever it is stopped. By closing this valve when the loaded car has reached the top of the incline, there is no possible way for the platform to slide down the incline. The vertical tank near the wall is connected with the compressed air piping of the factory and the working of the elevator is extremely simple.

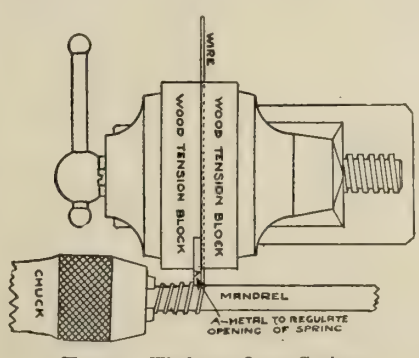
Fig. 1.—Incline Plane Elevator Car.

In order to lower the car when the platform is at the top of incline the compressed air is allowed to escape and the valve between the inclined cylinder and vertical tank is opened by lifting a counterweight on the level of the cock. The car and platform reaches the bottom of the incline in about 30 seconds when the operation drops the counterweight and the valve is closed. If desired the air cock is then opened in order to be ready for immediate hoisting when desired, at the proper moment it only being necessary to again raise the counter-weight.

Fig. 2.—Car Platform in Lowest Position.

HOW TO WIND AN OPEN SPRING.

An easy way to wind a spring of the compression type will be found in the accompanying illustration. The mandrel on which the spring is wound is selected according to size of spring wanted. In this case the mandrel and the end of the wire were fastened in the chuck of a carpenter's brace. The piece A is a narrow strip of metal, the thickness of which regulates the spacing of the coils.



How to Wind an Open Spring.

If a closed tension spring is wanted, the piece A is left out entirely. The wooden tension blocks are clamped with the proper tension in a vise. If no vise can be procured, an ordinary clamp will answer the purpose.—Scientific American.

VANADIUM STEELS.

Vanadium steels, their classification and heat treatment with directions for application of vanadium to iron and steel is the subject of an 84 page booklet by J. Kent Smith and issued by the American Vanadium Co., Frick Bldg., Pittsburg. Its toughening effect on steel is pointed out. Tables are given with regard to composition and heat treatment, the results given being deduced from experience with chrome-vanadium steels.

The use of vanadium steel for railroad work is dealt with, tables being given showing the application of vanadium steel with the type of metal and heat treatment. It is claimed that locomotive axles, springs, etc., may be made much lighter than now in common use and yet possess better tenacity and longer life. These steels are also applied to bridge work.

SCHOOL FOR RAILWAY MEN.

A School of Locomotive Instruction was recently started in Truro, N.S., in connection with the I.R.C. mechanical department. A large room in the Rest House at the Round House is used. The room is provided with railway appliances, regular classes are held and the men take a great interest in the discussions. Among the classes are those in mathematics, repair, care and despatch of locomotives, best methods, etc. Among those interested in the organization are: Charles McCarthy, a brake instructor, and James D. Turner, chief car inspector, and Superintendent of wrecking appliances of Moncton, and M. M. McLaren, chief train despatcher of Truro.

BUSINESS ENGINEERING.

The faculty of science at McGill University have arranged for a course of lectures with a view to giving engineering students some knowledge of business. R. A. Ross, M.P., secretary of Ross & Holgate, has been secured to give a course of 25 lectures on business engineering or engineering economics, to third year students. For all departments but electrical engineering this course will be obligatory. Some of the subjects included in the course will be: Property currency, documents, securities, bonds, the Bank Act, the Companies Act, company financing and trust companies.

LOCOMOTIVE TYPE MARINE BOILER.

By A. W. Spotton.*

The Goldie & McCulloch Co., Limited, Galt, Ont., have recently supplied some marine boilers for use in British Columbia. These boilers were built for a working pressure of 200 pounds. The accompanying cut shows the boiler in course of erection, and as will be noted the wagon top is of larger radius than the barrel and joined to it by a taper course. The fire box is exceptionally deep and provided with two fire doors, the upper one used when burning wood and the lower one when burning coal. The ash pit and smoke box are detachable and are bolted to the body of the boiler. The smoke box is provided with a spark hopper and spark arrester. The barrel of the boiler is 60 inches diameter and the wagon top 67 inches diameter. The fire box is 56 inches wide by 7 feet long and the boiler contains 156 tubes two inches diameter by 14 feet long.

The longitudinal seams are double butt strapped and double riveted, while the circumferential seams are lap and double riveted.

Dimensions.

The following table gives the principal dimensions.

Diameter of barrel	60 in.
Diameter of wagon top	67 in.
Width of fire box	56 in.
Length of fire box	7 ft.
Number of tubes	156
Diameter of tubes.....	2 in.
Length of tubes	14 ft.
Length of smoke box	4 ft.
Overall length of boiler....	25 ft. 5 in.
Thickness of barrel shell	21-32 in.
Thickness of wagon top	32-32 in.
Thickness of tube sheet	9-16 in.
Thickness of crown sheet....	7-16 in.
Heating surface	1,300 sq. ft.
Grate surface	32.5 sq. ft.
Ratio of heating to grate surface	40
Working pressure....	200 lbs. per sq. in.

* Mechanical Engineer, Goldie & McCulloch Co., Galt, Ont.

DODGE TRANSMISSION MACHINERY.

The Dodge Mfg. Co., Toronto, are filling some large contracts at the present time, including a complete machinery equipment for the C.P.R. million bushel grain elevator at Victoria Harbor. The contract covers over 400 tons of iron work. Several carloads of this have been delivered and the rest is nearing completion in the shops.

Reproduced on the page opposite are three views of a large pulley recently completed in the Dodge shops, for a continuous rope drive, in one of the mines in British Columbia. Fig. 1 shows the 20-ft. wheel on the boring mill. The man on the centre will give an idea of the size of the wheel. An extension arm is used in boring large pulleys, and was used in this case.

Fig. 2 shows half of the same pulley with a number of men from the works. This gives a good idea of the size of the pulley. Fig. 3 shows the 20' rope wheel on the balancing ways.

SUBSCRIPTION RATE.

Canada, United States, $1.00, Great Britain, Australia and other colonies 4s. 6d., per year; other countries, $1.50. Advertising rates on request.

Subscribers who are not receiving their paper regularly will confer a favor on us by letting us know. We should be notified at once of any change in address, giving both old and new.

Vol. VI. February, 1910 No. 2

A CHAT WITH THE EDITOR.

We, the editors of Canadian Machinery, would very much like to have a ten-minute chat with each and every one of our readers at least twice a year. We want to do this because we want you to get confidential and tell us how you like the paper, what you would criticize about it, etc. It is in this way, and, we believe, only in this way, that we can make Canadian Machinery of greatest use to you.

The trouble is that if each of you were to pass through our office, stopping only for ten minutes, it would take over four months to go from A to Z, and in the meantime where would Canadian Machinery be? So what we want you to do is to sit down some evening when you have ten or fifteen minutes to spare and write us a letter containing your views, criticisms, etc. Call us down, if you think we need it. It will probably do us both good—you, to get it out of your system, and us, to have our weak spots shown up. Sometimes, you know, editors like us are apt to get the idea that our paper is just about perfect, when in reality there is loads of room for improvement. We will admit that we do think Canadian Machinery IS a pretty good paper for its field, but it can be made much better and we want your help.

If you don't want your letter published, say so, and that settles THAT question. If you have any ideas about machine shop and foundry management, labor-saving dodges, jigs, systems, etc., tell us about them, because we pay real money for those sort of letters.

Another thing: If you are interested in any line of machinery, write to Canadian Machinery advertisers and get their catalogues. They will be glad to send them if you mention Canadian Machinery, and a good library of up-to-date catalogues is a mighty good thing to have. They generally contain a fund of useful information that every man connected with a machine shop should have. It's cheap information, too—only a two-cent stamp and a few minutes' time per catalogue.

But, whatever you do, we want you to write to us about Canadian Machinery. We are making a frank confession to you, that we are aware of the room for improvement, and we reiterate: we want your co-operation. After all, it is the readers' co-operation that makes or breaks a paper. You pay for the publishing indirectly, because you make it pay the advertisers to use our columns, and therein is the paper's revenue. So, you see, we are anxious to "get in right" with you, and the only way for us to know when we have reached this stage is to have you tell us (without gloves on) when and how we are in wrong. Won't you?

AN ANTI-COMBINE BILL.

Readers will be interested in the bill introduced in Parliament this week by Hon. Mackenzie King with the object of preventing the formation and continuance of organizations controlling the market on any commodity in a monopolistic manner.

It is proposed that any six persons who believe that a combine exists may send a request for an investigation. The judge then orders a hearing, and if he finds that there is a prima facie case, he may direct an investigation to be made through the machinery provided by the Act. The Board of Investigation will consist of three members, one to be appointed on the recommendation of the complainants, another on the recommendation of the defendants, and the third by these two. If it is found that an unfair combination exists, the duty upon the article concerned may be removed or decreased, or a fine of a thousand dollars a day may be imposed.

Provision is also made that in case the owner or holder of a patent makes use of the exclusive rights he controls so as to unduly limit the manufacture or supply of such article in a manner to injure trade or commerce such patents shall be liable to be revoked.

Weakness of Bill.

Every fair-minded man, every business man and every student of economics recognizes that one of the conditions of modern business methods is the development of mergers and combinations; in other words of agreements between various classes of mercantile enterprises.

Some combinations are no doubt based on illegitimate grounds. Their sole aim is to bleed the public. But they are not all of this type. On the contrary we believe the majority of these mergers or agreements are not only based on sound business principles, but on sound moral principles as well. They are merely created with a view to rectifying evils or curtailing cost of doing business.

But as the law now stands the legitimate merger, combination, agreement, or whatever we may choose to call it, is subject to irritating, costly and unjust legal proceedings. This ought not to be, and could easily be obviated if the Government would provide proper safeguards which would at the same time protect the public as well as the members of the combinations which were legally and morally sound.

It appears to us that the most simple way of doing this would be for the Government to create a permanent board similar to that of the Railway Commission, which is doing such good work in the interests of the shippers and traveling public of the country. This board could make a tentative examination of any charges made, and if a prima facie case was made out take such steps as

would lead to a thorough investigation and the punishment of the parties if found guilty.

No one denies to-day the right of labor to combine for legitimate purposes. No one would probably deny that in theory business men enjoy the same right. But in practice they do not enjoy the same right. Wherever and whenever business men combine, merge, or organize in any way the fact is heralded by the daily press as a menace to the public welfare, and the authorities are forced to prosecute and the members of the combination to protect themselves in a costly, and usually long-pending suit, whether they are innocent or guilty.

A permanent board such as suggested would protect the public, and at the same time prevent pernicious and unjust prosecutions of business men, whose organizations are founded upon equity and justice.

The weakness of the bill now before the House of Commons, is that it does not provide for this much needed machinery.

ILLEGITIMATE SALESMANSHIP.

In spite of the rigorous provisions of the Secret Commissions Act, which prohibits the giving of secret rebates and commisions, there are still some salesmen who in their desire to get business are resorting to practices which are forbidden by the Act.

Our attention is frequently drawn to flagrant breaches of the Act and one of the most common practices in this regard appears to be the passing from the pocket of the salesman to the palm of the customer a sum of money sufficient to induce the latter to place an order for goods on which there is a fixed selling price.

Aside altogether from the moral aspect of such practices they are proofs of poor rather than good salesmanship. When a salesman resorts to secret rebates and other dishonest practices in order to secure business it is an acknowledgement of his own inefficiency to sell goods in the ordinary way.

The true salesman is he who relies upon the merits of his goods, plus his own personality, to effect sales; not he who is so unwise as to run the risk of incurring severe legal penalties in order to accomplish that which he cannot do by legitimate means.

One thing that perhaps can be said in favor of the salesman who is ready to break the law in order to effect a sale is that he is at least courageous in view of the fact that he is running the risk of a maximum penalty of a $2,500 fine or two years' imprisonment.

Those who have to substitute crookedness for efficiency should either learn the secret of true salesmanship or embark in some vocation in which dishonesty rules all actions.

Some day somebody will be caught, when there will be wailing and gnashing of teeth.

MACHINE SHOP MANAGEMENT.

Those who have watched the development of the machine shop cannot fail to be struck with the great improvement in the present day shops over those of only a few years ago. Improvements in mechanism have kept pace with improvements in systems, factories are better designed, they are more fireproof, cost systems have been installed, work is handled with greater facility by means of cranes, tracks, etc., and perhaps better than all these is the fact that the near sighted policies of dealing with men are being eliminated and forgotten, and mechanics are being taught to stand on their own feet. Instead of the "old man" glowering around to see where he can find fault, there is the utmost harmony between mechanics, foremen, superintendent and proprietor.

The system that leads to this harmonious end should be encouraged. Trusting the men will go a long way towards harmonious relationships. The benefit societies installed in many shops, the rest and recreation rooms, the educational systems, first aid to injured, etc., are developments in factory system and management which cannot help but draw out the best in every conscientious workmen.

The forman or superintendent of a few years ago, who ruled by fear would look in wonder at the machine shop of to-day where the superintendent, foremen and workmen are all friends. The care of the workmen is an important feature in machine shop management which, with the educational features, has united the managers and workmen better than any forcible means could ever accomplish. In this issue is described the system of First Aid in the Angus Shops, Montreal. This system can be applied to any shop where the management and workmen co-operate.

One thing that the machine shop management, except in a few cases, have neglected is the protection of machinery. Canadian Machinery has, in almost every issue, brought to the notice of managers, superintendents, foremen and other readers, the necessity of protecting machinery. We are rewarded by many methods being adopted—cages are used to protect belting, floor countershafts are being boarded over and other means are being used. There is still a large field for improvement along this line.

Other things, if adopted, will also increase the efficiency of the shop. Toilet rooms, tool rooms and store rooms are often arranged at great distances. To concentrate these, toilet rooms should be arranged so that the men will not lose time by walking unnecessary distances. Tool rooms and store rooms have been concentrated in some shops by using boys to deliver tools, etc., thus saving the time of expensive men. In this case a private telephone exchange is necessary. It can be computed in dollars and cents, the loss of time caused by the average man to walk one hundred yards and return. The management should not keep their view concentrated on direct expenses, but the indirect expenses should receive attention. A close following up of these items will greatly increase the efficiency of the workmen and largely increase the output of the shops, even more than at the present time.

NOTES OF THE MONTH.

The French Treaty has been ratified by both the French and Canadian governments and will shortly become operative.

* * *

The people of Toronto recognize the value to Canada of the Canadian National Exhibition, and have voted $320,000 to provide new buildings, and other improvements at the Fair. These will be completed during the next three years and will include: Live Stock Arena, $110,000; Machinery Hall, $75,000; Women's Building, $60,000; Poultry Building, $30,000; Dog Building, $25,000; Lavatory accommodation, $20,000; Women's rest building, $7,000; Band Stand, $350. It is sincerely hoped that the new Machinery Hall, which will be one of the most educative features of the Exhibiyion, will be started at once.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

UNIVERSAL DIVIDING HEAD.

The Universal Dividing Head is perhaps the most delicate and important mechanism connected with the milling machine. It is subjected to frequent and varied use, and the work done by it must, as a rule, be thoroughly accurate. The ideal dividing head therefore must be essentially accurate; must be of such construction as best to preserve that accuracy, both by its rigidity and by its method of adjustment; must be compact and convenient, and universal in its scope. In their new and improved Universal Dividing Head, the Kempsmith Mfg. Co., Milwaukee, Wis., have embodied these considerations in a marked degree. Its substantial and compact construction is well indicated by Fig. 1.

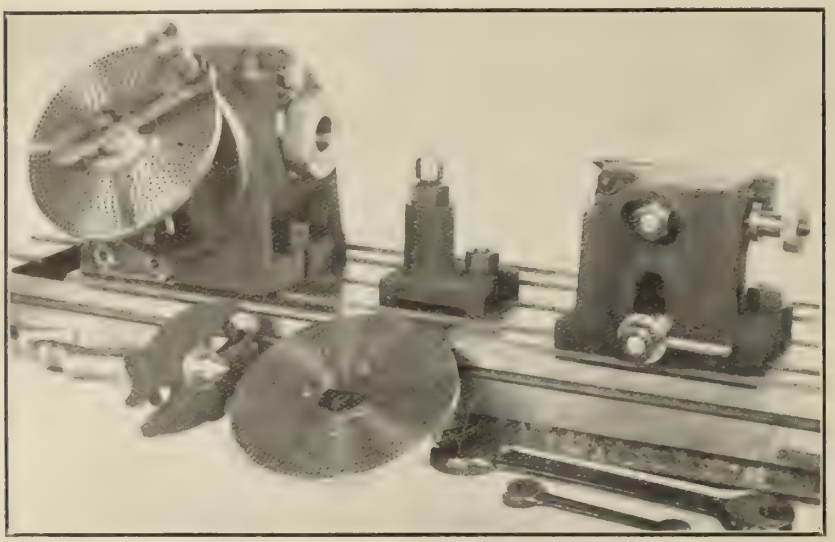

Fig. 1.—Kempsmith New Style Universal Dividing Head.

The most important feature of the dividing head is the dividing mechanism. Large diameter worm wheel is essential to the best work. On this dividing head the worm wheel is mounted centrally inside the head block, between the front and rear spindle bearings. It is keyed and pressed to spindle, insuring positive movement to spindle when engaged by worm. The worm is located at an angle, the worm shaft being at an angle of 36 degrees from the horizontal. This brings the point of mesh of worm with worm wheel correspondingly around to an angle from the vertical. This makes it possible to utilize a great deal of extra space for the worm wheel, otherwise occupied necessarily by the worm, when located directly over or under the worm wheel. The result is that the worm wheel can be made extremely large in proportion to the size of the head—5¼ inches diameter on the 10½ inch swing head, and 6½ inch diameter on the 13¼ inch swing head.

The worm is in one piece with the worm shaft which runs in a long and liberal bearing. This bearing extends up to the shoulder formed by the worm proper, and consequently affords strong bearing support close to the point of mesh. The worm runs constantly in oil. The wear between the worm and worm wheel is very easily taken up through outside adjusting screw shown. This adjustment is in a straight line, perpendicular to the axis of the worm wheel, and thus preserves the alignment and accuracy in repeated adjustments. The worm is easily disengaged from the worm wheel for quick index through worm wheel direct. This is through means entirely independent of its adjustment, which therefore is not disturbed. Another advantage is that, in the common necessity of tightening the nut on arbors which have been put in the spindle, the strain is relieved from the worm wheel teeth.

The index plunger is mounted on the worm shaft, therefore indexing directly to the worm wheel, leaving no chance for error or inaccurancy. The fact that the worm shaft is set at an angle as already described, likewise locates the index plate at an angle from the vertical. This makes it easy for the operator to read in indexing, because it is directly in his line of vision in his natural operating position. Two index plates are regularly furnished, providing all division changes up to 60, all even numbers and multiples of 5, up to 120, and a very liberal number of division changes between 120 and 400. Three special high number index plates can be furnished, which provide 122 additional division changes between 61 and 400,

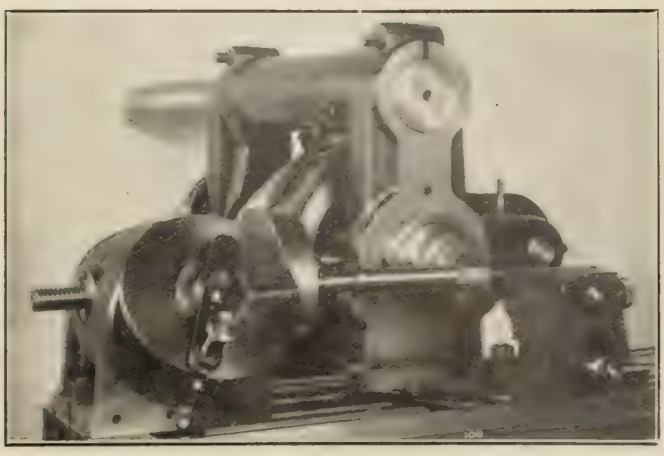

Fig. 2—Head Showing Work Passed Through Spindle.

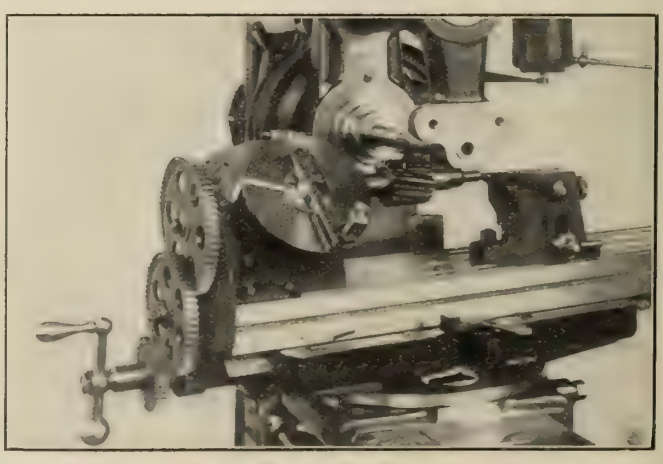

Fig. 3.—Head Arranged for Cutting Ordinary Spiral.

including all divisions up to 200, not obtained through the standard index plates. This fact of the index plate being at an angle will also permit of still larger plates being mounted in extremely special individual instances without requiring increase in the swing of the dividing head.

Direct indexing is easily accomplished with worm and worm wheel disengaged. The plunger engages the circle of holes in the front of the worm wheel. The spindle is graduated to correspond, on the front shoulder.

The spindle is large with liberal taper bearings, and has a simple and powerful locking device, and is furnished with the same size taper hole and threaded nose as on the main spindle of the universal millers on which the head is regularly furnished, making all tools interchangeable, has a large hole running through, an idea of which can be gathered from Fig. 2, which shows the work passed through the spindle. The rear end of the spindle is arranged to receive an extension stud for use in gearing direct from the lead-screw to the spindle for cutting fine leads as described later. The rotating block carrying the spindle swings through an arc of 150 degrees, from 10 degrees below the horizontal to 50 degrees beyond the perpendicular. It is powerfully clamped in a horizontal or vertical or angular position by two bolts. These bolts clamp the whole surface of flanges around the periphery at both front and rear sides of the head.

This dividing head is furnished with a series of 12 change gears for spiral milling. The change gear bracket is very easily attached or removed. The mitre gear on this meshes with the mitre gear attached to the index plate; the worm is driven direct from the change gear shaft. Fig. 3 shows the dividing head set up with a train of change gears in the usual manner for cutting an ordinary spiral, the job shown being a standard spiral milling cutter 3 inch diameter, 18 teeth, with 48-inch lead of the spiral. On this dividing head a very interesting departure is provided for short leads, by which the gear train is led direct from lead-screw to the dividing head spindle, an extension stud being provided on the spindle as already described. This is shown in Fig. 4, and this also shows the use of the Universal Milling Attachment where the angle between cutter and work is greater than can be obtained through the swivel table. In the charts which accompany this dividing head, data is given for leads from .120 to 1½ inches through gearing direct, and for leads from 1.550 to 100 inches for gearing through the worm.

Fig. 5 shows a method employed in testing the accuracy of the worm wheel in every tooth. The master plate is mounted in the spindle and has 40 perfect divisions. It is therefore possible to test the relative and cumulative error for the teeth individually. The maximum relative error allowed is .0005 on the master plate, and the maximum cumulative error at any point is .002 on the master plate. The average is less than half of this. The master plate is 11 inch diameter, and worm wheel 5¼ inch diameter, consequently errors on the master plate are correspondingly reduced on the worm wheel proper.

The tailstock is of the side centre type. The centre is set into the tailstock at an angle, bringing the centre within ⅛-inch of inner side of the tailtop. This allows the use of large diameter shank or end milling cutters in squaring shafts, and similar work, as shown in Fig. 2. The centre is firmly fixed in the tailstock and has rapid and easy adjustment. It can be elevated by rack and pinion for milling tapers, and can be tilted and clamped into alignment with the work. This Universal Dividing Head is furnished in two sizes, to swing 10½ and 13¼ inches.

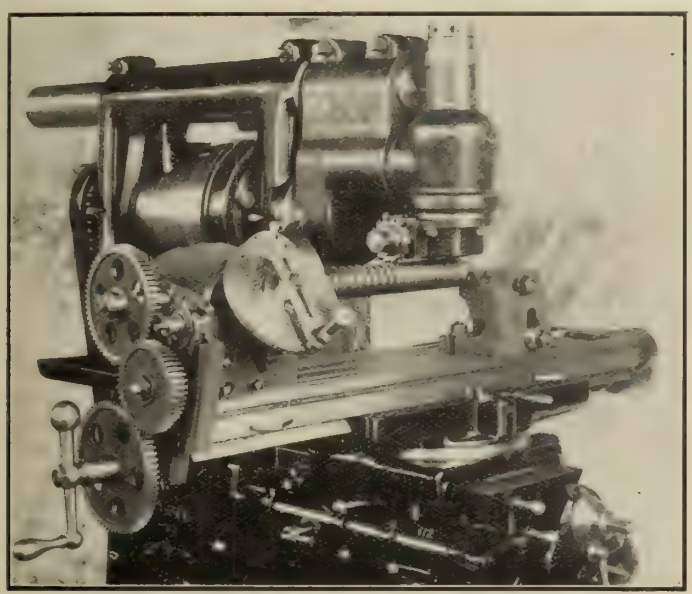

Fig. 4.—Short Lead; the Gear Train is Led Direct from Lead Screw.

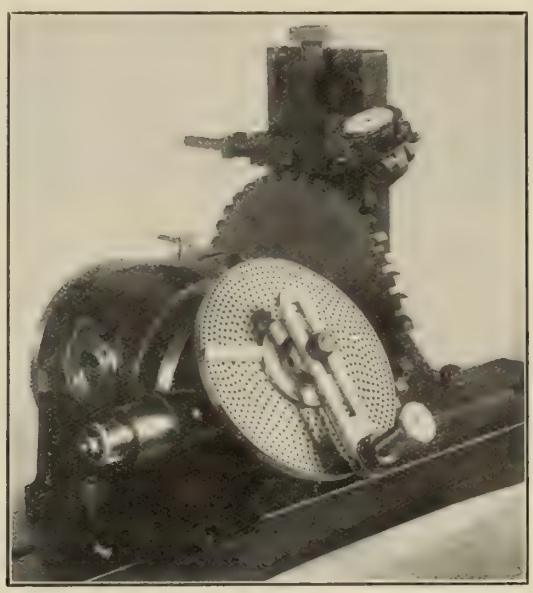

Fig. 5.—Testing Accuracy of Worm Teeth.

CAMSHAFT GRINDER.

The camshaft of an automobile or marine engine is an all essential factor. Its cams, differing in angle one from another, must be exact of form and exact of angle. The desirability of having them made in one piece with their shaft is evident. For grinding the cam forms on a camshaft The Norton Grinding Co., Worcester, Mass., has developed an attachment to be used on its standard type of machine.

The fixture, as may be seen in Fig. 1, is fastened on the machine in the same manner as the head and tailstock and is arranged to have a rocking motion, that the line of the cam form may be followed in the grinding. The work is mounted on centres and is held by a special dogging device, the dog being held tight between two pins on a face plate. The end of the work is splined and keyed into the dog, so that exact alignment is maintained, until the last operation, the grinding of the last cam completed. Upon the shaft of the attachment, in which is the head centre, is mounted a group of master cams, corresponding in number and form and angle to the cams to be ground. This shaft is driven by gears from the main driving plate of the machine. Fastened to the table, like a back rest, is a

bracket which carries a rod upon which slides a roll carrier. The rod is drilled to receive a pin in the roll carrier, there being a pin position to bring the roll opposite each of the master cams. The cam is held against the roll by spring pressure. This is accomplished by a spring plunger, consisting of a heavy casing with a plunger backed by a powerful spring, which is always acting to keep the master cam in full contact with the roller. As the roller is fixed in position the camshaft is constrained to oscillate as it rotates in definite relation to the form of the master cam. In doing the work the roll is pinned in position against the first master cam, and the grinding continues until the first cam of the work has been finished. The roller then passes to its second position and the second cam to the grinding wheel, and so on until the shaft is completed.

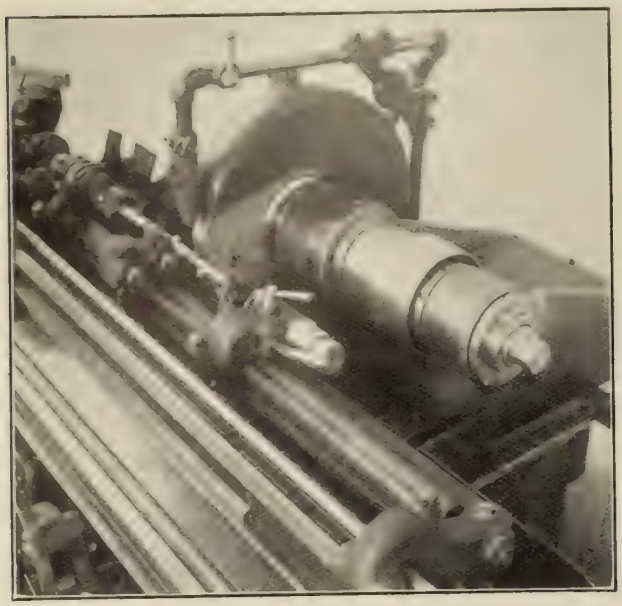

Fig. 1.—Cam Grinding Attachment.

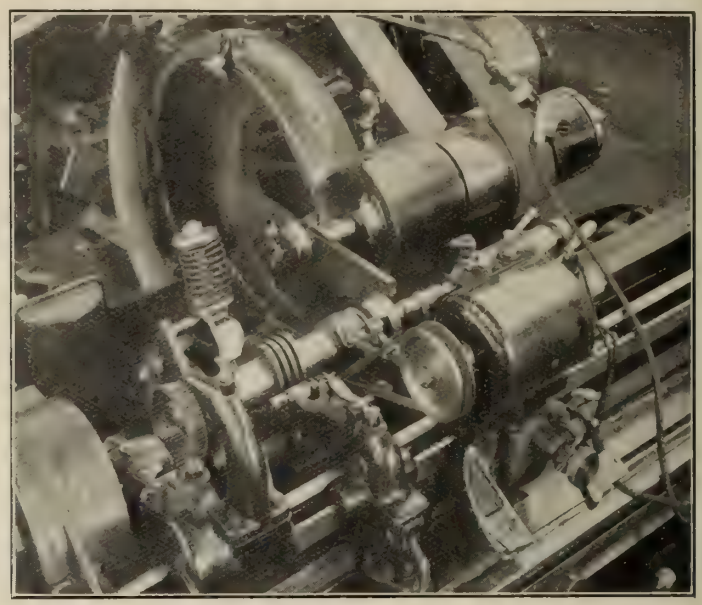

Fig. 2.—Grinder Arranged for Grinding Master Cams.

The master cams themselves are produced in much the same manner, a model cam being used to give the required form. The group of blanks is mounted in the attachment, as shown in Fig. 2. A stationary steel arc of the same radius as the grinding wheel takes its place and is maintained in contact with the model cam which for the time being is the master. Spring pressure is applied to accomplish this function, but the plunger is arranged to act in the reverse direction. The grinding of the master cam blanks is done by a small wheel mounted in a fixture. This wheel takes the place of the roll and is in the same relative position that the roll occupies to the master cams during the grinding of camshafts, and in the final operation is sized to micrometer to the exact size that the roll will be. Consequently the conditions attending the grinding of the master cams are identical with those which exist when these cams are employed in commercial work, and a corresponding degree of reliance may be placed upon the accuracy of the product. Fig. 3 shows a typical solid camshaft ground with this attachment.

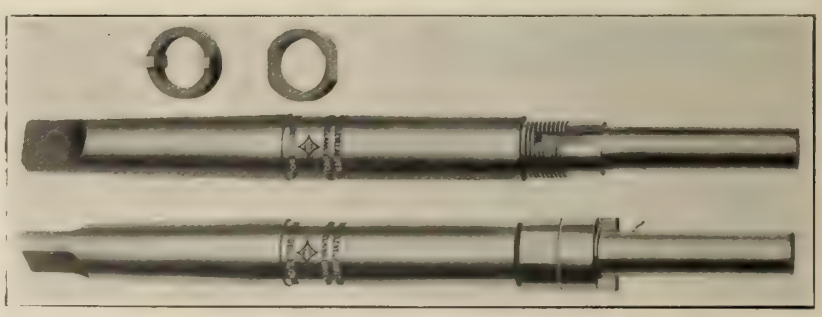
Fig. 3.—A Solid Crankshaft Ground in the Cam Shaft Grinder

RELEASING ARBOR.

The Cleveland Twist Drill Co., Cleveland, has secured the patents and is about to place on the market a new arbor for shell tools. As is indicated in the accompanying illustration, the essential difference between this patent arbor and the regular type is that it is equipped with an adjustable collar provided with integral keys, which slide in longitudinal keyways in the arbor. The arbor is also threaded for a short distance to receive an adjusting nut, which bears on the collar. The collar engages the shell reamers in the usual way.

Perhaps the chief advantage of the new arbor is the quickness and ease with which it releases the shell tool, no matter how tightly it may have become jammed on the arbor; a turn or two of the adjusting nut does the trick, with no necessity for removing the arbor from the spindle, and no excuse for the vise and hammer methods which often cause considerable damage.

Another decided advantage is the fact that the collar can always be set so as to allow the shell tool to fit snugly on the arbor, and yet fully engage with its slots the collar keys.

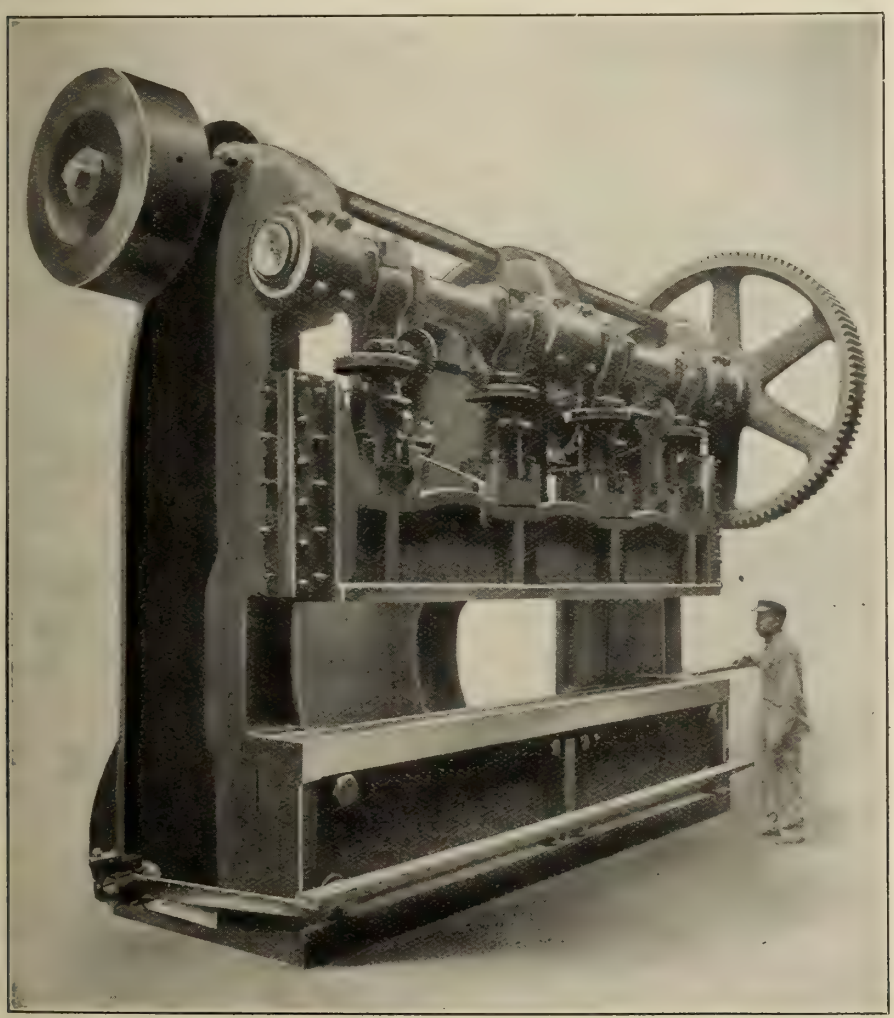


Patent Releasing Arbor of Cleveland Twist Drill Co.

A. S. Herbert, manager of Canadian branch of Siemens Bros., Dynamo Works, Stafford, England, sailed for England on Jan. 6, and will spend about two months in the Old Country.

LARGE DOUBLE-DOUBLE-CRANK PRESS.

The E. W. Bliss Co., 20 Adams Street, Brooklyn, N.Y., have recently designed and built a large double-double-crank press, shown in the accompanying illustration. The large machine is of the double-crank type, of a special design, being in reality a double-double-crank press. The machine is especially adapted for the operation of very long and narrow dies, for punching, forming, piercing, bending and similar operations which require great pressure. It embodies certain improvements in detail which adapt it to the special work it has to do. The machine, which is double-geared, is driven by power friction clutch located on the driving shaft, which clutch is engaged and disengaged by means of the treadle running along the entire front of the press; the treadle being connected by treadle levers with a treadle shaft located at the rear of the press, to which is attached the counter weights and connections which operate directly upon the clutch.



Bliss Large Double-Double Crank Press.

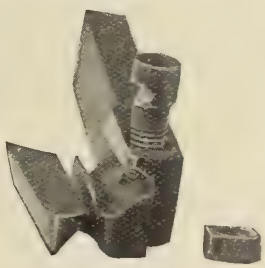
In the construction of large presses of the double-crank type, an important consideration on account of alignment and weight is the adjustment of the slide. In the press shown, this is taken off in a very effective and simple way by a chain drive—the chains running from the shafts carrying the adjusting bevel pinions back to a small driving shaft, which runs the entire width of the press. This shaft which derives its power by means of a belt from the main driving shaft, is fitted with two friction clutches. In order to raise or lower the slide, it is only necessary for the operator to shift the lever located above the slide between the two cranks at the left-hand side of the press, which engages the clutch which operates the chain drive. This, in turn, operates the four adjusting screws in unison, and in addition to quickly doing what would otherwise be slow and laborious work, insures the perfect alignment of the side in relation to the bed. By shifting the lever to the right, the slide is raised, and by shifting to the left it is lowered.

Lang's New Tool Holder.

LANG'S NEW TOOL HOLDER.

The principal feature of advantage claimed for Lang's new tool holder is that it will take a much heavier cut than is possible with the ordinary tool holder. The cutter is of triangular section, and is held rigid in the "V" slot, which insures a perfect fit between the cutter and holder. It is also backed up clear to the cutting end with a support which prevents the cutter from springing down or back away from the work.

The tools are made in right and left hand and are intended to be used exactly as the solid forged tool. One of the great disadvantages heretofore in using an inserted cutter of this kind has been the tendency of the cutter to slip back in the holder. This is especially noticeable on heavy, long cuts. This fault has been overcome in this holder by the insertion of an ordinary steel ball at the rear of the cutter. These balls are advanced from pocket to pocket as the end of the cutter is worn away and moved forward. The pockets are connected together by a slot as shown, and when the cutter is loosened, the balls are easily changed from one pocket to the other but after the cutter is back in position, it is impossible for the ball to drop out, as the cutter hits it above the center, forcing it against the bottom of the pocket where the entire thrust is taken. This positive stop is not intended to be used on ordinary work, as the clamping bolt holds the cutter sufficiently tight for all ordinary purposes for which tool holders are usually used. These holders are manufactured by G. R. Lang Co., Meadville, Pa.



Lang's New Tool Holder.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

DETROIT CONVENTION.

The convention in Detroit, June 6-10, promises to be a greater success than ever. The American Foundrymen's Association, the American Brass Association and the Foundry and Manufacturers' Supply Association have well organized local committees for making the convention a success.

From present indications the Supply Men will use twice the space used at the previous events to house the exhibits, and it is urged that all who intend to exhibit complete their plans at an early date and at the same time inform Secretary C. E. Hoyt as to the amount of space they desire, etc. The permanent buildings will have concrete floors on the ground level, and exhibits requiring foundations and pits will have to be placed in the temporary buildings. The main building space will not be laid out or temporary building plans made until information is received concerning members' requirements. The cost of space will be 50 cents per square foot. The Cadillac hotel has been chosen as headquarters for the Foundry and Manufacturers' Supply Associations.

The following are the secretaries: Dr. Richard Moldenke, Watching, N.J., American Foundrymen's Association; W. M. Corse, Detroit, American Brass Founders' Association; C. E. Hoyt, Chicago, American Foundry Foremen, and Foundry and Manufacturers' Supply Association.

HANDY OFFICE RULE.

The Dominion Foundry Supply Co., Montreal and Toronto, are remembering their friends with a handy and useful souvenir in the shape of a fifteen inch office rule. On the front in addition to the name are the words, "Everything you need in the Foundry." On the reverse side is a list of the wide range of equipment carried by the Dominion Foundry Supply Co.

HANDSOME CALENDAR.

The Hamilton Facing Mill Co., foundry outfitters, Hamilton, remembered their customers on Christmas with one of the handsomest calendars yet issued for advertising purposes. It is a reproduction of that beautiful home scene of Albert Herter, "Just a Song at Twilight." The effect of the light from the fireplace is very marked, it greatly increasing the romantic, twilight sentiment of the scene. The lady is at the piano, her face veiled in shadow, while the meditative features of the father and the face of the sleeping child are illumined by the firelight, the whole effect being one of soft peacefulness and solemn joy. The managers of the Hamilton Facing Mill Co. are to be congratulated on their aesthetic taste.

TABER SHOCKLESS JARRING MACHINE.

Jarring machines have been steadily growing in favor for the last five or six years, prior to which, this method of ramming sand, although not new by any means, was not recognized or appreciated beyond a very limited field. Like many other good things which have not been pushed commercially or advertised extensively, the jarring machine has had a long period of respose since its original conception by Hainsworth in 1869. Improvements were made from time to time by various inventors, notably by Jarvis Adams in 1878, but the machines were not exploited and were confined in their use chiefly to the foundries controlled or operated by their inventors.

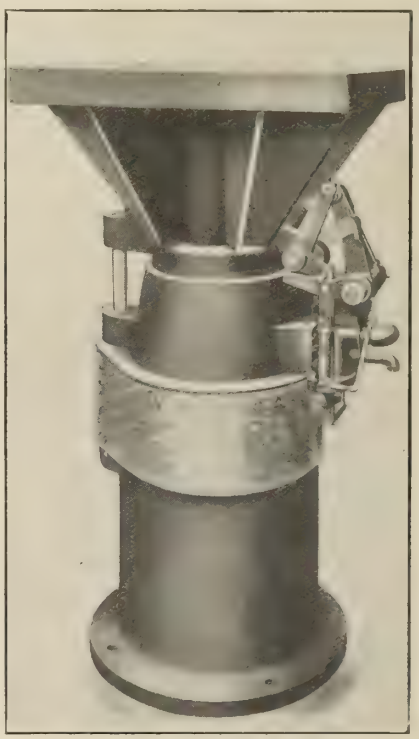


Fig.1.—Tabor Shockless Jarring Machine.

In the last decade, however, the public has gradually awakened to the advantages possessed by this method of ramming sand, and the development of the jarring machine has been correspondingly rapid, until to-day it is recognized as a most practicable method of ramming large bodies of sand by power. It is probably safe to say that ten years ago no one would have thought of a jarring machine for molds any larger than those used on a power squeezer which one or two men could handle, but it has since been found that large molds can be rammed as readily as small ones and to-day it is not uncommon to hear of jarring machines capable of ramming molds weighing ten to twenty tons. But with this increase in capacity has come the very serious complaint of damage due to foundation shocks when such heavy masses fall upon their anvil. These shocks are destructive to molds set up in the neighborhood of the machine and the ground waves sometimes travel far enough to cause serious annoyance in other departments of a manufacturing plant. Chemists complain that they can not use their sensitive balances while the jarring machine is running and the efficiency of offices and drawing rooms is impaired by the distracting and disturbing influence of the jarring machine near by.

The present machine has therefore been designed to eliminate these objectionable foundation shocks and to put upon the market a jarring machine which can be used in any position and under any conditions where an ordinary power squeezer would be practicable. Even in brass foundries on the upper floors of high buildings it is practical to instal a Tabor Shockless Jarring Machine if the building is strong enough to carry its weight.

To demonstrate this fact a small machine with 8 inch jarring cylinder has been built by The Tabor Mfg. Co. and the illustrations herewith are made from photographs of this machine, except the sectional view which has been taken from the design for a twenty-five ton machine on order.

Fig. 1 shows the machine as it appears ready to instal. Fig. 2 shows the same machine set up in a pit made to receive it with linkage connecting the operating valve on the machine to the operating levers as conveniently arranged near the jarring table.

Fig. 3 shows in section the jarring table the anvil cylinder and a simpler arrangement of connections to the operating valve than it was possible to

improvise for the photograph from which Fig. 2 was made.

Fig. 4 shows the bell cranks controlling the variable stroke of the jarring table and the automatic cut-off of the piston valve. This valve is of the differential pressure type operated by constant and intermittent pressure through the pilot valve, shown connected by link to bell crank in front of photo. The position of stop which controls length of stroke is designated by an arrow, and is shown in its minimum position, when the latch lever on the operating stand is in the lowest notch. See Fig. 3.

Fig. 5 shows the stop which controls the variable stroke in its maximum position. This machine consists of a jarring table made in one piece with the cylinder and mounted upon a cylindrical anvil, which in turn is guided by a cylindrical base and rests upon supporting springs calculated to give the anvil a substantial upward velocity while the table is falling.

Foundation Shock Eliminated.

The evil effects of foundation shocks in jarring machines have been recognized and deplored, and various attempts have been made to reduce the amount of shock transmitted to the foundation, but hitherto nothing has been done to effect its complete extinction, which is now accomplished by this machine.

It will be seen from the drawing that the supporting springs beneath the anvil carry the entire load of anvil, table and mold, and they do this under static conditions and also while the table is rising, but when the table reaches the upward limit of its travel, and when the air is exhausted to let it drop, the anvil is suddenly relieved of the air pressure, which supported the table, and as a natural result the springs beneath the anvil expand and accelerate its upward movement, while the table is falling. As a result, the momentum of the falling table and load is substantially equal to the momentum of the rising anvil at the instant of impact. These momentums neutralize each other, and the table is brought to rest without shock or jar upon any surrounding objects, as completely as if it had dropped upon an anvil of infinite weight. In order to do this the springs beneath the anvil have a very long compression, so that their loss in supporting power, as the anvil rises, will not materially affect its velocity.

Ordinarily, the springs are sufficient to give the desired momentum to the anvil, but in large machines, where the consumption of air is an important item, it is advantageous to utilize the air discharged from the jarring cylinder in augmenting the momentum of the anvil. This is done by making an additional port in the operating valve which connects the jarring cylinder and anvil cylinder while the table is falling. When the operating valve is again shifted to lift the table, the valve is opened to exhaust and the anvil is, therefore, free to drop.

Use of Air.

In this machine attention has been given to the economical use of air and the operating valve is designed to use it expansively in the jarring cylinder as well as to expand it again in the anvil cylinder, thus obtaining the benefit of two expansions. Of course, it is not possible to use the air expansively in the jarring cylinder when the load carried on the table approaches the maximum capacity of the machine, but when the machine is used on lighter loads, full air pressure can be admitted for a short distance and then cut off absolutely and expanded in the cylinder.

When the table reaches its maximum travel, the operating valve is automatically shifted to exhaust, and the air from it may pass directly into the atmosphere, or into the anvil cylinder, if the machine is large enough to make a second expansion worth while.

The cut-off is operated directly through the bell-crank lever acting as an adjustable stop upon an arm attached to the valve stem. The valve is reversed through the action of a pilot valve actuated by a similar bell-crank lever. There are, therefore, two adjustable stops on the table of the machine,

9. Blow valve connection.
Floor line
CONCRETE

Fig. 3.—Section of Jarring Table, Anvil Cylinder and Connections.

the positions of which are controlled by latch levers on an operating stand.

The cut off can be adjusted to suit the load carried on the table, and the operating valve can be reversed by the pilot valve when the maximum uplift desired has been reached. It is possible, of course, to substitute compressed air for the supporting springs under the anvil in the simpler type of machine, where no attempt is made to use air expansively from the jarring cylinder to the anvil cylinder.

The use of compressed air to support the anvil necessitates some provision for keeping pressure adjusted to the total load carried, without causing undue variation in the height of the jarring table, as it is more or less loaded, and as air may leak in or out.

The use of long compression springs

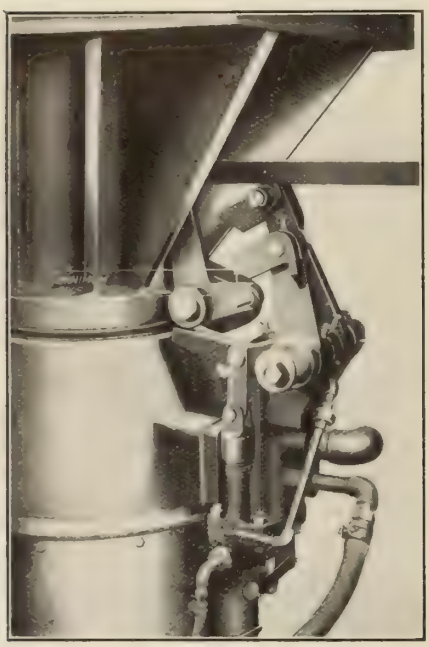

Fig. 4.—Stroke Control and Automatic Cut-off.

somewhat simplifies the construction, and has the further advantage of making it possible to utilize the complete expansion of the air.

The effect of impact between the table and anvil in jar ramming is measured by the change in velocity of the table, and the square of this change in velocity is proportional to the work done upon the sand for any assumed condition of the sand. Of course, the maximum work is done in the first few blows when the sand is loose, and as the operation is continued, the sand becomes more and more firmly compacted together, until finally it acts as one solid mass, and no further work can be done upon it until the severity of the blow has been increased. A short stroke indefinitely repeated will compact sand up to a certain density, a long stroke will compact it to a greater degree of density, and very hard ramming such as is frequently required in steel foundries, can only be effected by a considerable length of stroke. A variation in the length of stroke from 1 inch to 4 inches is, therefore, provided, depending upon the conditions to be met, and if any case should require more than 4 inches drop, it could easily be provided for in the valve controlling mechanism.

Attention is called to the simplicity of the construction, the enormous strength and stiffness of the cast steel table, ribbed around a central cylinder and acting as a beam of great depth to distribute the central force of impact applied to it equally in all directions.

The anvil is solid, and the blow delivered in this way by impact between two masses having approximately the same momentums, is far more efficient than can be obtained from a table dropping freely upon a stationary anvil.

Parts exposed to wear are protected by sand guards and provision is made for the renewal of such bearings as may in time become more or less worn. The accumulation of sand in the pit cannot affect the operation of the machine until it has attained great depth. At the same time, very little sand can find its way into the pit during the normal operation of the machine, and it will not be necessary to dig out the accumulation of sand very often.

The small machine of this type, weighing about three tons, which has been built and tested, demonstrates that no shock whatever on the foundation is at all perceptible. This machine was mounted upon two 8-inch channel beams in a pit about ten feet wide, the beams resting upon the sides of the pit and the machine resting in the middle of the beams. A man standing on these floor beams, while the machine was running, could not detect any vibration whatever, and although there was necessarily a slight change of load as the table rose and fell, the effect on the floor beams was no greater than it would be for an ordinary power squeezer operating in the usual way.

Ordinarily supporting springs under about 8 inch compression are used to carry the full load and with 4 inch stroke on the table the anvil movement would probably not exceed 2 inches, and ordinarily it would be very much less. The maximum variation in floor load would, therefore, not exceed 25 per cent. of the total load resting on the supporting springs, and this variation is so gradual that it does not partake of the nature of a shock at all. At the moment of impact the supporting springs simply cease to expand and therefore, cease to reduce the load on the foundation. Following this they again compress and gradually increase the load on the foundation by a comparatively small percentage of the total load carried.

Ordinarily the shock of impact in the common type of jarring machines, which rest upon a solid foundation, with or without the interposition of cushioning material, is followed by an enormous increase in the foundation load. In one type of machine, the table drops upon an anvil of comparatively little weight, resting upon a wooden crib, which rests in turn upon a concrete block. The momentum of the anvil and table is arrested in a very short distance by the compression of the wooden cribbing, and the foundation load is immediately multiplied many times, perhaps a hundred times the weight of the loaded table.

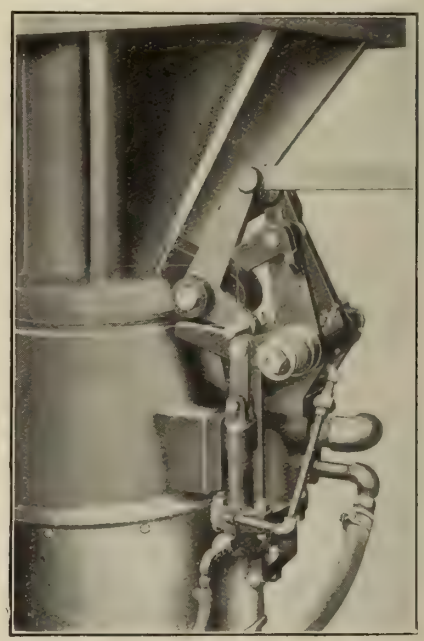

Fig. 5.—Stop of Variable Stroke in Maximum Position.

The Tabor Shockless Jarring machine is manufactured by the Tabor Mfg. Co., Philadelphia.

CONTINUOUS MELTING.*

By Geo. K. Hooper, M.E., New York

I am very glad to be able to discuss the subject of Continuous Melting, as it is one in which I am deeply interested and one with which in my experience of the last ten years in designing and building foundries, I have been intimately connected. My first piece of work, in fact, as an engineer was the development of a very complete continuous foundry system, and I have since designed several others and been connect-

* A discussion on Mr. Sleeth's paper presented at Cincinnati Foundrymen's Convention and reproduced in the January issue of Canadian Machinery.

ed with other foundries containing systems more or less continuous and am at present building for a well known interest a very large malleable foundry, embodying quite a complete system of mechanical handling, it being impossible in this case, of course, to carry on continuous pouring although the melting proper goes on practically all day.

Out of this experience I am enabled to enlarge somewhat upon the answers to questions asked Mr. Sleeth, for instance, that of, "on how small a tonnage can continuous melting be made to pay." He answered that this depends upon the work in any particular foundry upon which I would enlarge by saying that the tonnage has less influence on the economies to be gained by operating continuously than the number of molds to be handled, as it is at once apparent that a few molds may contain a large tonnage to which continuous methods would be entirely unsuited, while a less tonnage frequently is distributed in a a very large number of flasks, the handling of which, with the sand, castings, cores, etc., would undoubtedly yield lare economies if carried on mechanically and continuously. The mold, therefore, is the unit which must be used when considering whether the continuous method can be applied to any particular production, but it is not necessary to feel that if many sizes of molds are used, the system is inapplicable since, as the sand is handled mechanically, it may be a considerable saving to standardize flasks to a few sizes and adapt the patterns to these standardized flasks, thus enabling a larger range of work to be handled with a minimum of difference in equipment in flasks, machines, etc.

Hot Sand.

Again Mr. Sleeth was asked if the hot sand has any effect in causing loss of castings, his answer very truly being that generally it has no such effect if the pattern plate be suitably warmed. He spoke of a twenty-minute period as the time in which his sand is in circuit. I am able to enlarge upon this by saying that by means of large cooling and mixing riddles it is possible to considerably shorten this time and consequently the amount of sand handled and I am familiar with systems where the sand is actually in use again in a much shorter time than this, the first system with which I had to do, having the sand in transit less than three minutes from the time when it was dumped out hot, riddled, cooled, tempered, mixed and again deposited in the hoppers over the machines for reuse, going again into the mold undoubtedly within another three minutes.

Since the proof of the pudding lies in the eating, I am able to say that the foundry loss in this system was much less than when the molds were made on the floor, and this is, I find, the general experience of all who have these continuous systems, viz.: that they operate with less foundry loss than the same work when made on the floor even though a lower rate is paid for labor in operating such system than is customarily paid in floor work.

It is proper at this point to speak of methods of handling molding sand by means of conveyors, and I will say of this that in my experience, belts are the most suitable for this purpose. Canvas belts can be efficiently used where the sand is dry as in shaking out or dumping conveyors, but with tempered sand a rubber belt is preferable, as the sand will more freely discharge from it, and the moisture of the sand will have less effect on the belt's surface. Flat belts are superior to troughed belts for this service, and wide belts moving slowly than narrow fast-running belts.

A drag or scraper conveyor may be used in distributing sand to hoppers over molding machines, and is in fact, the best device for this service, and it also should be large and slow moving, both to avoid wear and to preserve the condition of the sand since the tempered molding sand has a tendency to "ball," and once in that condition must be crushed or dried to again render it suitable for use. The drag conveyor is preferably made with a wooden trough and wood conveyor flights.

Netting on riddles and sieves is preferably made of phospha bronze wire. Tap bolts and nuts on apparatus requiring renewals should also be of bronz .

One and Two Storey Foundry.

A type of "continuous foundry" has attracted considerable attention the past few years in which the moulding and pouring is done on one floor, the shaken out sand falling through gratings into a basement, where it is suitably prepared and sent again by elevators to the floor above for reuse. I have failed to discover any advantage in a foundry constructed in this way and it possesses, in fact the very serious disadvantages of high cost of instalation and operation, since a two-storey building costs at least three times as much as a one-storey building — probably the difference is greater than this, where a floor is filled with gratings and supports for machinery, a large expense is involved in duplication of equipment for screening and retempering sand, and more labor than is necessary is employed in this latter work.

It is entirely possible to handle all of the sand required by productions up to 100 tons of castings per day and over with two men although as much as 100 tons of sand per hour may be passing through the systems.

The users of a very successful system handling a large tonnage have informed me that they use no men at all on their sand-handling system, but it is difficult for me to believe that it is not given some attention during the day. I believe though that two inexpensive men can handle the largest sand conveying system.

Such two-storey foundries are therefore in my opinion and experience much more expensive to build and operate than modern practice makes necessary.

Mold Conveyor.

Mr. Sleeth was further asked if any damage is noted to molds from the movement of the mold conveyor to which he suitably responded that none is noticed. This would, in fact, be predicated by the fact that the foundry loss in these systems is generally less than in floor work, but I can go a step farther than this and say that molds may be subjected to what would be considered very rough treatment and yet suffer no damage, as I have repeatedly loosened up all connections on a mold conveyor and shaken the car conveying a mold with all my strength while it was being poured, banging the carriage against its supports hard enough to slop the iron out of the sprue and found no apparent defect by sufficient commercial test in the casting.

The casting made in these molds was a hollow casting of varying lengths and thin section poured from one end, the core held by a pivot at one end only, resting upon wire chaplets bearing against tin "spots" in the core for the remainder of its length.

I am familiar with mold conveyors in which the carriage is suspended from an overhead track and allowed to swing free except at the point where the pouring is done and no trouble is experienced by damage to the molds. A gain is in fact made by building a mold conveyor in this way as less power is required for driving it, less wear is entailed, and the supporting frame work is cheapened.

I have learned of a continuous foundry in which the molds when made are carried to the cupola upon trucks provided with springs, poured and then carried on to a cooling and dumping point and I am advised that the loss in this

foundry is less than it was when the same molds were poured upon the floor by bringing the iron to them.

Cupola Operation.

The operation of the cupola was also touched upon. My experience goes to show that this is perhaps the most easily managed function of the whole system since, if the blower—and I think the positive blast blower is best for the purpose—be driven by a direct connected engine with its valve easily accessible from the pouring platform, great variations in melting speed may be obtained with little detriment to the quality of the iron, and by thus handling the blower and having means of communicating at the same time with the charging floor, the cupola may be easily held for considerable periods, such as for changing patterns, etc., etc., and operation started immediately when desired. I have spoken of stopping for changing patterns on purpose, as there is little need for extended stops on any other account, as a suitably designed system will operate on less than 2 per cent. loss of running time from accidents.

The cupola is preferably run with an eye to the production of castings rather than the saving of coke, but this, of course, settles itself and a ratio develops itself which may easily be as high as the best cupola practice affords. Mr. Sleeth has told you, in fact, that his is between 10 and 11 to one. It is much better, though to produce castings than try to save coke.

I am a little surprised to find among foundrymen, otherwise so well informed, an impression that this continuous method is in an experimental stage. Nothing could be farther from the fact, as the method is so aged that the "Mother" patents upon it have expired, and the former owner of them, who is here, has just told me that his original system has been running for eighteen years, and is still in use. I had the privilege of building quite a complete plant some six years ago for his company, in which three systems were installed, one entirely continuous and two intermittent, that is, in one the molds are carried, and in the others, only the sand is handled by conveyors, the molds being poured on the floor from iron brought on overhead tracks, and these systems have been in continuous operation. His company is now building a foundry containing four continuous systems. My own experience with this method began ten years ago with a system which was put into successful operation.

Mr. Sleeth's has been running for undoubtedly fifteen years, perhaps longer. I am familiar with it for about twelve years, and there are a sufficient number of others in successful and every day operation to put the scheme entirely out of the class of experiment.

There have, of course, been some attempts which have been notable failures, several systems having been devised and installed by builders of conveying machinery, who have attempted to handle molding sand as they would other and very different materials, and who have not had a sufficiently adequate comprehension of the comparative relations of the foundry operations involved, and on the other hand, many capable foundry men have designed systems which they have tried to make too automatic. I can recall one generally on the lines of Mr. Custer's design, but which failed through not having his permanent mold.

He has put the continuous method very far forward and is entitled to great credit for his success.

Elasticity is very essential in every function in the continuous method with the sand mold and plenty of "elbow room" where the different operations are brought together.

Finally then it appears to be demonstrated by the considerable number of successful systems in use that by means of mechanical handling systems in the foundry the efficiency of the workman is increased from 10 to 50 per cent. (this increase having been duly charged, with what additional non-productive labor is necessary), the average wage can often be reduced somewhat, the foundry loss is decreased, the floor space reduced sometimes by as much as one-half, this also taking account of necessary additional power plant, etc., and by mechanical handling only, can the full capacity of molding machinery be realized.

The increase in capacity available from molding machinery is considerable, even though sand handling machinery only be employed, as in some classes of work, sand handling machinery only is possible, malleable work for instance, in which the melting is done in the air furnace, while investment charges are not seriously increased when the saving in equipment due to increased efficiency is considered.

DIFFERENTIATION OF STEELS.

Bermann (Zeitschrift des Vereins Deutscher Ingenieure) finds that the sparks emitted by the different kinds of steel when ground on an emery wheel afford a means of differentiation. For instance, the sparks from carbon steel take the shape of spiny tufts, the number of spines increasing with the carbon content. In manganese steel the individual rays of the tuft exhibit terminal branchings, whilst in tungsten steel the individual rays are difficult to detect, except that the ends show decided nodes. The sparks themselves consist of particles of metal abraded by the emery granules, which have become heated to whiteness or even above the melting-point partly by the oxidation of the iron, carbon, and silicon, but chiefly by recalescence through the conversion of the contained carbon into different modifications.

ORDERS AND EXPECTATIONS.

The machine-shop foreman rushed into the foundry just as the iron began to come down. His words were few for time was scant.

"I want a casting in an awful hurry and I want it bad. I've had a breakdown. Put someone at it who knows how to get a move on."

He got what he asked for. The casting was bad enough to please anybody who wanted that kind. For all that, he was not satisfied. Some people don't always say what they mean.

NON-SHRINKING ALLOY.

A non-shrinking alloy, according to The Metal Industry, is composed of the following: Tin, 50 lb.; zinc, 50 lb. This gives a tough, hard metal that runs well if a good grade of zinc is used. The addition of 2 pounds of bismuth will render it even more fluid and enable it to be poured at a lower temperature. By using heavy sprues and pouring cold the shrinkage, which is slight, may be to a very large extent overcome.

LARGEST LOCOMOTIVE IN CANADA

The largest locomotive ever manufactured in Canada has gone west over the C. P. R. to work on the company's grades in British Columbia. This engine was constructed in the Angus shops at Montreal, and was especially designed as a type for a series of large engines particularly adapted for heavy grades. This engine can pull an ordinary freight train of 1,140 tons over a 1 3-5 per cent. grade with ease, while any engine now in use would have to take a similar train over this grade in two sections or else use two engines.

It has been estimated that a square foot of uncovered pipe, filled with steam at 100 pounds pressure, will radiate and dissipate in a year the heat obtained by the economic combustion of 398 pounds of coal. Ten square feet of bare pipe corresponds aproximately to two tons of coal per annum.

Growth of the Canadian Iron and Steel Industry

Eight Years' Progress, Showing the Output of Iron and Steel, Enlargement of Plants, the Increased Market, and the Future Outlook.

By T. J. DRUMMOND*

The early part of 1909 was naturally lean, but as the months went by and people began to realize that they were more frightened than hurt, confidence grew, and buyers began to come into the market. Construction projects that had been held back were taken up again and from the second half of the year, confidence has grown day by day, and, notwithstanding the early slackness, I believe that the production of pig iron—the base of all iron and steel work—has reached its high-water mark in Canada at the close of 1909, with an output of about 800,000 tons.

It is best to commence with pig iron. While a total annual production of 800,000 tons of pig iron may seem insignificant, still from a Canadian point of view it is satisfactory as an evidence of growth in the face of the many initial difficulties, and as a promise of the future.

Prior to 1900 Canada's necessities in pig iron and steel had been to a very large extent cared for by import from the United States, Great Britain, Germany and Belgium. Honest attempts had been made by private efforts and Government encouragement to establish the industry, starting (as it should, to be successful) from the ore up, and while in the base industry very little progress was apparent, it was the pioneer work of the late years of the 19th century that has made possible the success of the first decade of the 20th.

Canadian Pig Iron Record.

In no single year up to and including 1900 had Canadian blast furnaces produced as much as 100,000 tons of pig iron, and the steel production had been less. In 1895 only 37,825 tons of pig iron were produced in Canada, and the year 1900 showed only 86,090 tons, an advance, it is true, but a very slow one. With the growth of confidence in Government encouragement, advancement became more apparent, old works were enlarged, and new plants installed, notably at Sydney, Sault Ste. Marie, Hamilton and Midland. 1901 showed a production of 244,976 tons of pig iron, and 1902, 319,557. Since then the growth has been steady, and we find 1907 showing 651,962 tons, 1908 (an off year), 630,835, and, as already stated, it is expected that the 800,000-ton mark will be reached when the figures of 1909 are totaled.

Plants Being Enlarged.

With confidence in the future of our country, we of the iron industry are continuing to develop and extend our operations. Important additions are now being made to the blast furnace plants of the Dominion Iron & Steel Co., Sydney, the Lake Superior Corporation, Sault Ste. Marie, and the Canadian Iron Corporation at Midland, which will bring the capacity of the Canadian furnaces up to about 1,250,000 tons of pig iron per annum before the close of 1910, and in 1911, with these new plants in operation, we should have a production of at least that quantity.

That there is warrant for these additions is evidenced by the fact that, notwithstanding the increase in Canada's production, pig iron continued to be purchased abroad in large quantities, 1908 showing 207,053 tons as having been imported.

While pig iron is naturally the barometer by which a country's position in the iron and steel industry is judged, still, it is interesting to note what is happening in some of the more finished products of iron and steel.

The Steel Production.

Previous to 1900 Canada produced less than 100,000 tons of steel per annum, and the first considerable advance came with the opening up of the Sault Ste. Marie rail mill in 1904, quickly followed by that of the Dominion Iron & Steel Company's mill at Sydney. Prior to 1904 steel rails for steam railway purposes were on the free list. The Government had, however, in 1903 taken power to direct, by order in Council, that a duty should be imposed on rails when the Governor-in-Council was satisfied that rails of the best quality were being made in Canada in sufficient quantity to meet the ordinary requirements of the market. In 1904 the Algoma Steel Company demonstrated at the Soo that these requirements were being met, the duty went into force, and Canada made its first great stride in the increase of steel production. In 1902 we had imported 179,591 tons of rails, and in 1903, 203,751 tons. Since 1904, however, the two Canadian mills have cared for all rail requirements, which at present mean about 350,000 tons per annum.

Ingots, blooms and billets still are imported in moderate quantities, but the Canadian steel industry is gradually overhauling the demand. In the face of the increasing market, in wire rods the imports have decreased from $792,078 in 1905 to $295,122 in 1908, and when the new rod mill is installed at the Soo Canada will be able to care for its full requirements in this important article. On the whole the growth of steel production in Canada is as marked as in pig iron. With less than 100,000 tons before 1900 we produced 706,782 tons in 1907, and in the poor year of 1908, 588,763, and will probably reach the 800,000-ton mark before the close of 1909.

In comparing the total production of steel with that of pig iron it may be well to point out that in the manufacture of steel varying quantities of steel and iron scrap are used in conjunction with pig iron, so that, while the production of pig iron and steel is to-day practically equal in tonnage, a considerable portion of pig iron produced goes into the foundry trade, which has made almost as great progress as the steel industry.

Growth of the Market.

To capture the growing trade new and larger mills must be erected to care for the heavy structural and other sections, plates, etc. The extension of the tariff so as to give equal protection on the heavier sections to that now afforded the lighter ones will help towards an increase in home steel production, and it seems safe to assume that this will be done either by extending the clauses now, or by the Government following the same procedure as in the case of steel rails, i.e., by providing for the extension of clauses when the heavier sections are being made in Canada. With this in view the Lake Superior Corporation is erecting at Sault Ste. Marie two mills, which should be in operation by 1910, and which, under favorable conditions, should add materially to Canada's output of steel.

Future of the Industry.

In the future of the industry I have every confidence. With increasing confidence, the demand for our products will increase. Natural conditions are daily improving through the discovery and opening up of iron and steel deposits, and we are also being greatly aided by the influx of new capital, especially from Great Britain, and the growth of the knowledge not only in Canada, but abroad, that the iron and steel industry of Canada is making good.

*President of the Lake Superior Corporation.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

The Toronto Wire Nail & Tack Co. will erect a $4,500 factory.

The National Wire Co. has purchased a factory site at Toronto.

Jack & Hay, machinists, Dauphin, Man., are succeeded by J. H. Johnston.

The Reddington Rock Drill Co., St. Catharines, has obtained a charter.

The Munro Steel & Iron Works, at Winnipeg, were damaged by fire recently.

The Kingston Shipbuilding Co. is planning to erect a repair shop, costing $150,000.

The Dominion Corrugated Steel Pipe Co., St. Johns, Que., has been incorporated.

Chas. A. Colville, machinist, Hamilton, has sold his business to Rothwell & Hall.

Quality Beds Ltd., Welland, will enlarge this car, greatly increasing their capacity.

The R. Watt Machine Works, recently burned at Ridgetown, will rebuild at Chatham, Ont.

The Verity Plow Co., Brantford, will erect an addition of 100 feet to the foundry department.

A big company is being formed at Sussex, N.B., to manufacture the Acme steel ladder on a large scale.

The Canadian Safe Co., recently incorporated, for the manufacture of office safes, is looking to locate at Windsor, Ont.

The Bain Manufacturing Co., of Welland, are perfecting plans for the addition of an automobile factory to their plant.

The Michigan Central Railway has in contemplation the early erection of new shops and roundhouse at St. Thomas.

The six-storey factory of the Munro Steel & Wire Works, at Winnipeg, was badly gutted by fire on January 12, loss $60,000.

Port Dover has voted unanimously to give assistance to the Widespread Implement Co., the vote being 198 to 0 in its favor.

Plans are being prepared for an annex to the pipe shop of the Canadian Iron Corporation at Port William, to cost approximately $50,000.

The Disston Saw Works at Toronto have moved their factory and office from Adelaide Street to their new premises on Fraser Avenue.

Fire which broke out in the cupola of a furnace of the Canadian Iron & Foundry Co., Montreal, did damage to the extent of some $10,000 early in January.

The Canada Iron Corporation have definitely decided to rebuild their iron pipe foundry, which was completely destroyed by fire about two months ago at Three Rivers.

Samuel Trees & Sons are rapidly pushing along the repairs to the Fraser Foundry at Whalley, preparatory to reopening the industry.

The Armbrust Canadian Brake Shoe Co. have purchased some land at Toronto. They purpose building a factory, and operations will start at once.

The Cossitt Co., makers of harvesting machinery at Brockville, sustained some loss through fire at their premises about the middle of January.

The new C.N.R. roundhouse at Ottawa, will be finished shortly when a complete mechanical equipment capable of handling twelve engines, will be installed.

Chas. Pickard, Chas. W. Fawcett, (both stove manufacturers of Sackville, N.B.,) and others have formed an electric machinery and development company at Sackville.

Welland has granted a fixed rate of taxation of $10,000 to the Electro Steel Co. This plant is now under construction and will be as an experimental plant before erecting a larger one.

H. H. Smalley, Hartland, N.B., has taken over the farm machinery business of Hagerman & Baird, together with a lease of their large hall, and will conduct a general machinery agency.

It is understood that the Dominion Iron and Steel Co. will add a plate mill to their establishment at Sydney, the product to enter into the construction of war vessels to be built at Montreal and Halifax.

A company capitalized at $150,000 has been formed in Vancouver to manufacture the automatic car fender, crude oil burner, automatic dump car release and other inventions of Henry Clay Jordan, of Vancouver.

A building permit has been granted to the Canada General Electric Co. for the erection of a large brick warehouse at Vancouver. The structure will cost over $30,000. Murray & McMillan are the contractors.

The Lee Mfg. Co., Pembroke, manufacturers of incubators, refrigerators, kitchen cabinets, etc., have purchased a foundry and will take up the manufacture of stoves and ranges. Patterns are now being prepared for next fall's trade.

According to the terms of a contract just closed Windsor will add a third automobile factory to its list of industries with the next two months. All tne companies are branches of Detroit concerns.

The Grand Trunk Pacific Dock Co., with a capital stock of $150,000, has been organized in British Columbia to undertake the construction of the new docks at Seattle, Victoria, and additional docks at Prince Rupert.

Partridge & Son, of the Crescent Wire Works, Kingston, are to establish a plating department doing all kinds of silver, nickel and gold plating. The new plant is being installed, and will be in operation within a couple of weeks.

The B.C. Marine Railway Co. are making arrangements to greatly enlarge their shipbuilding plant at Victoria. Capital has been subscribed by English financiers and the enlargement of the works is considered practically assured.

A charter has been granted the International Dredge & Dock Co., Toronto, capitalized at $50,000, to manufacture and deal in machinery and supplies. W. A. Lydon, W. Cahill, and H. C. Wild, all of Chicago, are provisional directors.

Swan & Hunter, the great English shipbuilders are said to have purchased a site at Dartmouth, N.S., and that they will spend a million dollars on a plant there. In one year's time they expect to be able to construct first class cruisers as well as merchant ships.

The Canadian Car & Foundry Co., Montreal, elected the following directors recently: N. Curry, president, James Redmond, chairman of the executive; H. S. Holt, Geo. E. Drummond, I. H. Benn, T. J. Drummond, executive; W. W. Butler, first vice-president; N. S. Reder, second vice president, and W. M. Aitken, executive.

The boiler and machinery have been installed by the Schaake Machine Works of New Westminster, in the new steamer which is to run on Lake Harrison for the Brooks-Scanlon Lumber Co. The machinery for the Paystreak, made by the same company, is now ready and it will be installed as soon as the boat is brought to the works.

Citizens of Sydney voted almost unanimously in favor of the establishment of rolling mills there. Construction of the buildings will, it is expected, start early in April, and the amount to be expended by the company will not be less than $550,000, while the amount to be expended during the construction in wages will be in the vicinity of $150,000. The plant will employ about 500 men.

The municipality of North Vancouver has agreed to guarantee the interest on $200,000 of debentures of the Imperial Power Shipbuilding and Dock Corporatian, for a period of ten years, and will exempt the company from taxcation for a like period. The company agree to spend the sum of $300,000 on construction and plant alone. The manufacture of railroad cars will be undertaken.

Justice Clute made an order at Toronto a fortnight ago staying the winding-up proceedings ordered on September 8 last in the matter of the Atikokan Iron Co., and discharging the liquidation. The stay was asked by Mackenzie & Mann, who are large shareholders, and say they have secured sufficient to pay off all the debts.

George T. Rosselle, of Cincinnati, acting on behalf of Geo. H. Paine, a Cincinnati capitalist, has completed the purchase of the stock and machinery for the manufacturing of the Sunlight gasoline light from the Sylvester Mfg. Co., Lindsay. A company for the manufacturing of gasoline lighting and heating devices exclusively will be organized and an industry started in Canada.

The machinery for the Modern Malleable Range Co.'s stove and range factory, which will shortly start operations at Chatham, Ont., is being shipped in from Leamington and will be installed in the premises formerly occupied by the Chatham Motor Car Co. These buildings will be used till the completion of the proposed large factory, the contracts for which are now in the hands of John Piggott & Sons.

George McCrae, superintendent of the Goold, Shapley & Muir factory, Brantford, was in Dunnville recently, endeavoring to form a stock company for the manufacture of gas, gasolene engines and mining machinery there. The town is being asked for a loan of $30,000, and the citizens of Dunnville are being asked to subscribe $25,000. The company will employ 50 hands to start, and eventually 100 hands.

The Blair Engineering Co., which is opening a branch at Montreal and which has a capital of $100,000, is handling an invention which is being installed in open-hearth furnaces in several steel companies in the States, and is being inspected by Canadian concerns. The directors are William Johnson, Alfred La Rocque, Michel Benot, Thomas G. Blair, jr., J. S. Andrews and Roswell F. Munday, of Chicago. The American company has shown large profits.

Charles McDonald, manager of the St. John Iron Works; Stanley E. Elkin, of the Maritime Nail Works, and James Pender, of James Pender & Co., wire nail manufacturers, visited Ottawa recently to meet the railway commission. They protested against an increase in the C.P.R. freight rates on iron, steel and wire nail, shipped from St. John to points in Central Quebec.

It was claimed that the increase wa unwarranted. The commission after hearing the delegation announced their decision to have the old rate restored.

The annual meeting of the shareholders of the Goold, Shapley & Muir Co., manufacturers of gas engines, windmills, etc., was held recently, when the officers elected were: E. L. Goold, president; W. H. Shapley, vice-president; John Muir, manager; W. H. Whitaker, secretary, and Henry Yeigh, treasurer. In order that they may cope with the demand for the new gas traction engines, plans have been drawn up, and tenders asked for up-to-date engine and machine shops, 180 x 50, 180 x 50, 32 x 50 respectively, which will be modern in every respect.

The Vulcan Iron Works, New Westminster, have arranged with the Willamette Iron Works Co., of Portland, Ore., whereby the former company will make all the boilers for locomotives built by the American firm for use in Canada. The Willamette Co. has found it impossible to manufacture at its plant in Portland boilers to meet the requirements of the B.C. Boiler Inspection Act and make any profit after paying duty into British Columbia. This means a big business, as all the large lumbering and logging concerns use locomotives and many that are now ordered will have their boilers built at New Westminster.

The by-law authorizing an agreement between Fort William and the Superior Rolling Mills Co. was carried by the ratepayers at the municipal elections early in January. This means the establishment at Fort William of what is believed will develop into one of the largest plants in Canada. According to the agreement, the company is to erect a thoroughly up-to-date wire and nail factory, employing at least one hundred men for 250 days in the year at ten hours each day. The names of those to the agreement are: F. W. Thompson, managing director of the Ogilvie Co.; H. S. Holt, president of the Montreal Light, Heat & Power Co., Montreal; T. Drummond, vice-president of the Dominion Steel Corporation; W. T. Phippen, general counsel of the Canadian Northern Railway; W. A. Black, Winnipeg, western manager of the Ogilvies.

Municipal Enterprises.

Montreal council has been asked to vote $1,000,000 for a filtration plant.

Nanaimo ratepayers will vote on a by-law to raise $100,000 for a sewerage system.

The Works Committee of the Regina city council recommend the spending of $363,000 on a trunk sewer.

At a recent meeting of the Hull city council the tender of the William-Hamilton Co., Peterboro, was accepted for the pumps and water-wheel, for which tenders were sent in at the last meeting of the council. The price to be paid for the pump is $14,850 and $2,065 for the water-wheel.

Contracts for the annual supplies required by lets at 30 cents each; James Robertson Co., granted to the Dominion Sewer Pipe Co., for sewer pipe; N. L. Piper Ry. Supply Co., metal house numbers; McClary Mfg. Co., street tablets at 38 cents each; James Robertson Co., lead pipe, at $5.29 per hundred pounds; Canada Metal Co., brass and bronze castings; Canada Foundry Co., cast iron pipe (12-inch), at $16.75 per length; hydrants and stop valves, Gutta Percha Rubber Mfg. Co., and Dunlop Tire & Rubber Goods Co., rubber valves; Keith & Fitzsimons Co., Somerville, Ltd., and Dean Bros., brass work for house services; Reid & Brown, iron valve and stop cock boxes, and special castings at $2 per hundred; Portland cement, National Portland Cement Co., $1.57 per 350 lbs. net.

Structural Steel.

A bridge will be built over the Lottridge inlet, at Hamilton, at an estimated cost of $2,000.

The Ontario Iron & Steel Co., of Welland, has given a contract to the Hamilton Bridge Works Co., to build an extension to its plant, 170 by 50 feet.

There will be about 25 bridges erected along the proposed 200-mile extension of the Algoma Central Ry. One of these bridges will cost in the neighborhood of $25,000.

D. E. Easson, of Peterborough, one of the staff of civil engineers on the Trent Canal, took final measurements for the steel superstructure of the contemplated Wellington Street bridge at Lindsay.

At a meeting of the Vancouver bridge committee it was decided to tender Waddell & Harrington, of Kansas City, $28,000, to cover all engineering expenses in connection with the Cambie Street bridge. This will cover inspection of plans, field work, direction of work, etc.

The contract for clearing the debris of the Quebec Bridge from the south shore has been awarded to Captain Charles Koenig and Co. The contract specifies that the clearing of the debris must be finished by May 1 next, when R. and J. G. Davis will begin the reconstruction of the piers.

F. W. Holt, C.E., in his report on the harbor bridge project at St. John, figures the cost of a satisfactory bridge at $749,577. Mr. Holt says, as designed, the bridge is intended to have a 32 foot highway and an 8 foot sidewalk 25 feet above railway track and two street railway tracks on the same level. The three tracks are side by side inside of the trusses to simplify the counter-balancing of draw.

Two engineers of the Cleveland Bridge and Engineering Co., of Darlington, Eng., J. H. Walker and J. R. Dixon, are in Quebec looking over the site of the big bridge, with the intention of putting in a tender for the work on behalf of the company they represent. The Cleveland Bridge Co. is one of the foremost concerns in England and has carried out a large number of big engineering works in England, India, Africa and other parts of the world.

The substructure of the C.P.R. bridge at Edmonton will cost $500,000. Plans have been prepared for the bridge which will connect Strathcona with Edmonton, and a deputation has gone to Ottawa to solicit the aid of the Dominion Government in bearing the expense. The structure will cost about a million and a half, of which sum the C.P.R. will pay nearly a million but the balance has to be raised by the city of Edmonton and the Governments. The bridge will be 2,687 feet long and 166 feet high.

The Dominion Bridge Co. has commenced active work on the erecting of the four new steel spans which will complete the Fredericton-St. Marys Highway Bridge. The first shipments of steel have arrived from Montreal and the travelers to be used in the work of erection have also arrived. The largest travelers are over 50 feet high, being somewhat higher than those used on the bridge heretofore. Superintendent McMahon has a crew of men coming here from a job near Bathurst and will have about fifty men employed on the work. The contract calls for the four spans to be ready for traffic by April 1st and it is the biggest contract of the entire superstructure.

Electrical Notes.

The office of the Dufferin Light and Power Co., at Orangeville, was burned on Jan. 9.

New tenders for electrical equipment for the London power station will be called for.

The Lethbridge city power plant was totally destroyed by fire on Jan. 2, rendering the city without light or water.

In Paris, the by-law for taking the first steps with a view to securing Hydro-Electric power, carried by a large majority!

The Northwest Battery Co., Winnipeg, will instal the lighting plant at Moose Jaw. G. K. Watson will superintend the installation.

The International Contract Co. is now engaged in installing a motor at the new Lulu Island bridge at New Westminster for the purpose of operating the swing span by electric power.

The new centre for Hydro-Electric power that will be created as a result of the favorable votes in Brampton and elsewhere, may mean a considerable reduction in the price of power to Toronto itself.

It is almost certain that the Calgary civic power and light plant will be moved during the year. The increasing business necessitates the extension of the plant and a change of site must be made.

The addition the city of Kamloops is making to its lighting plant will give that city the largest and most complete lighting system in the interior of British Columbia with one exception, that of Nelson, B.C.

The Canadian Niagara Power Co. intends erecting a power plant at Bridgeburg; the value of the plant to be $60,000; well equipped with transformers, switches and distributing circuits, to be erected in the early spring.

J. N. Winslow, who was appointed by the New Brunswick Government to look into the value of the power of Grand Falls, has placed the same at $300,000. It is stated that an American syndicate is seeking to acquire the power.

The work of preparing the ground in the rear of the Westminster Avenue car barns, at Vancouver, for the erection of a steam auxiliary plant for the B.C. Electric Railway Company, is being hurried forward as rapidly as possible.

City Engineer Ker, of Ottawa, at the recent meeting of the waterworks committee made the proposition that the city should generate its own electricity for the booster it is proposed to instal to raise the water pressure for fire purposes.

Two carloads of machinery for the new unit at the city's power plant at Upper Bonnington Falls have arrived at Nelson. Another car was reported at Cranbrook. A. C. Read and Mr. Johnson, of Montreal, machinery experts, are there to inspect the installation.

C. H. Colgrove, M.E., hydraulic expert, has decided on a point on the Saskatchewan river about 110 miles from Edmonton as the source of power for that city. Minimum power is estimated at 20,000 horse power. The proposition is now being investigated by a group of hydraulic engineers.

Another 10,000 horsepower unit will be installed at the Canadian plant of the Canadian Niagara Power Co., at St. Catharines, making the sixth of that type. The generator has been ordered from the Canadian Westinghouse Co., at Hamilton, and will be delivered so that it may be assembled in the spring. The turbine will be delivered by the Bethlehem Steel Co.

A special committee of the Sherbrooke City Council has made a recommendation that the city buy the drop-off power on the Magog river and also the dam at the outlet of Little Lake Magog from the British American Land Co. They set the price at $8,000. This property is required or will be required shortly by the city for more power for the electric light plant.

The B.C. executive council has granted the request of Prince Rupert citizens for an advance from the provincial treasury of a sum of $50,000 for the acquirement of the pole line of the Prince Rupert Power & Light Co., and for the construction and installation of proper buildings and plant for the supply of electric light and power to Prince Rupert users of these modern essentials.

An interesting feature in connection with the operation of the lumber mills of the Fraser River Lumber Co. in New Westminster is that they have found that too much power is lost by friction, and it is the intention to instal separate motors to be operated by electricity, wher-

ever possible in connection with shingle machines, etc. Many of these motors have already arrived and will be installed immediately.

There is some talk in Levis, Que., of the possibility of the municipality purchasing the Dorchester Electric Co., which is capable of developing 1,000 horse-power. The Dorchester Electric Co. recently obtained the right to enter Levis, and in some circles the idea of purchasing has been developed with a view to opposing the Canadian Electric Co., which has just passed over to the Quebec Light and Power merger.

As a result of the remodelling and rebuilding of power house No. 2, better known as the "Old Standard," on Amelia Island, at the Chaudiere, the Ottawa Electric Co. will be able to double the amount of power hitherto generated there. New machinery throughout is being installed and the water level in the flumes is being raised from 22 feet to 28 feet. Formerly only 2,000 horse power was being developed at this point.

The total earnings of the Nelson light and power department, in 1909, were $52,237.20, and the expenditures $16,651.97, leaving a balance of $35,585.23, from which have to be deducted interest on debentures and sinking fund. During the year 100 new connections were made, and the city council is now supplying 80 per cent. of the business houses, 95 per cent. of the residences, and practically all the manufacturing establishments in Nelson.

Citizens of Melville, Sask., voted on an electric light by-law on Jan. 4, the result of the poll being 60 for the by-law and 8 against. This by-law gives Cushing & Weir a franchise, but not an exclusive one, to erect an electric light and power plant in Melville for a period of ten years, when it may be purchased by the town. Work will be commenced at as early a date as possible, and the plant has to be in operation by July 1. Its cost will be in the neighborhood of $30,000.

Three gentlemen representing the Shuswap Falls Light & Power Co. are negotiating with the Armstrong, B.C., council for the purchase of the town's electric light plant. The company represent their plant as being capable of supplying light for the whole valley from Penticton to Sicamous. The company will sell light at 10 cents per k.w., whereas the people are now paying 16 cents: Another proposition by the company is to connect Enderby, Armstrong and Vernon with Grande Prairie and Salmon River by means of a tramline.

The appointment of J. E. Aldred, president of the Shawinigan Water & Power Co., as director of the Montreal Light, Heat and Power Co., follows on the purchase of 3,000 shares of Power stock, a short time ago, by Shawinigan. The election of J. E. Aldred recalls rumors of a merger between Shawinigan and Power, but no significance is placed in the choice. There is no doubt, however, that Mr. Aldred's appointment will lead to closer relations between the two concerns, with possible ultimate merging of interests.

The application of the Burrard Power Co. for the right to erect a dam at the lower end of Lillooet Lake, B.C., in the railway belt, for the purpose of raising the water in the lake and by diverting the water to a power house to be erected about four miles down the Lillooet River from the lower end of the lake for the purpose of generating electric power, this to involve the right to use 25,000 miner's inches of water in the lakes, has been approved by the executive council at Ottawa. The minimum amount of expenditure to be made in connection with the works annually during the five-year agreement is $25,000, and the water power to be developed 3,000 horsepower.

For inside wiring at the Montreal electric power house the order went to O'Leary & Co., who secured the contract at $205, the same firm were also awarded the contract for electric piping for generation purposes and for exciter leads at $145. For the supply of two circulating pumps, it was decided to award the contract to Laurie & Lamb, at $2,300, it being represented that the pumps on offer by that firm were more economical in steam consumption, and that the saving in fuel in one year would almost compensate for the difference in price. Garth & Co. will provide the necessary pipe and fittings at a cost of $1,029. For a boiler supply the recommendation was for a 250 horse power water tube and the order was awarded to Polson's Iron Works at $4,615.

The new auxiliary steam plant recently installed at Victoria by the B.C. Electric Co., on the foreshore at Rock Bay opposite the old plant which has been yearly put in operation to meet the demand for power has been given its first practical test. By the installation of the new plant the B.C. Electric Co. has increased its ability to deliver electricity for power, light and heat by 1,000 horse power at an expenditure for building and plant of about $62,000. The machinery was formerly in use in Vancouver and was installed to give the added power needed consequent of the probable failure of the water power at Goldstream which in past years has overtaxed the old steam plant. For this year the new plant will be used solely as an auxiliary in case of necessity. Until the Jordan river plant is running the new plant will be practically kept constantly in use after this year. The company now has a total horse power of 4,400, of which 3,400 can be secured from Goldstream and the old steam plant and 1000 from the new plant, the largest amount of power in the history of the company here.

Planing Mill News.

J. W. Molson is building a large sawmill at Shawbridge, Que.

D. E. Wallace, of Thamesville, Ont., is making further additions to his sawmill.

A new sawmill is being built a short distance in the rear of the Markdale, Ont., furniture factory.

The Beaver Mfg. Co., Buffalo, makers of wood fibre material, contemplate establishing a branch factory at Ottawa.

It is expected that the Northern Oil Co. will establish works at Victoria, and will also build large wharves and a cooperage and box factory.

The C. C. Manuel & Sons Co., of Richford, Vt. is building a plant in Sutton, Que., for the manufacture of butter dishes, clothes pins and veneers.

Hugh Baird & Sons, formerly of Markdale, Ont., now at Thornbury, Ont., are again entering the lumber business in the spring and expect to put up a new band saw mill of the best fireproof construction.

The Watts Manufacturing Co., of Wattsburg and Proctor, in the Kootenay district of British Columbia, are installing a wire-wound wooden pipe plant in connection with the Proctor mill. The plant is nearly ready for operation.

Statistics of the lumber industry in British Columbia show that the total number of saw mills is 204; capacity, approximate average, 8,080,000 feet a day; shingle mills, 45, with a capacity of 2,250,000,000 yearly; logging camps, 265; donkey engines and logging locomotives, 267; horses employed, 1,500; men employed, 17,000.

Seaman, Kent & Co., hardwood finishers, will erect a plant at Fort William, which will employ 100 men and will ship to the west the first year 500 carloads of finished material and 800 carloads a year afterward, provided the city will exempt them from all but a nominal tax. The proposition will be submitted to a vote of the citizens.

Negotiations for the sale of the Canadian Pacific Lumber Co.'s mill at Port Moody, reputed to be the most scientifically constructed lumber manufacturing plant in British Columbia from the point of view of low cost of operation, are now proceeding between the owners and Meredith and Irwin, who are largely interested in the Anglo-American Lumber Company, of Vancouver.

J. R. Booth, Ottawa; the E. B. Eddy Co., Hull, and the James Maclaren Co., of Buckingham, are taking out enough pulpwood to keep their mills running to the fullest capacity in preparation for what promises to be a good season. Mr. Booth is increasing the capacity of his pulp producing plant by 60 per cent. and expects to use all its output in the manufacturing of paper.

Railway Construction.

The Calgary Street Railway will build an extension of about 12 miles during 1910.

A $2,000,000 electric railway will be built in the Okanagan valley of British Columbia.

The C.N.R. line will be extended to Athabasca Landing, thirty-six miles from Morinville, Alta., the present terminus.

Surveying between Port Colborne and Fort Erie along the lake shore for that branch of the N. St. C. & T. Ry., is now going on.

Three hundred and fifteen thousand dollars will be expended on the New Westminster branch of the British Columbia Electric railway during 1910.

Tenders are now being called for the construction of the V., V. & E. line between Abbotsford and Hope, B.C., a distance of 78 miles, and between Princeton and Tulameen.

A party of G.T.P. surveyors will locate the line from Yorkton, Sask., to the Pass, at which point the G.T.P. will make connection with the Government road to either Churchill or Nelson.

There is a project on foot at Vernon, B.C., to build a tram line through the Okanagan valley from Enderby to Penticton and Summerland to handle the rapidly developing fruit and produce business of the district.

A spur line running west from the C.V.R. branch of the Dominion Atlantic Railroad, at Kentville, N.S., will be built. The Provincial Government will give a subsidy of $3,200 per mile and the Federal the same.

It is proposed to build a six-track subway from the eastern end of Montreal to the western, taking in all the railway stations, etc. English capital is behind the move, which will take in the street railway and power companies, and necessitate an investment of a hundred million dollars.

A new electric railway running northward from Toronto to Barrie, with branches to Orillia and Owen Sound via Meaford, is being organized by Toronto capitalists, and application will be made for a charter at the next sitting of the legislature by W. H. Price, acting for the promoters.

A report from the Soo says that in February the Algoma Central Railway Company will call for tenders for an extension of their railroad 200 miles. It was also stated that the sum of $3,000,000 was being allowed in the estimates for this purpose. In the extension 64 bridges will be constructed.

The charter granted to the Northern Empire Railway Co. and the Manitoba and British Columbia Railway Co. has been transferred to a new company headed by Henry Roy, a millionaire. Capitalization, $4,500,000. Among the projects is a line through Peace River Crossing into Dawson and another east from McMurray to Fort Churchill on the Hudson Bay.

To meet demands of the various parts of its extensive system, the B.C. Electric Railway will need over 100 freight cars and more than that number of passenger cars. Half a million dollars has been appropriated for this particular, and orders will be placed with manufacturers in the east. Not only that, but the shops at New Westminster of the company will be operated to

capacity, and every effort made to attend to business offering.

Officials of the Canadian Pacific Railway, in Winnipeg, have made an appropriation, providing for the construction of fifty miles of the Kootenay Central Railway this year. It is proposed to start work early in March at or near Wardner station on the Crow's Nest Pass Railway. Tenders will likely be called for early February. The new line will open up some fertile and agricultural fruit-growing districts in the interior, including the famed Windermere Valley. The route extends north through the Kootenay Valley and thence via the Columbia Valley to Golden, a distance of 160 miles.

The weather in the west has been so exceptionally fine that good progress is reported as being made by the builders of the Grand Trunk Pacific. Freberg & Stone, sub-contractors under Foley, Welsh & Stewart, are drilling a tunnel nearly 400 feet long near Omineca on the upper Skeena river. Construction work on the east end of the Grand Trunk Pacific, also owing to the unusually favorable winter, is still going on. Down in New Brunswick the rails have been laid from Cains river westward as far as Nappadoggan Lake, where in the heart of the great Miramichi forest a divisional point has to be established.

New Companies.

Caledonia Gypsum Co., Hamilton; capital, $150,000; to develop and work mineral lands. Incorporators, Henry Lewis, E. Rubenstein and E. J. Hunterí

Acme Vacuum Cleaner Co., Montreal, capital, $20,000; to manufacture vacuum cleaners. Incorporators, W. T. Cumming, A. J. Brown and F. G. Bush, Montreal.

John Miller & Son, of Winnipeg; capital, $25,000: to deal in and manufacture hardware, etc. Incorporators, T. W. Neelands, G. N. Broatch and F. W. Louthood.

Montreal Asbestos Co., Montreal; capital, $500,000; to mine, smelt and work asbestos. Incorporators, H. C. Organ, Q. E. Baxter and L. Normandin, Montreal.

The Franco-Canadian Mfg. Co., Montreal; capital, $20,000; to manufacture glass bottles and glassware. Incorporators H. Hubert, T. Lafleur, and L. Mercier, Montreal.

Canadian Safe Co., Windsor; capital, $100,000; to make safes and vault doors. Incorporators, J. E. Blackmore, Detroit; N. A. Bartlett and A. R. Bartlett, Windsor.

Alex. Bremner, Ltd., Montreal; capital, $200,000; to manufacture bricks, cement, tiles, drain pipes, etc. Incorporators, Alex. Bremner, A. W. Bremner and Geo. Benoit, Montreal.

The News Pulp & Paper Co., Montreal, has been incorporated with a capital of $1,000,000. The incorporators are: G. Cf Foster, J. T. Hackett, T. F. Coonan, all of Montreal.

The National Engineering Co., Montreal; capital, $20,000; to manufacture electrical and mechanical devices, etc. Incorporators, R. T. Hencker, A. H. Duff and W. S. Johnson, Montreal.

The Torrey Asbestos Machinery Co., Montreal; capital, $50,000; to make mining, milling and general machinery. Incorporators, C. G. Greenshields, A. C. Calder and R. E. Allan, Montreal.

Swansea Smelting and Refining Co., Toronto; capital, $100,000; to mine and treat ores and make articles of metals. Incorporators, A. E. Knox, C. F. Ritchie and J. H. Oldham, Toronto.

The Union Iron Works, Toronto; capital, $200,000; to manufacture all kinds of machinery and implements, hardware, etc. Incorporators, J. T. White, C. W. Widdifield, and J. H. Cavell, Toronto.

Canada Bolt and Nut Co., Toronto; capital, $2,500,000; to smelt ores, metals and minerals, and manufacture their products. Incorporators, E. G. McMillan, J. E. Riley and G. B. Strathy, Toronto.

Canadian Merchandise, Ltd., Toronto; capital, $5,000; to deal in novelties, household utensils, hardware and other merchandise. Incorporators, G. M. Kellam, R. Westwood and C. A. Bailey, Toronto.

The Courtright Stove Co., Courtright, Ont., capital $40,000, to manufacture stoves, furnaces, gas ranges and electric fixtures. Provisional directors, F. C. Watson, M. Sanders and H. W. Unsworth, Sarnia.

Rogers Supply, Ltd., Toronto; capital, $100,000; to take over the Rogers Supply Co. and make Portland cement and artificial stone. Incorporators, Alf. Rogers, J. W. Rogers and A. E. Stovel, Toronto.

The International Tool Steel Co., Toronto; capital, $750,000; to mine and treat metals, carry on a foundry and machine shop, and make tools. Incorporators, S. J. Kelly, Jas. Ross, Chas. Lehmann, Toronto.

The B.C. Gazette gives notice of the incorporation of the following companies; Powell River Paper Co., capital, $1,000,000; New Columbia River Co., capital $5,000,000; the Crown Shingle Mill Co., capital $25,000.

Universal Engineering and Mfg. Co., Montreal; capital, $95,000; to manufacture, import and export electrical and mechanical appliances and machinery. Incorporators, J. J. Campbell, J. D. Lachapelle and J. C. Dudley, Montreal.

Canada Pipe & Steel Co., Toronto; capital $100,000; to manufacture iron, steel and metals, and make tools, machines and repair and construct structural work. Incorporators, J. L. Ross, A. R. Bickerstaff and A. W. Holmstead, Toronto.

The Lafrance Improved Pipe Joints Co., Montreal; capital, $50,000; to manufacture and deal in saws, barbed wire, lead pipe, shot, locks, tools, white lead and paints, etc. Incorporators, J. Lafrance, A. Chagnon and L. D. Latour, Montreal.

Cartwright Automatic Press Co., Montreal; capital, $500,000; to engage as iron founders, mechanical engineers and to make printing presses and machinery and tools. Incorporators, J. W. Blair, F. J. Laverty and L. A. David, Montreal.

Baillot's Gas and Steel Machine Co., Montreal; capital, $45,000; to construct and operate steel plants and gas generators and engage in general foundry and machine work. Incorporators, L. J. Beique, A. Baillot, and A. Menager, Montreal.

The Eastern Electric and Development Co., Sackville, N.B.; capital, $250,000; to establish electric works and manufacture electric machinery, appliances, devices, etc., and to generate electric power for sale. Incorporators, Chas. Pickard, C. W. Fawcett, Sackville, and M. G. Siddall, Pt. Elgin, N.B.

The Blair Engineering Co., of Canada, Montreal; capital, $100,000; to take over the Blair Engineering Co., New York, and to make the Blair indestructible port and bulk head for open-hearth furnaces, as well as deal in machinery of all kinds. Incorporators, Wm. Johnson, A. La Rocque and M. Benoit, Montreal.

Martin Freres & Cie., Montreal, Que., have been incorporated with a capital of $100,000, to carry on business as manufacturers and dealers in timber, lumber, logs, sashes, blinds, boxes and woodwork generally; to own and operate timber limits, sawmills, sash and door factories and planing mills. Incorporators: T. B. Martin, F. Martin and others, all of Montreal.

POCKET DIARY FOR 1910.

The "Pocket Diary and Year Book for 1910," published by the Mechanical World, Manchester, Eng., contains considerable new matter, including an entirely new section on oil engines with notes on crude oil engines by W. A. Tookey, who has also revised the section on gas engines. Condensed notes on the design of centrifugal pumps have been contributed by B. M. Woodhouse, and a new section on ball bearings has been included. Among other additions are the following: Dimensions of marine boilers; tapers and angles; change wheels for cutting metric pitches; hobs for cutting involute gears; dimensions of ring-oiled bearings; emery wheel speeds, etc.

Canadian Locomotive Works.

The Canadian Locomotive Works recently completed an up-to-date power house and a new boiler shop. Plans have been drawn up for a new erecting and tender shop and a new foundry. These new departments will be equipped with modern machinery greatly increasing the efficiency and capacity of the plant.

International Harvester Co.

The International Harvester Co., Hamilton, have decided to spend $100,000 on enlarging their plant. A large addition will be made to the woodworking department. This will be followed by another building to be used for a machine and erecting shop.

Bolt and Nut Merger.

As announced in January Canadian Machinery, Lloyd Harris, M.P., Brantford, has been chosen president and T. H. Watson, Toronto, vice-president and general manager of the Canada Bolt & Nut Co., Toronto, the capitalization of which is made up as follows: Bonds, 6 per cent., 20 years, $1,000,000; preferred, 7 per cent., $1,250,000; common stock, $1,250,000; total, $3,500,000.

The companies included are the Toronto Bolt & Forging Co.; Brantford Screw Co., Gananoque Bolt Co., Belleville Iron & Horseshoe Co. The remaining directors are G. P. Grant, W. T. Sampson and James Bicknell. Shareholders are offered cumulative preferred shares, and in addition 25 per cent. bonus on the common stock.

1910 CALENDAR.

F. Reddaway, 56 St. Francois Xavier, Montreal, manufacturers of Camel Brand oak tanned leather belting distributed a large office calendar printed in two colors. An instalation of a belt outside is illustrated on the calendar.

Big Aluminum Wire Order.

The Aluminum Co., of America, has just been given a contract for 1,500,000 pounds of aluminum wire from the Hydro Electric Commission of Ontario. The wire is for the first of a great series of electric installations which will place that province in the front rank as a section for the distribution of cheap power. The wire is for power lines supplied from Niagara Falls and will cost about $400,000. It will be one half inch in diameter and will be about [illegible] the weight of copper. The lines will [illegible] Toronto, Windsor, St. Catharines [illegible], Port Dalhousie and many other [illegible] with power to be used either for [illegible] purposes, electric lighting or for [illegible] purposes. It is the plan to supply power by this method throughout the entire province of Ontario. The aluminum wire will be made and drawn at the Niagara Falls and Massena, Que., plants of the Aluminum Co.

Canadian Machine Tool and Metal Markets

WINNIPEG.

Indications are that Winnipeg is to make vast industrial strides within the next two years at least. Every plant and machine shop in the city is working at its full capacity this winter and the business in all directions seems to be particularly bright for this season of the year. Although there is only a small demand for new machinery just now, the fact that trade from the manufacturers' standpoint is good, the machine tool trade has an excellent future. Steel working tools as yet have a weak market in this centre and only specialties are in demand. This is more particularly true of the smaller types.

The woodworking tool market has been and continues to be better. The saw-milling industries of the west are becoming more and more important and last fall many mills were equipped, and orders are in for some large planing machines and lathes. Construction machinery which always forms a large part of the trade in Western Canada is, of course, not called for now, but next season the demand for all types of hoisting engines, cranes and building machines will be very heavy.

The Stuart Machinery Co., are preparing to take care of a large amount of the machinery trade during the coming years. They will be in their new premises within the next few weeks.

The Board of Control again took up the question of appointing an inspector for machinery for the city power plant, and decided to appoint the inspector selected by the power engineers provided the cost would not exceed 1½ per cent. of the total cost of the machinery.

TORONTO.

Business continues to improve and some of the machine tool manufacturers will not guarantee deliveries for five months. Among the best selling lines during the past few weeks are heavy railroad machinery, radial drills and shapers. The prices of machine tools remain steady, prices being kept up by the increasing demand.

All the United States machinery centres report the same state of trade. They report a good volume of inquiries and a large percentage of these are turned into orders and the machinery dealers are anticipating a good season.

In power lines Canadian manufacturers are also busy. One manufacturer stated to Canadian Machinery that business during three weeks of January 1910 equalled the business of Jan. and Feb. 1909.

In the boiler trade, business is excellent and all manufactdrers of power lines are very busy. In electrical lines the demand for power equipment is keeping the plants at Hamilton, Toronto and Peterboro very busy. Orders in this line are increasing, a number of them being placed in United States, England and Sweden.

MONTREAL.

An improvement is noted in trade although it has not yet amounted to anything very significant. The mid-winter dullness is hard to shake off, and users who buy at all ahead have not yet started to figure out very seriously what they may require for future needs. The tone of the markets is very good. It was expected that tin and lead would be advanced, but the primary markets fell away, and thus local prices remain unaltered. All the way round, however, prices are firm.

The pig iron and steel situation look very promising. It is true that new business continues quiet, but the trade are glad of this as it enables the plants to catch up with back orders. Delivery is better, and the industry is getting into good shape for the great business that is anticipated later on. The situation in the United States and the Old Country continues unchanged. There has been a stimulation in iron buying in the States, with the finished steel trade quiet. The elections in the Old Country have disturbed the market there, but trade had kept up well, and when the turmoil is over plenty of business should break in.

Prices show a decided stability and a good demand exists. Quotations are as follows: Summerlee ranges from $23 to $24; Middlesboro No. 3 and Cleveland, $22; Glengarnock, $23.50; Jarrow and No. 1 Clarence, $21.75; and Canadian foundry iron, $22.

Speaking of the outlook H. J. Fuller, president of Canadian Fairbanks Co., Montreal, says:

"We know, that many plants are projected to be built during 1910. We ourselves, are, at the present time, building a large addition to our factory at Toronto, and a new factory in Montreal for the manufacture of a line not heretofore made in Canada by us. We believe that during the year 1910 we shall see higher prices and a demand which will be difficult to meet, even with all factories working to their utmost capacity. From one end of the country to the other, nothing but the utmost optimism seems to prevail, and unless the spring should be unusually late and cold, and promise doubtful crops, we see no reason why 1910 should not be the greatest and best year that Canada has ever seen."

W. S. Leslie, president of A. C Leslie & Co., Montreal, says:—"We look upon the prospects for the iron, steel and metal business as very favorable on the whole. Already nearly all the large buyers have shown their confidence by purchasing good quantities for delivery as far into the new year as producers would contract for; prices generally are stiffening and the advance seems to be fully justified by improvement in general trade conditions, and there is very little, if any, appearance of an attempt unnaturally to boom prices. We look for a further improvement as soon as the election in Great Britain is over."

Wm. McMaster, vice-president and general manager of the Montreal Rolling Mills, says:—"I look forward to a larger business in iron and steel products this year in comparison with 1909. The improvement in business in the United States, with the advances in prices, and the better feeling as to values in Great Britain and the Continent, all influence the opinion that 1910 will be a prosperous one for Canada.

CATALOGUES.

FLOATING REAMER HOLDER.—The Colborne Machine Tool Co., Franklin, Pa., have issued bulletin No. 40 which describes floating reamer holders made in two sizes for vertical boring mills with turret heads. They hold any make or style of reamer with Morse taper shank. A full description with prices is included in the bulletin.

AMERICAN STATESMEN.—The Carborundum Co., Niagara Falls, N.Y., have issued Vol. VII., of American Statesmen series which contains the life history of Benjamin Franklin.

ELECTRIC WELDING.—The Toledo Electric Welding Co., 141 Tenth St., Toledo, in a neat booklet describes the process of electric welding and the various machines. Prices are given showing the cost of electric welding.

CONVEYORS.—Booklets 34 and 34 have been recently issued by the Jeffrey Mfg. Co., Columbus, Ohio. The former deals with wire cable conveyors for various purposes. The latter contains descriptions of many styles of elevator buckets.

POLISHING LATHES.—A pamphlet from Charles Taylor, machine tool maker, Bartholomew St., Birmingham, Eng., describes, giving prices, patent ball bearing polishing lathes.

CRANES.—A catalogue dealing with railroad, shop and yard cranes has recently been issued by the Whiting Foundry Equipment Co., of Harvey, Ill., a copy of which may be had on direct application. This publication gives a general outline of the purpose for which cranes are used in railroad yards and shops. The illustrations are reproduced from photographs of actual installations, and cover the entire railroad field. From the handling of complete locomotives and parts thereof to the transfer of freight, very heavy loads are encountered and this company have originated many special designs, including gantry cranes for wheeling locomotives, traveling cranes running on circular track in roundhouses and service cranes.

SAND BLAST APPARATUS.—A pamphlet from C. Drucklieb, 178 Washington .St., New York, gives directions for connecting and operating the injector sand blast.

CUTTING METALS.—Cutting and welding metals by means of oxygen and hydrogen is the subject of an illustrated booklet issued by the American Oxhydric Co., Milwaukee, Wis. The process is fully explained.

INDUCTION MOTORS.—Bulletin 301 from Allis-Chalmers-Bullock, Montreal, deals with polyphase Induction Motors. These are described in detail, instalations are shown and in addition controllers, vertical motors are described. The advantages of the induction motor are given in the bulletin.

CUPOLAS.—Foundry Melting Equipment is the subject of a catalogue from George Green & Co., Keighley, Eng., describing cupolas, oil or gas furnaces, blowers, etc. One of the most interesting features is the "Emergency" cupola, instalations of which, have been made in almost every country on the globe, including the British Colonies.

CONTROLLING APPARATUS.—Adams Mfg. Co., 106 New Bond St., London, have issued a series of leaflets, now compiled in book form describing "Igranic" electric motor and dynamo controlling apparatus for direct and alternating current. All apparatus is fully described and illustrated, the volume containing a great deal of information making it a most useful one.

STEAM HAMMERS.—Catalogue 911 from the Buffalo Foundry & Machine Co., East Ferry St., Buffalo, describes fully with illustrations the various types of Bell Steam Hammers.

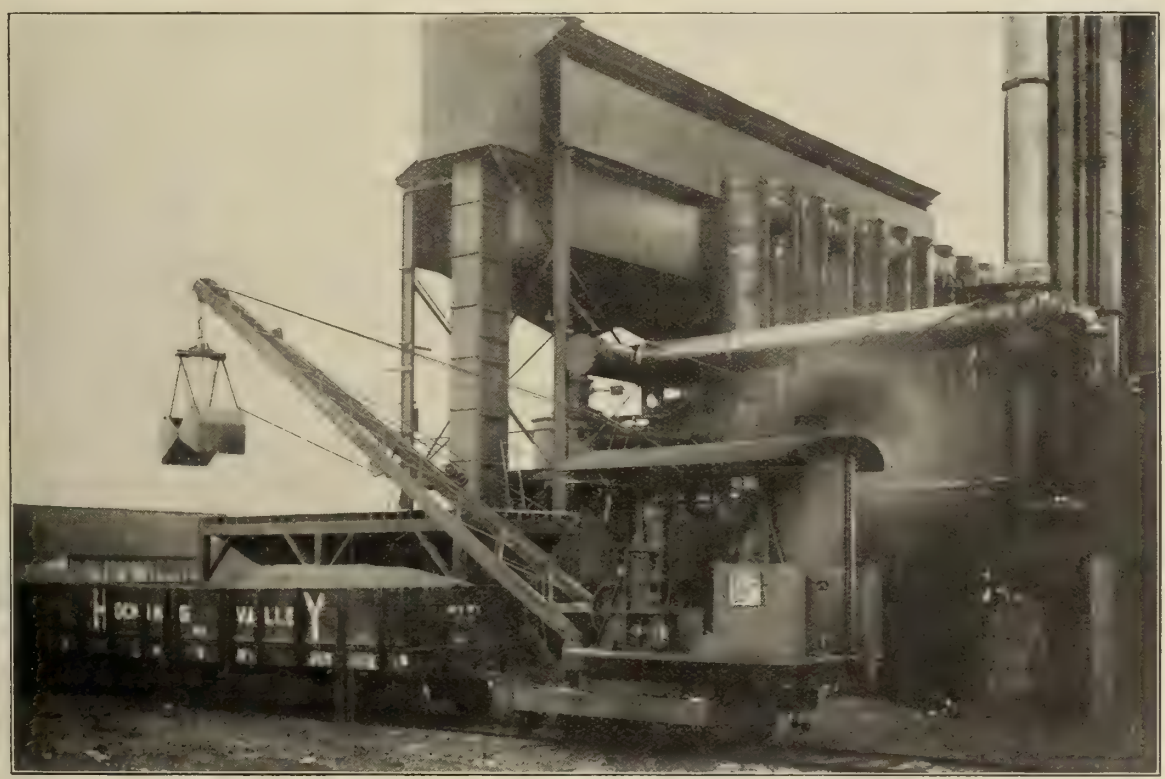
MOLDING SAND MACHINES.—Catalogue 5 from the Standard Sand and Machine Co., Cleveland, describes their mixers of various types, pulverizers, conveyors, etc.

JET CONDENSER.—A jet condenser giving a vacuum of 28.75 inches of mercury which is so designed that a thorough mixture of exhaust steam and cooling water takes place and at the same time the air present is prevented from pocketing and is delivered to the air pump at a minimum temperature, involves numerous interesting departures in condenser design. These features are brought out, and the general theory of jet condenser construction discussed in a reprint of the article, "A Radical Improvement in Jet Condensers." This booklet is being distributed by the Wheeler Condenser & Engineering Co., of Carteret, N. J.

UNIFORM TORQUE.—A pamphlet entitled, "Arrangement of Engine Cylinders to Produce Uniform Torque" has just been issued by the American Engine Co., of Bound Brook, N. J. This pamphlet contains typical indicator cards taken from the American Ball Angle Compound Engine, and also a derived crank effort diagram. This diagram shows that this type of engine produces a torque which is nearly as uniform as that given by steam turbines, while the steam consumption is considerably less than that of turbines. The booklet also contains a discussion of the crank effort diagram and will be sent free upon application.

BROWNING LOCOMOTIVE CRANES AND AUTOMATIC BUCKETS

Can be used with profit wherever material is handled



The photograph shows one of the many uses for which our cranes are available. With equipment of this kind, coal, crushed stone or any loose material, can be handled, at the lowest possible labor cost. We also equip these machines with a Lifting Magnet, current for it being generated on the crane by a separate engine. This device has reduced the handling of steel and iron to one-fourth of what it formerly cost by the old method. Considerable data bearing upon material handling problems of different kinds has accumulated in our hands and we invite those interested to consult us. Our Bulletin 35-Y contains many useful hints and is sent free. Write to-day.

The Browning Engineering Company

CLEVELAND :: OHIO

New York Philadelphia Pittsburg Chicago Birmingham Kansas City San Francisco

CALENDAR.—The Detroit Supply Co., dealers in facing, firebrick, foundry supplies and equipment, Windsor, have issued a 1910 calendar, printed in large letters, making it very useful for office use.

CALENDAR.—F. H. Hopkins & Co., Montreal, dealers in railway, contractors' and mining supplies remembered their friends with their usual calendar. It is printed in large type, making it a useful article.

NOTEBOOK.—The Garvin Machine Co., Spring and Varick Sts., New York, have issued their annual notebook containing calendars of 1910-11. It contains a great number of blank pages and very few advertising pages, making a very handy vest pocket notebook.

MACHINERY.—The Garvin Machine Co., Spring and Varick Sts., New York City, have issued an illustrated catalogue of 92 pages, edition G., January 1910. Besides descriptive matter of lathes, grinders, milling machine tools, pulleys, etc., it contains much valuable information in regard to milling, gearing, belting, etc., giving tables of speeds, weights and strengths of materials.

VERTICAL SURFACE GRINDER.—Pratt & Whitney Co., Hartford, Conn., pamphlet, referring to a new type of surface grinder recently brought out by this company. This machine is claimed to grind from 12 to 20 times faster than any other surface grinder, due in part to the cup shape of the grinding wheel, which covers the entire width of the work and insures flatness, together with rapid reduction. The illustrations show the method of fitting pieces to be ground in the machine and also different kinds of work that has been done on this grinder.

PUMPS.—Catalogue No. 6, issued by the Smart-Turner Machine Co., Hamilton, contains illustrated descriptions of the various types of Smart-Turner steam and power pumps including piston, plunger pumps with pot valves, automatic feed pumps and receivers, compound duplex pumps, triplex power pumps, centrifugal pumps, etc. The accompanying tables give full information in regard to the various sizes of each type.

SMALL D. C. MOTORS—Small direct current motors have proved their value in every modern industry and are used for a tremendous variety of applications, from running lathes to operating organ blowers. The application of these motors to laundry apparatus, printing presses and other machinery with similar requirements, has brought about changes and improvements in the rerpective industries which are having an important effect on their development. For this reason a bulletin just issued by the Crocker-Wheeler Company, of Ampere, N. J., describing apparatus of this type, has a vital interest for every up-to-date manufacturer. This pamphlet is well illustrated with half-tone engravings, showing applications of Crocker-Wheeler motors to various types of machinery. It also contains a lot of very interesting and valuable engineering information. A copy will be gladly sent on request. In writing ask for Bulletin No. 118.

BOOK REVIEWS.

ELEMENTS OF MACHINE DESIGN.—By Dexter S. Kimball, A.B., professor of machine design at Cornell University, and John H. Barr, M.S., M.M.E., manager Smith Premier Works. Published by John Wiley & Sons, New York, 444 pages, 5½ x 8½ ins., illustrated. Price $3.00 net.

The book is the outgrowth of the authors' experience in teaching machine design to the students of engineering at Cornell University. It is not a hand-book, nor is it a manual for the drafting room but a discussion of the fundamental principles of design gathered together and explained in such away and by the aid of illustrative numerical examples as to be of use as suggesting proper treatment of practical problems occuring daily in the manufacturing world.

The book is prepared with the end in view of developing rational analytical treatment with due regard to practical limitations, and of reducing the analysis to such forms that definite numerical results can be obtained in concrete problems.

ELECTRICAL POCKET BOOK—Published by Emmett & Co., 65 King St., Manchester, Eng., 270 pages, 4 x 6 ins., illustrated. Price 16 cents, postpaid.

The 1910 issue of the Mechanical World Electrical Pocket Book has been revised, large additions having been made on electric lamps and lighting. The following new sections have been introduced: motor converters, cables, wiring, meters, switches, etc. The book has been printed on thin tough paper reducing the bulk and incidentally reducing postage..

FUEL TESTS WITH ILLINOIS COAL.—Issued as Circular No. 3 of the Engineering Experiment Station of the University of Illinois, presents the results of an elaborate series of tests conducted at the fuel testing plant of the United States Geological Survey. The circular is compiled by L. P. Breckenridge and Paul Diserens. It deals only with coals taken from mines within the State of Illinois. The investigations described include steaming tests under boilers, gas producer tests, washing tests, coking tests, briquetting tests, and tests to determine composition and heating value. From the results stated it appears (1) that the average calorific value of Illinois coal (ash and moisture free) is 14319 B.t.u.; (2) that its evaporating efficiency is but slightly affected by the moisture it contains; (3) that its evaporative efficiency decreases as the ash and sulphur content increases, and that when burned in a hand-fired furnace its evaporative efficiency decreases as the amount of fine coal contained in it increases (4) the performance of Illinois coal in a gas producer compares favorably with that of any other bituminous coal tested at the U.S.G.S. laboratory; (5) one-fourth of all the samples tested may be used for the manufacture of coke; (6) briquetting improves the evaporative efficiency of Illinois coals only when the raw coal is in the form of slack or screenings.

Copies of Circular No. 3 may be obtained gratis upon application to W. F. M. Goss, Director of the Engineering Experiment Station University of Illinois, Urbana, Illinois.

Trade Notes.

Crosier, Stephens & Co., Newcastle-on-Tyne, remembered their customers at New Years with an aluminum envelope opener. Crosier, Stephens & Co., are specialists in aluminum manufacture.

The Skaleoff Co., Montreal, have been appointed Canadian agents for Beldam's Pilot Packing. This packing is one that is especially adapted to the use of superheated steam, being a combination of white metal and asbestos. It is made with a special cloth when for use with ammonia or on pumps.

BECKER STEEL AGENCY.

A neat catalogue on bond paper showing colored labels has been issued by the Becker Steel Co., Philadelphia. This catalogue was sent out by William Abbot, 334 St. James St., Montreal, who has been appointed sole agent for Becker steels in Canada. The line includes high grade tool steels, nickel and tungsten alloy steels and tool steel tubing. Prices are given f.o.b. Montreal, and tables of weights, rules for forging, hardening, grinding, annealing, etc., making a very useful catalogue.

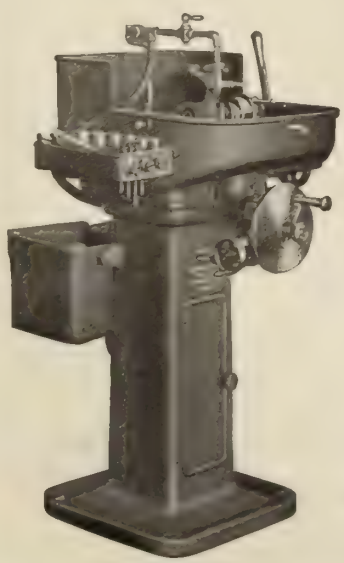
SELLING AGENT

Alexander Gibb, - - 13 St. John St., Montreal

Gear Cutters, to give the best results, must be ground radial and equidistant —a feature that is assured by the use of

No. 23 Gear Cutter Grinding Machines



When a gear cutter is sharpened and ground it is too often left with a tooth "hooking," or with another "dragging." In either case the work which it performs will not be up to the standard, and the gears will have imperfect teeth.

This machine performs the work accurately because of the indexing of the mechanism, which not only insures uniformity but also facilitates operation.

HARBISON-WALKER

The Standard *of* Quality

FIRE BRICK FOR CUPOLA LININGS

Do you figure *prices* per thousand brick or fire brick *costs* per ton of iron melted?

If the latter, we can help you. Our foundry records show it. Let us take it up with you. Quality tells.

BOILER SETTINGS

The grade that practically insures your settings when running overload, whether hand fired or mechanically stoked.

Your request will bring Catalog and full information.

HARBISON-WALKER REFRACTORIES CO.

Pittsburgh - - - Penna.

USE

BASSITE

As a substitute for Tin in your brass castings.

WHY?—

A pound of Bassite will solidify a greater proportion of copper than one pound of tin.

It makes castings cheaper, cleaner and tighter than is possible with tin. Will not burn in the sand.

Bassite is not a theory—not an experiment.
It is a practical success—Tried and Proven.
Does this difference in cost interest you?

Tin at 32½c. per lb. Quantity one ton, Total....$650.00
Bassite at 20c. per lb. Quantity one ton, Total....400.00
Actual saving in cost per ton being.....$250.00

Send us your trial order. No pay if unsatisfactory. Bassite will do just what we claim for it and we will stand back of our proposition to you. Try us.

The Bassite Smelting & Mfg. Co.

is, as its name signifies, a company with works situated at Levis, Quebec, manufacturing every machine required in the Shoe Making Trade, and also carrying on a large business as general engineers and machinists. The present works, originally occupied by Carrier, Laine & Company, were taken over last spring and since then several large contracts, including the engine and boilers of the Quebec & Levis Co., have been carried out most successfully.

The different Machine Shops, Foundry and Boiler Shops, are spacious and fitted with the most up-to-date plant for the rapid handling of the largest pieces. Mr. Ernest Caron of Quebec is the energetic and capable manager, and already a flourishing market has been opened in Great Britain and Europe for the firm's Shoe Machinery, where it is handled by leading firms in the trade.

Machinery Wanted and For Sale

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c. word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

MACHINERY FOR SALE.

FOR SALE—New and second hand Curtis Multiple Spindle Automatic Screw Machines, covered by United States patent Nov. 4, 1902; Canadian patent Jan. 20, 1903; English patent Feb. 26, 1903, and Belgium patent No. 167791. The John Morrow Screw. Limited, Ingersoll, Ont. (12)

MARINE GASOLINE MOTORS of unexcelled quality; jump spark type; two to eighteen horse-power; pleased to show our motors; send for new catalogue. Midland Engine Works Company, Midland, Ont. (1-11)

ONE 34" Oesterlein Plain Milling Machine, new. Kellogg & Co., 196 King St. West, Toronto.

3½ H. P. Gas Engine, complete with accessories, in first-class order. Kellogg & Co., 196 King St. West, Toronto.

FOR SALE—1 Gurney Scale Co. Foundryman's Testing Machine, with deflection indicator. Good as new. Standard Ideal Co., Port Hope.

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

PATENTS.

THE PROPRIETOR of the Canadian Patent No. 83902 "Improvements in camdises for operating the exhaust valve in four-stroke combustion engines," is desirous of entering into arrangements, by way of license or otherwise, for practically working the patent. For particulars apply to "Reversator," care of S. Gumaelii, Annoncebureau, Stockholm, Sweden. (10)

FIRE PROOF SAFES, VAULTS, ETC.

YOU need the best possible protection from fire! If your valuables are in one of our safes you can rest at ease; no fire is too hot for our safes and vaults to withstand. We manufacture vaults and safes to meet every possible requirement. Write for catalogue "S." The Goldie & McCulloch Co., Ltd., Galt, Ont. (tf)

MISCELLANEOUS.

ANY MAN who has ever lost money in the mails has had occasion to learn by painful experience that the only proper way to remit money is by Dominion Express Money Orders and Foreign Drafts. If lost or delayed in the mails, a prompt refund is arranged, or new Order issued without further charges. (tf)

DOUBLE YOUR FLOOR SPACE. An Otis-Fensom hand-power elevator will double your floor space, enable you to use that upper floor either as stock room or as extra selling space, at the same time increasing space on your ground floor. Costs only $70. Write for catalogue "B." The Otis-Fensom Elevator Co., Traders Bank Building, Toronto. (tf)

ELLIOTT-FISHER STANDARD WRITING-ADDING MACHINES make toil easier. Elliot-Fisher, Limited, Room 314, Stair Building, Toronto.

ELIMINATE fire risk, save insurance, reduce maintenance costs and save money on your actual building work by using the Kahn System of Fireproof Construction. Used in many of the largest business premises on this continent. Write for catalogue Trussed Concrete Steel Company of Canada, Limited, Walker Rd., Walkerville, Ont. (tf)

FIRE INSURANCE. INSURE IN THE HARTFORD. Agencies everywhere in Canada. (tf)

GET THE 1910 CANADIAN ALMANAC. Information on Customs Tariff, Bank Stocks, Foreign Exchange, Post Offices, Insurance, Assurance, Patents, Weights, Measures, Newspapers, Magazines, Succession Duties. Paper cover, 50 cents; cloth, 75 cents. At all dealers or postpaid on receipt of price. Copp, Clark Co., Ltd, Dept. C, 68 Front Street W., Toronto. (tf)

GET THE BUSINESS. Increase your sales. Use Multigraph Typewritten letters. The Multigraph does absolutely every form of printing. Saves you 25 p.c. to 75 p.c. of your printing bill. Multigraph your office forms, letterheads, circular letters. Write us. American Multigraph Sales Co., Ltd., 129 Bay St., Toronto.

HARRISON FISHER CALENDARS for 1910 make excellent Christmas or New Year gifts. Five pages in full colors. Size 14 x 22 inches. Pictures may be removed and framed at the end of the year as they are only "tipped" on the mounts. Price $3 boxed. Copp, Clark Co., Ltd., Toronto, are Sole Agents for Canada. (tf)

MR BUSINESS MAN, are you progressive? It's up to you to test "Consolidated," our new process carbon paper. Because it costs less. Soft finish, without smutting, and clear, permanent copies. Write for sample sheets and prices. "Consolidated," Stratford, Ont.

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley Street, Toronto. (tf)

SAVE 70% OF YOUR LIGHT BILL by using the "Just" Tungsten Lamp. Fits any socket. Burns any angle. All candlepowers from sixteen up. Prices as low as 50 cents. Better write us to-day. Sterling Electric Supply Co., Ltd., 369 Yonge St., Toronto, Ont. (tf)

"SYSTEMS" stand for all that is best in loose-leaf binders and supplies, letter-heads, statements and in fact your office stationery of every description. Send us samples of what you are using—we will send you prices that will interest you. Business Systems, Limited, Manufacturing Stationers, Toronto. (tf)

USE THE BEST CARBON PAPER. Our "Klear-Kopy" carbon gives clear, unsmudged copies of your letters and other documents. It has been selected by a leading government against 43 competitors. "Peerless" typewriter ribbons give clear letters and will not clog the type. Sold by all dealers. Write us for samples. Peerless Carbon and Ribbon Co., Toronto. (tf)

GET THE BUSINESS—INCREASE YOUR SALES—Use Multigraph typewritten letters. Typewritten letters, three thousand per hour on the Multigraph. The Multigraph does absolutely every form of printing. Saves you 25 p.c. to 75 p.c. of your printing bill. Multigraph your office forms, letterheads, circular letters. Write us. American Multigraph Sales Co., Ltd., 129 Bay St., Toronto. (tf)

INSURE health by installing Pullman System of natural ventilation. Simple, inexpensive. All foul air in room expelled through special outlets. Use in store, office and home. Send for free booklet. Wm. Stewart & Co., Saturday Night Bldg, Toronto; Board of Trade Bldg., Montreal.

MODERN FIREPROOF CONSTRUCTION—Our system of reinforced concrete work, as successfully used in many of Canada's largest buildings, gives better results at lower cost. "A strong statement," you will say. Write us and let us prove our claims. That's fair. Leach Concrete Co., Ltd., 100 King St. West, Toronto. (tf)

WHEN buying bookcases insist on having the best in the market—"Macey Sectional Bookcases." Carried in stock by all up-to-date furniture dealers. Illustrated booklet sent free on request. Canada Furniture Manufacturers, Ltd. General offices, Woodstock, Ont. (tf)

WANTED—A splendid opportunity for dealers to handle the best combination Duplicating, Addressing and Office Printing Machine on the market. Exclusive territory. Send name and address, giving occupation and references, to the Canadian Writerpress Company, Ltd., 33 John St., Hamilton, Ont. (tf)

YOU CAN DISPLAY YOUR GOODS TO BETTER ADVANTAGE through the use of up-to-date fixtures. We are specialists in the planning of stores and offices. Our catalogue contains illustrations of many new features and several handsomely equipped stores and offices. Shall we send you our catalogue J? Jones Bros. & Co., Ltd, 30-32 Adelaide St. West, Toronto. (tf)

MANAGER WANTED.

WANTED—Practical manager experienced in the manufacture of small interchangeable parts. Must have experience. P.O. Box 325, Montreal. (12)

WANTED—In every machine trade centre, a live man, with trade acquaintance, to sell a high class and money-saving tool, already widely used and advertised. Give age, experience and references. Box 94, CANADIAN MACHINERY, 10 Front St. E., Toronto.

Men in Charge

—Owners —Superintendents
—Managers —Foremen
—Purchasing Agents

¶ Ah! These are the men you want to reach with your advertising.

¶ There is a reason why CANADIAN MACHINERY AND MANUFACTURING NEWS is THE medium you should use in a large way to reach these men.

¶ Given a good journal,—well edited, illustrated and well printed, the paid-up circulation would be small were not a vigorous campaign carried on, both by mail and personal work.

¶ CANADIAN MACHINERY is well edited, well illustrated and well printed—the one source in Canada of timely, reliable, first-hand information to mechanical men.

¶ But we are not satisfied with simply publishing a good journal. Eight thoroughly-trained, salaried subscription men are out hustling for subscriptions—are getting the business, or we want to know the reason why. In addition, we are represented in practically every railroad shop and other large shops by special agents, who are well paid for every order sent in—and every mail brings orders from these men.

¶ No machine shop, foundry or metal-working shop of any class, whether large or small, is overlooked by our subscription plan.

¶ Above is one GOOD reason why you should not overlook this journal as your strongest aid to more business in 1910. There are many others.

Want to talk it over? Write us.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

10 Front St. East, Toronto

MISCELLANEOUS.

DOES YOUR FIRE INSURANCE POLICY protect you? There are points in connection with fire insurance policies that need expert handling to secure proper protection. We are fire insurance experts. We can safeguard your interests and procure the lowest rates. Mitchell & Ryerson, Confederation Life Building, Toronto. (tf)

ERRORS AVOIDED—LABOR SAVED—Using the Shouperior Autographic Register. Three copies issued at one writing. 1st, invoice; 2nd, delivery ticket; 3rd, charge sheet, perforated for filing. No handling of carbons. High grade printing and neat invoices. Make full inquiry. Autographic Register Co., 191-193-195 Dorchester St. East, Montreal.

FOR SALE.—The right to manufacture and sell on royalty in the Province of Ontario, and also in the Western Provinces, a fire escape which has been proven to be the best and only complete fire escape in the world. The right man can make a fortune out of this proposition. For all information address, The Universal Fire Escape Co., No. 234 Dufferin St., Montreal, P.Q.

FIREPROOF Windows and Doors made strictly to the Fire Underwriters' requirements reduce your Insurance Rates and protect your building. We are experts in this line, and guarantee you really fireproof goods, and the maximum insurance allowance. Let us give you our figure. A. B. Ormsby, Limited, Sheet Metal Workers. Factories, Toronto, Winnipeg.

PROBABLY the most talked about machine in Canada is the Hainer Book-keeping Machine. It combines in one machine the cash and credit register, time recorder and account register. Representatives wanted everywhere. Write for our proposition. Book keeping Machines, Ltd., 424 Spadina Ave., Toronto.

$75 buys the best duplicating machine on the market. ACME will print anything a job-printer can do. Complete outfit; Acme Duplicating Machine; one tubular stand fitted with type cases; compartments plainly lettered and arranged like universal keyboard of the standard make of typewriters; one drawer for accessories and forms; 20 lb. font of typewriter type; one chase; one Acme ribbon any color with typewriter ribbon to match; one pair tweezers; two quoins; one key; one oil can; and one set of reglets. Sold with a guarantee. Acme Duplicator Co., Baltimore, Md., U.S.A.

INSURE health by installing Pullman System of natural ventilation. Simple, inexpensive. Fresh air introduced under window sash, is gradually diffused throughout room. All foul air in room expelled through special outlets. Use in store, office and home. Send for free booklet. Wm. Stewart & Co., Saturday Night Bldg., Toronto; Board of Trade Bldg., Montreal

KEEP ACCOUNTS WITHOUT BOOK-KEEPING. A century ago accounting meant keeping books; to day you can keep accounts cheaper, better, quicker and more accurately by throwing away all books and installing a McCaskey Account Register. Don't be skeptical—investigation costs nothing. Write us today. Dominion Register Company, Ltd., 100 Spadina Ave., Toronto.

THE METAL REQUIRED in a Modern Concrete Building. Our special facilities enable us to produce at minimum cost Concrete Reinforcements, Fenestra Steel Sash, Automatic Fire Shutters and Steelcrete Metal Lath. Complete stock, quick delivery. Before deciding write us for catalogue and prices. Expanded Metal and Fireproofing Co., Ltd., Fraser Ave., Toronto. (tf)

BETTER RESULTS AT LOWER COST

can be secured for any class of castings by arranging your mixtures by analysis. Years of practical experience in foundry work are at your service when you consult with

The Art of Welding Metals

The use of the ***Oxy-acetylene blow-pipe*** in welding has greatly extended the field in this class of work.

Simple or complicated fractures and breaks in all kinds of machinery may be repaired and made almost equal to new in strength and appearance; the broken edges of iron, steel, aluminum and other metals are melted together with the addition of more metal under a temperature of 6,000 to 7,000 degrees Fahrenheit.

This plan is much superior to brazing or riveting and may be used for an infinite variety of new and repair work hitherto done by less efficient methods.

We have installed a plant for the purpose of welding by this process, and shall be glad to send particulars and quote prices.

Enquiries and correspondence solicited.

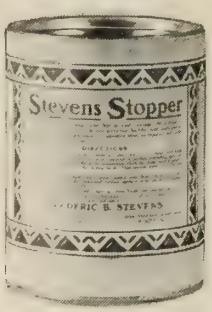
MANUFACTURERS OF

Crucibles of Quality



TO become successful, it is necessary to travel along the path already proven a successful path. If you discover one way of saving time, you have reduced the biggest footprint on your payroll. If you are making machinery castings, and you use **STEVENS' STOPPER** for "stopping" the pin holes in your defective—but otherwise good—castings, you save the castings, that's a saving worth while. It costs less than the higher priced cements and is equally effective. Its price is twenty-five cents per pound, in a can of any size you may prefer. Its use saves several times its cost the first time you use it.

I Manufacture FOUNDRY FACINGS and SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES, and all are effective, and so they are time-savers

Listen, Mr. Foundryman

¶ Within the next month or so our representatives will visit every foundry between Halifax and Windsor, Ont. They will have samples to show you, and we will guarantee that every pound of material we will ship you will be identical—now and always.

¶ We want to get acquainted with you, and, in the meantime, to make sure that our guarantee means something, ask your banker about us.

¶ To those outside of the territory above mentioned, we will be very glad to send samples and prices.

Plumbago—We are so close to the market on this that it doesn't pay us to dope it. What you get from us is absolutely pure.

Facings—You will find our stove-plate, heavy machinery or car-wheel facings a little better than what you have been using.

Sands—It makes no difference what you want—we have it—our handling facilities are so complete that we will give you a bigger dollar's worth than ever you had.

Coke—Ours is a guaranteed 72-hour foundry coke. We have yet to receive any complaints.

Glutrin—A large stock always on hand.

Perfection Parting—Many times imitated, but never equalled.

Equipment—Having our own shops, we manufacture most of the equipment that we sell, therefore it is more likely to be right.

Oil Furnaces—Being the only manufacturers of this type of equipment in Canada, it is quite logical to add that, if you need this equipment, and every up-to-date shop does, it will pay you to communicate with us, and that at once.

Power House at Decew Falls of Dominion Power and Transmission Co., Ltd., and Lincoln E. L. and P. Co., Ltd.
2½ miles from St. Catharines, 100,000 H.P.

WHY? BECAUSE—

1. TWENTY-EIGHT PLANTS have located here for good reasons—most of them Metal-working Industries.
2. ELECTRIC POWER is cheaper here—right where it is made—than elsewhere. Less than one-third the cost of steam.
3. WATER SUPPLY is from Lake Erie, with a head of about 200 feet.
4. FREIGHTS are as cheap here as if we had 100 railroads. BESIDES, you can use our port for water shipment to all great lake points and to salt water.
5. LABOR – Good supply of skilled mechanics and laborers. Cost workmen own their own homes. They come to stay.
6. SITES are available for YOU to choose from, all good ones, and to be got at figures and terms which are big inducements.
7. INCIDENTALLY—We are one hour (by electric and steam railways) from Niagara Falls and Hamilton.

ALSO—St. Catharines is the market and shipping point for Canada's Greatest Fruit District——

Pattern Making

By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions

Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

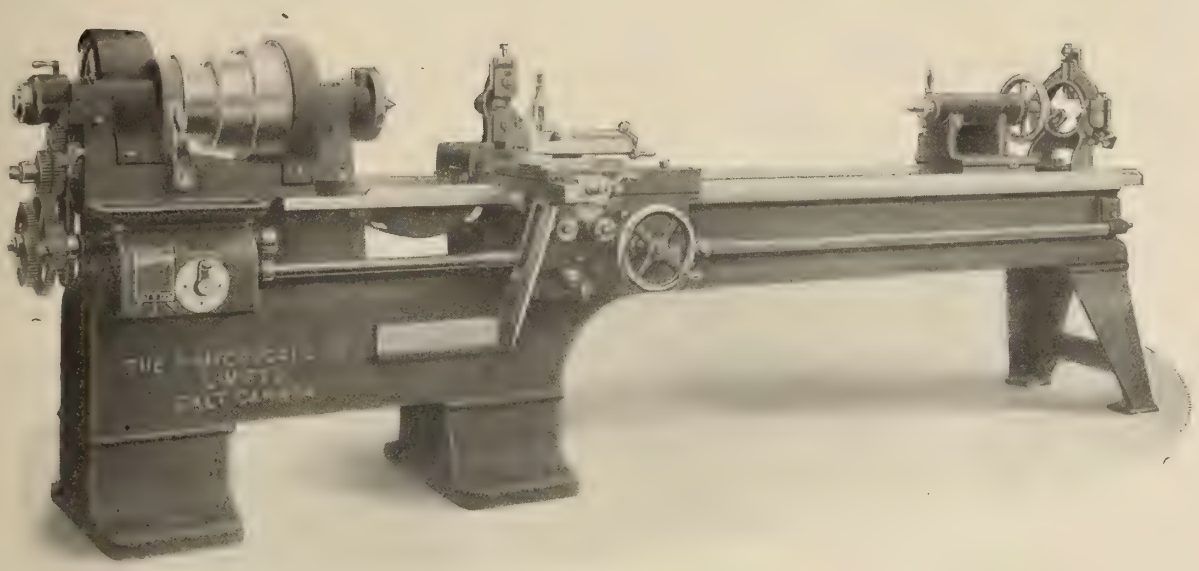
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

LABOUR SAVING MACHINE TOOLS

MANUFACTURED BY ALFRED HERBERT, LTD., COVENTRY ENG.

The Patent Hexagon Turret Lathe

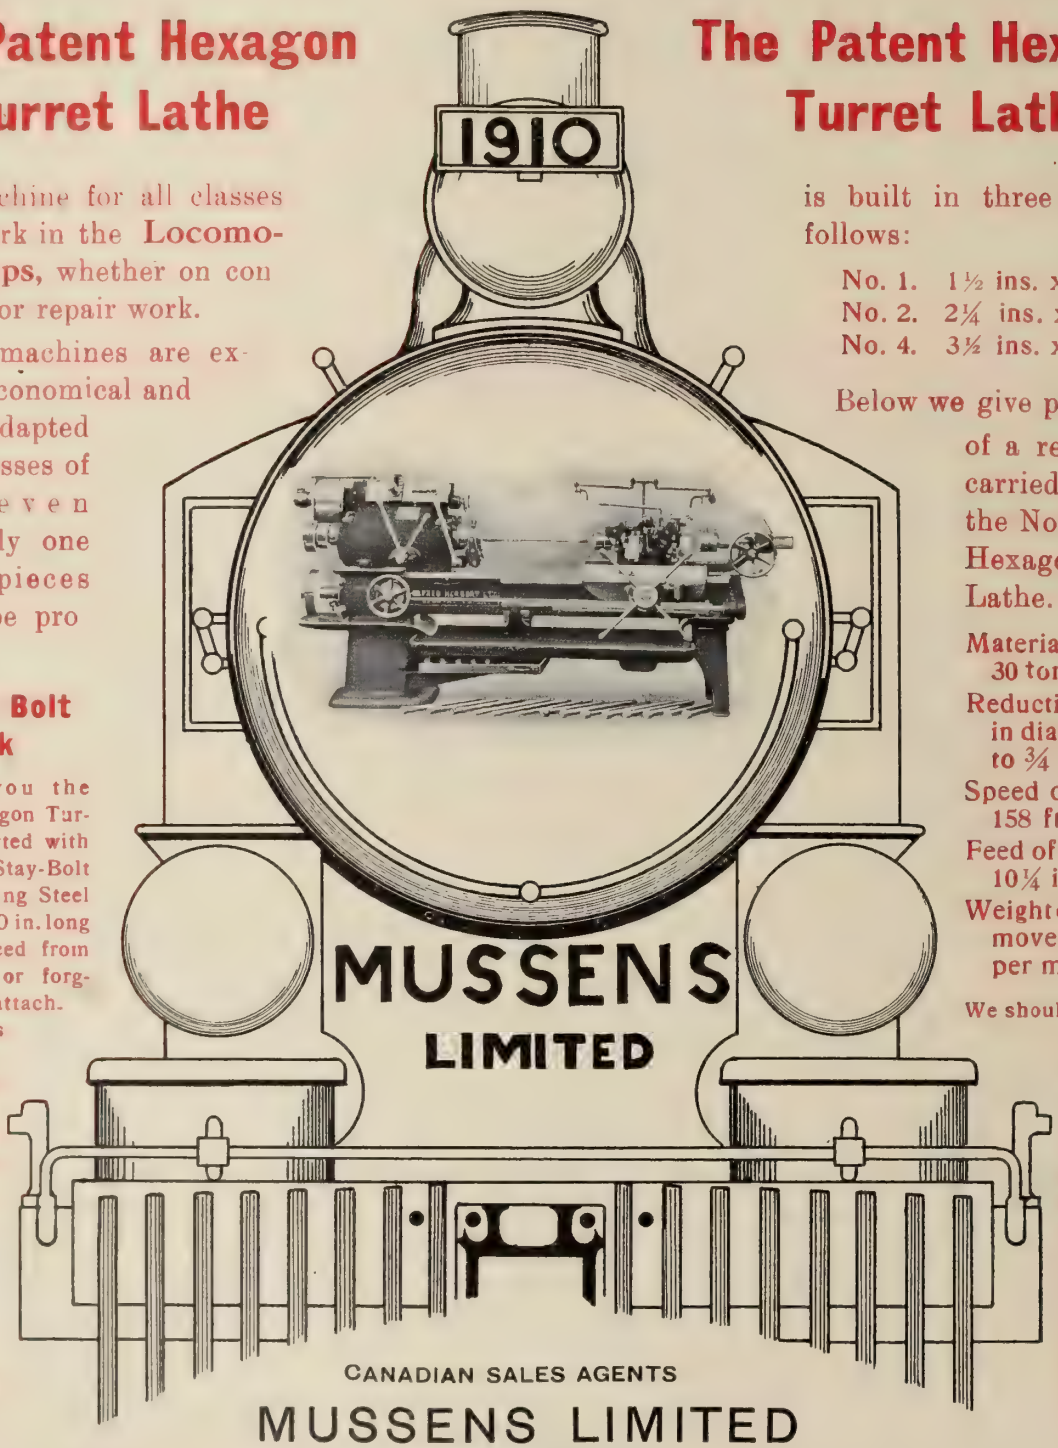
is the machine for all classes of bar work in the **Locomotive Shops,** whether on construction or repair work.

These machines are extremely economical and equally adapted for all classes of work, even where only one or two pieces have to be produced.

On Stay Bolt Work

we offer you the Patent Hexagon Turret Lathe, fitted with the Patent Stay-Bolt outfit, enabling Steel Stays up to 30 in. long to be produced from either bars or forgings. This attachment enables stay bolts to be produced completely in record time without any subsequent operations.

Send for details



The Patent Hexagon Turret Lathe

is built in three sizes, as follows:

No. 1. 1½ ins. x 21 ins.
No. 2. 2¼ ins. x 30 ins.
No. 4. 3½ ins. x 42 ins.

Below we give particulars of a recent test carried out on the No. 2 Patent Hexagon Turret Lathe.

Material, 30 ton mild steel
Reduction in diameter, 2 in. to ¾ in.
Speed of work, 158 ft. per min.
Feed of tool, 10¼ in. per min.
Weight of metal removed, 7¾ lbs. per min.

We should be pleased to give a guarantee of output on receipt of samples or sketches.

We also carry a complete line of Machine Tools and High Speed Steel. Particulars free on request.

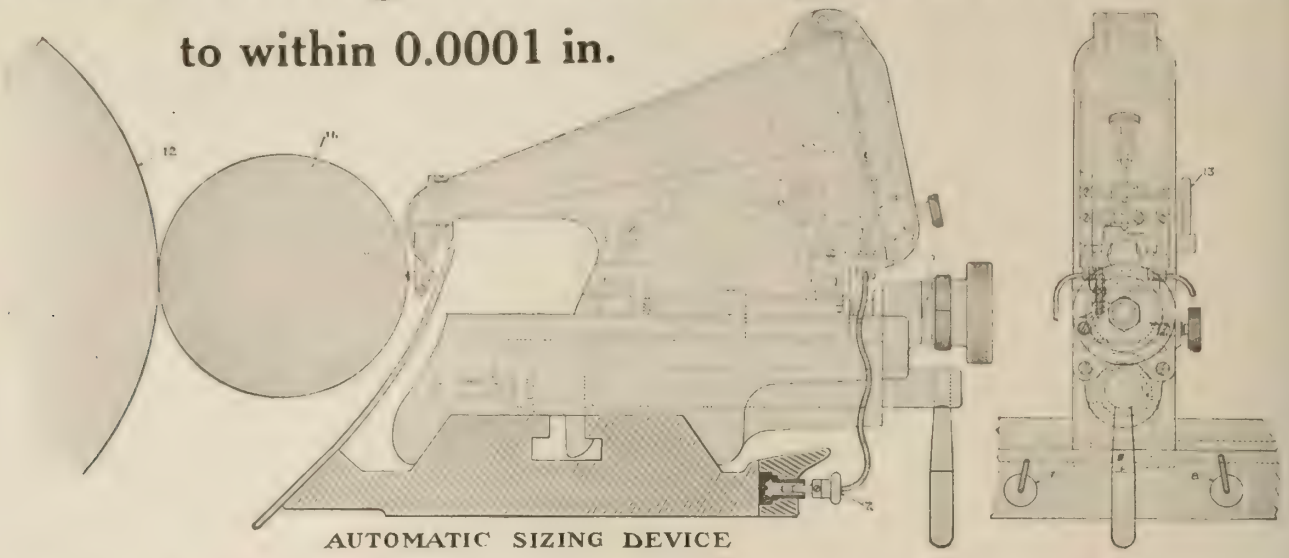
For Grinding and Sizing Automatically

to within 0.0001 in.



AUTOMATIC SIZING DEVICE

The P. & W. Automatic Sizing Grinder

Permits operator to be simultaneously engaged in other work or in operating several machines.

The P. & W. Sizing Device takes care of the entire grinding operation after work is once placed in position. It automatically changes the coarse roughing feed to a fine feed to remove the last thousandth and produce a mirror finish. Feed automatically stops after the exact size is obtained. Wear of grinding wheel has absolutely no effect whatever on the sizing device.

The Only Attachment of its Kind and a Standard Part of the Machine.

Write for illustrated Circulars.

For the Rapid Manufacture of Brass and Steel Specialties

The P. & W. Turret Lathes

A standard machine tool with the accuracy of a high grade engine lathe. Thoroughly and rigidly constructed. Has a positive, unyielding control with a simple and reliable action which permits of rapid manipulation.

Tool outfit rapidly and quickly adjusted to a wide range of work.

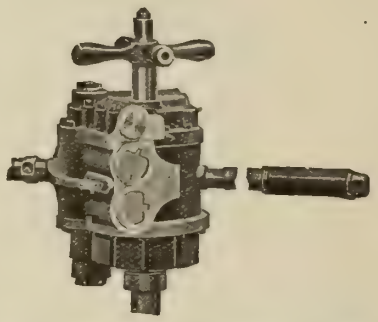
From the Drill Press of the Savage To Our Modern Tools of 1910

A.D. 910



A.D. 1910 "LITTLE GIANT DRILL
The Right Bower of Modern Machinists

It's a long cry back to the days of the savage's flint and cleft stick. His methods create no envy in these days of close competition and endeavors towards decreased costs. But flint and stick have undergone a wonderful development. The advent of the Air Compressor opened the way for a new line of power tools, and to the Chicago Pneumatic Tool Co. is due the honor of having been the pioneers in the manufacture of portable air and electrical tools, and they are still leading their competitors from the fact that their tools represent the very best machinery of their kind that money, brains and experience can produce; therefore the buyer of the Chicago Pneumatic Tool Co.'s product has the advantage of original experiments, and the services of the best air and electrical tool engineers in the world.

Monarch Acme Core Ovens

Produce Economical Results at Low Prices

There's no Stronger Argument than

Demonstrated Reliability!

On the basis of decreased cost of production, of increased production of metals, of retention of quality of metals, of avoidance of unreasonable loss by oxidation, and of small expense in repairs to linings and parts of furnace the

MONARCH

"STEELE-HARVEY" CRUCIBLE TILTING FURNACE

stands without a peer.

OIL or GAS and air form the fuel for this furnace—no coal or coak in any case—and not only is there no waste in the ash-pit, but the cost of operation shows

A Saving of Fifty per cent.

An intelligent man can operate three furnaces, and **continuous** melts are made all day. Retaining the crucible in furnace doubles its life over pit-furnace use

Other leading **Monarch** lines are "Acme" Core ovens, "All Metal" Cars for Ovens, Miscellaneous Furnaces, Blowers, Pumps, Burners Core Ovens, Ladle Heaters, Tanks, Case Harden, Tempering, Brazing and Annealing Furnaces. Write us your needs and troubles. Catalogue "M" 5.

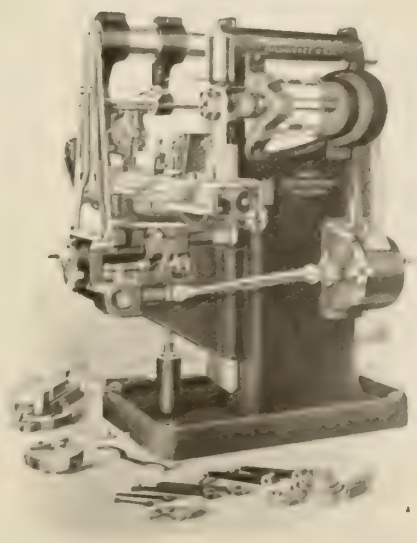
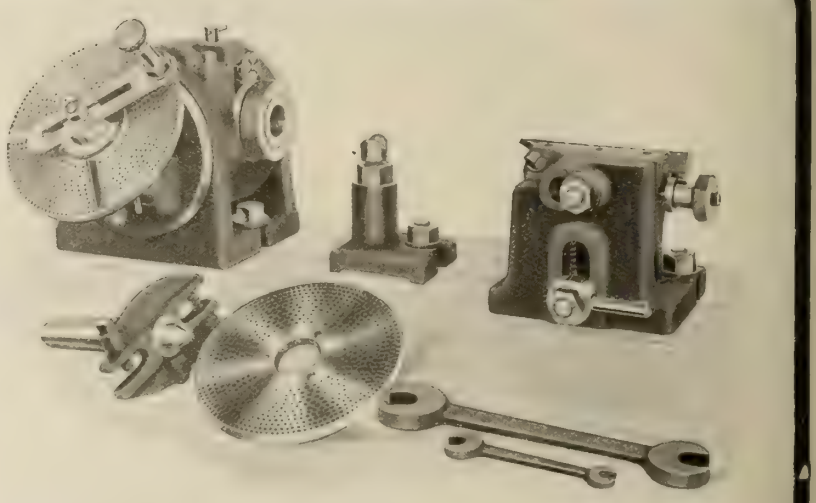
KEMPSMITH
MILLING MACHINES

Lead in capacity for rapid production of reliable work.





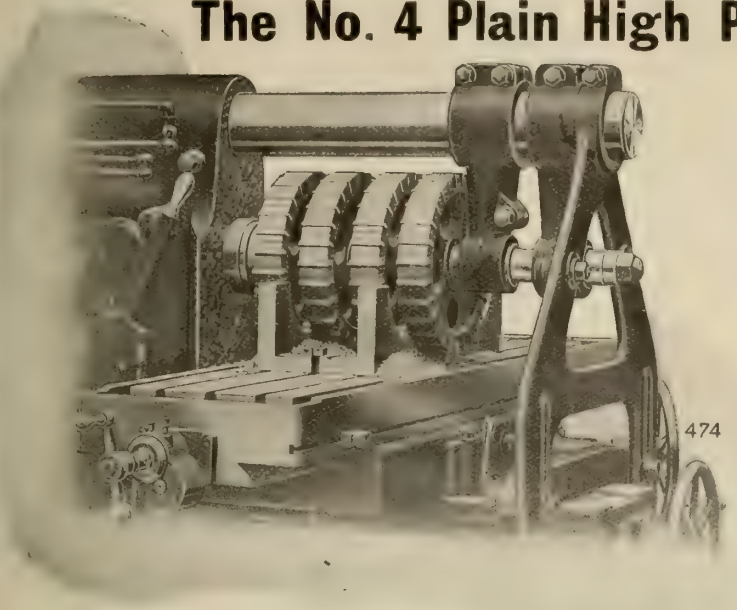
The New Universal Dividing Head furnished on these machines is a remarkable improvement over former constructions, and has distinct and positive advantages over any other Dividing Head made.

The new literature explains.

THE KEMPSMITH MFG. CO.
MILWAUKEE, WIS.

Canadian Agents: The London Machine Tool Co., Ltd., Hamilton, The Rudel-Yeates Machinery Co., Montreal.

The No. 4 Plain High Power Cincinnati Miller



direct connected to a 10 H. P. variable speed motor, milling grey iron castings.

The cutters are 13½" diameter, high speed steel, run 13½ rev., taking a cut ⅛" deep across eight surfaces, having a total width of 23" at a feed of 4" per minute. This amounts to 11½ cubic inches of iron removed per minute. and even this is not the limit of the capacity of the machine, but is all that the cutters will stand.

This is evidence of the tremendous capacity of this new line of millers. We make four sizes: No. 2, No. 3, No. 4 and No. 5.

Ask for our High Power Miller Catalogue.

THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

This Barrel Leaks Your Money

¶ Every wooden shop barrel you have is leaking away your money. You are paying more than you used to for wooden barrels — but even when you bought them cheapest you were really losing money that you might have saved with our STEEL SHOP BARRELS.

¶ Steel Shop Barrels you'd need, cost just about what you would pay for wooden barrels used during a year. But the second and third, and maybe other, years you would buy no barrels at all. That looks like 100% a year saving, doesn't it?

¶ Besides, our Steel Shop Barrels are easier to handle, take up less room, look better, and don't fall apart when you are not expecting it—or any other time.

¶ Even a small shop can save hundreds of dollars a year with our Steel Shop Barrels, Boxes, and other money-saving things for factories.

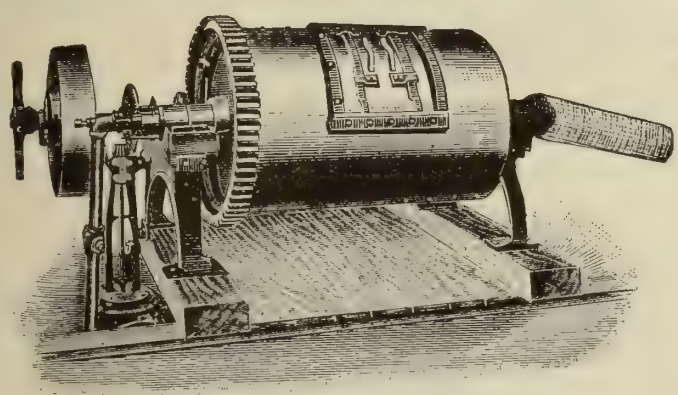
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

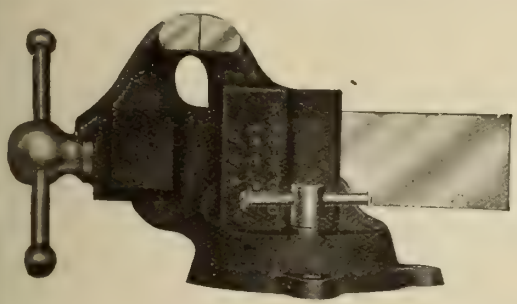
SOLID JAW PARALLEL VISE
Stationary Base Type

Hollands Vises and Tools

have been recognized as standard quality for twenty years, and are used exclusively in many of the leading Industrial and Railway Shops in Canada and the United States.

Hollands Manufacturing Co. - Erie, Pa.



STANDS USE OR ABUSE

In the first place, the design was developed by deliberate breaking tests so that we are able to get plenty of metal at the points where it is needed most. Then, too, we give an amount of care and detailed attention to the manufacture of these Vises which would make them cost a lot more money if we did not make them in such large quantities and under specialized methods. Every part is made to limit gauges, and as a general rule these limits provide for variations of not over .001".

REED MANUFACTURING COMPANY, - - ERIE, PA., U.S.A.

DON'T relegate those apparently unmachinable castings to the scrap heap.

NOVO SUPERIOR
HIGH-SPEED STEEL

has already saved hundreds of castings from this fate.

Will readily cut castings which could not be touched with the best standard high-speed steels.

One customer writes: "We have been using a NOVO SUPERIOR tool continually for the last four weeks on cast iron fly wheels running at a speed of from 15 to 25% higher than we had been able to run with ——— High-speed Steel. During this time we have used up but one inch of the tool. . . . . We have not yet hardened the tool the second time" etc.

Have you any NOVO SUPERIOR in your shop? If not, send us a trial order and convince yourself of its remarkable qualities.

WRITE FOR FURTHER PARTICULARS.

HERMANN BOKER & CO., 332 St. James St. MONTREAL

NEW HIGH-SPEED STEEL

Engineers now have the opportunity of using a much more durable Steel than the best High-Speed Steel hitherto used, and this they will find in our

Allen's IMPERIAL Special (The new improved) High-Speed Steel

which may be either air-hardened, oil-hardened or water-hardened.

This ***Imperial*** Special Steel will cut much harder materials than can be cut with Tools made of ordinary best High-Speed Steel, and heavier cuts may be taken, or Machines may be driven at accelerated speeds when (in either case) it is found economical to do so. ***Imperial*** Special will also wear much longer than ordinary best High-Speed Steel before requiring to be re-ground.

IF YOU WANT A BETTER QUALITY OF STEEL than that you now use, we shall be glad to receive your orders for our

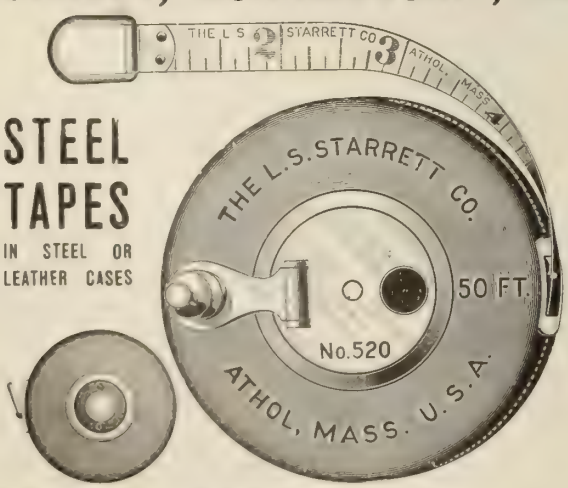
STARRETT TOOLS

ARE THE STANDARD

FOR ACCURACY, WORKMANSHIP, DESIGN AND FINISH



STEEL TAPES
IN STEEL OR LEATHER CASES

In our tapes the figures denoting feet are smaller than those denoting inches. Two reasons for this:

This dissimilarity of figures materially lessens (in fact ought to entirely prohibit) the liability to erroneous readings that frequently occur through the uniformity of all figures in steel tapes of other makers.

The smaller figures denoting feet allow the graduation line under each to be plainly visible, instead of being obliterated by the usually larger figure.

Graduated in feet, inches and eighths of an inch, or in feet, tenths and hundredths of a foot.

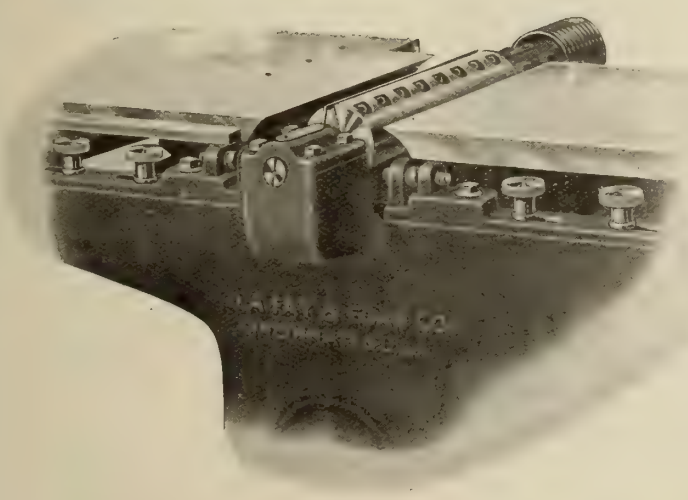
A New Circular Cutter Head



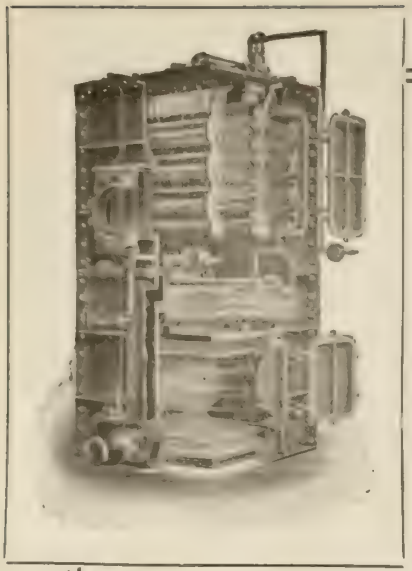
THIS ILLUSTRATION is a section taken from the **J. A. FAY & EGAN CO.'S** No. 61 C Hand Planer and Jointer, with the tables drawn back, giving the reader an idea of their New Safety Circular Cutter Head.

This new Cutter Head closely fills the opening between the tables, so that the most severe accident that could possibly happen would be the scraping of a finger or thumb.

The design is such that the cutting edges of the knives protrude but slightly from the circumference of the cylindrical-shaped head, and thus permit the tables to be set very close to the cutter.

You are requested to write the Manufacturers for their new Catalog No. 81, which illustrates and describes their New Safety Circular Cutter-Head in full

J. A. FAY & EGAN CO., 362-382 W. Front Street, CINCINNATI, OHIO.



More Work for Less Cost!

Any proposition that will diminish working costs *must* appeal to every shop owner.

Have you investigated the

Webster Feedwater Heater, Purifier and Filter?

It makes use of all condensations and waste steam, and will positively rid your boiler of scale by removing scale-forming elements from feedwater. Using pure water means getting every ounce of power out of your boiler, with a *smaller* amount of fuel. Our descriptive literature is full of points for you! Send for it to-day.

WELLAND CANAL.
SUPERINTENDING ENGINEER'S OFFICE

J. J. Weller. St. Catharines. 8 October, 1909

The Packard Electric Co. Ltd,
St Catharines,
Ont.

Dear Sirs;—

Re your enquiry about the S.H.P. motors which were purchased from you by the Department two years ago for operating the lock gate mechanism on the Welland Canal, I wish to say they have proven entirely satisfactory, and, notwithstanding the fact that the work required of these motors is extremely severe, I have had no occasion to incur any expense for repairs.

Yours truly,

Superintending Engineer.

FORTABLE ELECTRIC MOTOR

Have you ever had to drill a few holes in an awkward place, or to remove a few jags off a big casting, and spent a lot of time doing it by hand?

This cut shows a little thing, but a **BIG LABOR SAVER.**

The motor is fitted with a gear and two shafts, one running four times the speed of the other, so you have a big range of speed. It will drill a 1¼" hole, run a breast drill, or a hand grinder, expand a boiler tube; in fact, do anything that a motor will do. Note the big wheels, a boy can pull it over a railroad track with ease.

No matter what you make—if you use a tool—you've got a use for it and it will pay you to investigate.

Some Notes on the Cost of Operating Machine Tools

A Full Knowledge of Costs is Essential in Manufacturing—This Article Reprinted from the Electric Journal gives the Cost of Operating Machine Tools.

By A. G. POPCKE.

In addition to the wages of the machinist, there are other hourly operating expenses which must be charged against each tool in a machine shop. These will be referred to in this article as machine-hour rates. They include a proportional share of the general charges and also specific charges relating to each specific tool. The conditions are somewhat similar to those encountered in central stations. Before competition was very great, it was considered sufficient to figure the cost of generating power from the amount of coal and water consumed, and the wages of the power house attendants. Many industrial plants of considerable size that generate their own power still use this method. Most central station managers, however, have found it necessary, as the demand for power increased and the business became more complicated, to figure more closely and to analyze more thoroughly, all their expenses, among which are interest and depreciation on the cost of all buildings and equipment, salaries of officials, engineering staff, clerk, miscellaneous office expenses and advertising charges.

General Charges.

In a machine shop these charges may be considered under three general heads—fixed charges, variable charges and salaries. They can be determined for a given shop at intervals of a month or more and then divided among the several machines. The best method of making this division depends on so many local conditions that no general rules can be given. If all the tools are doing work of the same general class and are in use approximately the same proportion of the total time, a part of the total general charge can be set off against each tool in proportion to the floor space occupied by both the tool and the material on which it works. The general charge against each tool continues whether the tool is operating or idle, and the method of dividing the general charges must always take this fact into consideration.

Fixed charges include interest, insurance, and taxes on the investment in buildings and auxiliary equipment, such as heating and ventilating systems, fire appliances, benches, cranes, etc. If a shop is rented, the rental must include the foregoing charges and an additional sum for profit to the owner.

Variable charges include repairs on buildings and equipment to maintain the efficiency, losses due to breakage, defective material, defective design, workmanship, etc.

Salaries include cost of management, superintendence, engineering and designing, clerical work, care of plant, miscellaneous labor, etc.

Specific Charges.

In addition to the foregoing general charges, the cost of operating a tool is affected by the following specific charges which can be determined for each tool:

Interest on the cost of the tool and its auxiliaries.

Depreciation of the tool and its auxiliaries.

Cost of power consumed by the tool.

The interest on the cost of the tool is fairly taken at six per cent. A reasonable method of making allowance for depreciation, in most cases, is to allow ten per cent. of a reducing balance; that is, ten per cent. of the first cost is charged off the first year, then ten per cent. of the remaining cost the second year, and ten per cent. of that remainder the third year, etc. This method is based on the fact that the apparatus actually decreases in value year by year. Allowance for depreciation in any given year can be made by the aid of Fig. 1. This curve gives the per cent. of the first cost corresponding each year to ten per cent. on the reduced balance. For example, the curve shows that the depreciation on a tool that has been in service five years will be 6.6 per cent. of the original cost. If this cost was $3,800 the allowance for depreciation during the sixth year, according to the ten per cent. reducing balance method, is $3,800 multiplied by 0.066 equals $250.80. Since this amount is ten per cent. of the reduced cost the value of the tool at the end of the fifth year is $2,508.

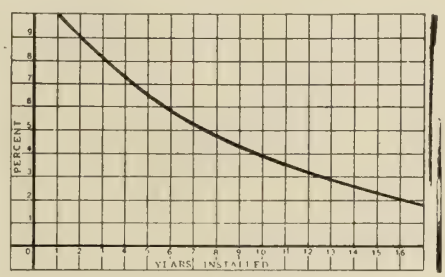

Fig. 1.—Depreciation at 10 per cent. Reducing Balance.

Costs of Power.

Tools for special work which will be discontinued after a comparatively limited period depreciate in value much more rapidly than is indicated by the foregoing method; a special allowance, generally known as utility depreciation, should be made for such tools.

The cost of power for each tool can be obtained by ascertaining the power demand in kilowatts per hour and multiplying this number of power units by the cost per unit and the number of working hours. If power is generated under the shop management, its cost must be determined from the station records; if purchased, the contract price must be used. If the machines are equipped with individual motors records for each class of work may easily be obtained by the use of graphic recording meters. These records will show what the standard conditions should be and what they actually are. Check records may be taken frequently to see that all machines are working at the desired efficiency.

Each machine may be considered as a manufacturing centre and the general charge against it as rental. Each centre receives its material from another, performs some work on it and passes it on with an added value to the next centre. This added value, less the general and specific charges, is the profit accruing to each centre. Since the general charge is continuous, it is evident that each centre must do more than enough work to meet this charge, otherwise it will show a loss; also it is evident that the more work there is done in each centre, the greater the profit.

By determining the costs outlined in Table I and classifying them as in Table II, improvements in operating conditions will suggest themselves and if put into effect, the operating costs can usually be reduced. The data in Table II was obtained by the aid of graphic recording meters in connection with motor-driven machine tools. The data in this table is typical of conditions in many large machine shops. The

figures given indicate the following division of total operating charges:

Variable charges from 50 to 55 per cent.
Salaries from 25 to 30 per cent.
Interest on cost of machine tools from 5 to 10 per cent.
Depreciation on cost of machine tools from 5 to 10 per cent.
Fixed charges 3 per cent.
Powder 1 per cent.

Table II shows no machine-hour rates less than 48 cents an hour. Usually the machine-hour rates are at least 50 per cent. greater than the operator's pay. It is perfectly evident from this that consideration of the operator's pay alone gives results far from correct, when the total cost of operation is under consideration.

In some cases it has been found that the introduction of individual motor drive has resulted in an increase of 20 per cent. on production as well as making it possible to obtain accurate data by means of graphic recording watt meters. To obtain such results, however, the motors must be properly applied and the method of control must be suitable for the service. Machine tool builders are generally prepared to equip old line-shaft driven tools with additional parts to fit them for motor drive; with few exceptions the advantages of motor drive for such machines, if in good condition, are nearly as great as for new machines. Heavier cuts are possible with motors than with line shaft drive, but the old tools are not usually strong enough to permit taking full advantage of this possibility.

The saving to be made by installing an indivihual motor may be illustrated by assuming that the 60-in. boring mill cited in Table II was shaft driven. The machine-hour rate is $0.53, and if the workman receives $0.35 per hour, the total operating cost is $0.88 per hour, or $2,170 per year of 2,808 hours (54 hours per week). This machine if properly equipped for motor drive will give at least 20 per cent. increased output with practically no increased operating cost. Assuming that the machine's earnings are only enough to cover operating expenses, the increased earnings by motor operation will be 0.20 multiplied by $2,470, or $494 per year.

If both interest at six per cent. and depreciation at ten per cent. be considered, $494 represents a capitalization of $3,087; that is, to effect an increase of 20 per cent. in production, this amount could be added to the investment without change of net profit. This mill can be operated by a 7.5 horsepower motor, and the cost of such a motor, including a controller and the necessary changes in the machine, would amount to possibly $500 or about one-sixth the warranted investment. From the other point of view, the interest and depreciation on $500 at 16 per cent. is $80, which deducted from the total saving, $494, effected by the motor drive, leaves $414 per year net gain.

In some cases the conditions will warrant the installation of a complete new equipment instead of equipping the old tool with a motor. The new tool will require increased investment, but will make possible more rapid work by taking heavier cuts, thereby warranting the investment. Whether to equip an old machine with a motor or to install a new motor-driven tool is a question calling for careful consideration in order to obtain the best results, as improved methods of applying motors to machine tool operation are continually being developed, and should be taken advantage of when any such changes in equipment are being made.

TABLE I.—LIST OF GENERAL AND SPECIFIC CHARGES AGAINST MACHINE TOOLS.

General Charges Against Total Shop.	Charges Against Each Machine Tool.
Fixed Charges:	
Interest and depreciation on buildings and accessories.	Proportional share of total fixed charge.
Variable Charges:	
Repairs and renewals General operating expenses.	Proportional share of total variable charge
Salaries:	
Supervision. Engineering. Clerical.	Proportional share of total salaries.
	Interest on cost of tool. Depreciation on cost of tool. Cost of power for tool.

*It is assumed that machines have been installed six years, so that the depreciation is six per cent on basis of ten per cent reducing balance. See Fig. 1.

THIS MAY NOT MEAN YOU, BUT—

If you work for a man, in heaven's name, work for him. If he pays wages that supply you your bread and butter, work for him, speak well of him, think well of him, stand by him, and stand by the institution he represents. I would not work for him part of his time, but all of his time. I would give an undivided service or none.

If put to the pinch, an ounce of loyalty is worth a pound of cleverness.

If you must vilify, condemn and eternally disparage, why resign your position, and when you are outside damn to your heart's content. But, I pray you, so long as you are a part of an institution, do not condemn it. Not that you will injure the institution—not that—but when you disparage the concern of which you are a part, you disparage yourself.

And don't forget, "I forgot" won't do in business.—Elbert Hubbard.

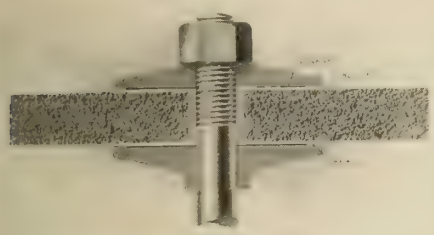
A very ingenious method of overcoming the friction of intermeshing gears has recently been devised. The gear-teeth are electro-magnetically held in engagement, without actually contacting. The teeth of the driving-gear are magnetised by means of suitable coils, while the teeth of the driven gear serve in pairs as armatures for the magnetised teeth. Of course, such an arrangement would hardly be suitable for slow, heavy work, because the cost of current would be greater than that of lubricating-oil and the loss due to friction, but for light, high-speed work the electro-magnectic engagement would undoubtedly prove very advantageous.

Grinding Wheels—Their Manufacture and Uses

Modern Grinding Wheel Practice: Mounting Wheels: Why a Grinding Wheel Cuts. From an Illustrated Talk at McGill University, Feb. 9, 1910

By E. W. DODGE

Alundum, the grit or cutting material used in the manufacture of Norton grinding wheels, is made from bauxite, a hydrate of alumina. The electric furnace purifies it and the analysis of alundum will run nearly as high as the ruby in crystalline aluminum oxide, and the higher the crystalline aluminum oxide, the greater its cutting efficiency as an abrasive.



Correct Method of Mounting a Wheel, showing Flanges One-half the Diameter and Properly Relieved.

The base of the abrasive qualities of emery and corundum is crystalline aluminum oxide. Emery contains from 35 to 40 per cent impurity in the form of iron, silica and lime. Corundum is practically a pure aluminum oxide, but is never obtained in its pure state, on account of the matrix in which it is found.

The efficiency of an abrasive does not always depend on its hardness. The resistance of its grain to fracture is its most important property. This should be proportionate to the pressure at which it is to be used. In internal grinding, where the wheel is small and mounted on the end of a slim spindle, we not only use a weak bond, but also an abrasive that will fracture easily. If the grain itself did not break so as to leave new cutting surfaces, it would be impossible to do good and fast work on account of glazing and heat.

On heavy work, such as steel castings where large wheels are used and pieces weighing from 45 to 100 pounds are thrown against them, we must have a tough abrasive that will not break down until we have reached the glazing point.

This range of toughness of grain is known by us as "temper," and an abrasive which cannot be made in different degrees of temper is not adapted to all classes of grinding.

In the making of alundum, manipulation of furnace and the mixtures which are used in it give us all the tempers required.

The mineral bauxite is a hydrate of alumina containing one-third water of combination. The water is expelled by the means of a rotary calciner, the cylinder of the calciner shown here being 60 feet in length and is heated by two gas producers, and the material being fed in from the end farthest from the fire. The material is discharged, free from water, at the producer end. The machine is continuous and will calcine 40 tons of bauxite daily.

After calcining, the ore is ready for the electric furnace. These furnaces are conical-shaped pots, which stand on a car and heated by two vertical electrodes, which are gradually raised as the molten bauxite fills the furnace. 2200 electric horse-power is used in the furnace room. When the fusion is complete, the furnace is pushed out under an electric crane, the product lifted off and placed on the cooling floor until cold enough to handle. The fusions contain about three tons of abrasive material.

In the scheme of reduction to prepare alundum for manufacture into wheels, it is passed through a series of crushers, rolls, roasters, washers, dryers and grading sieves. It must be crushed and graded to a great many sizes, which are designated by numbers ranging all the way from 10 to 200. Finer materials than No. 200 grain are called flours. The flours are used largely in rubbing and sharpening stones, razor hones, etc. The grains are numbered according to the meshes per linear inch through which they have passed in grading. By No. 30 grain is meant the size that will pass through a grading sieve having 30 meshes to the linear inch; No. 20 grain, 20 meshes, etc.

Truing is done by means of cutters of stamped steel or chilled iron, and on fine wheels or where sharp corners are desired diamonds are used.

Testing Wheels.

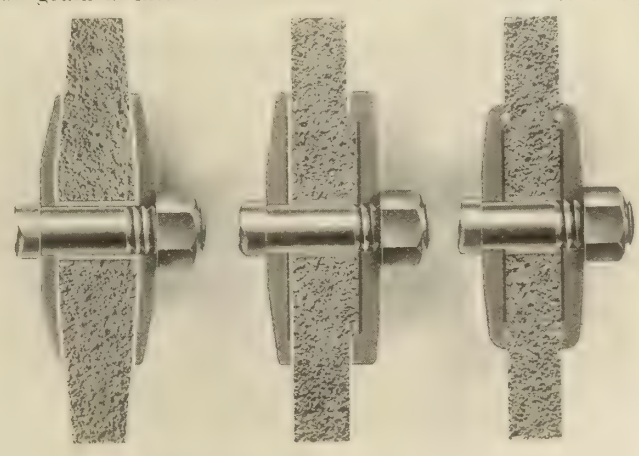
Norton alundum wheels are tested immediately before shipment at approximately 10,000 surface feet per minute. The testing is done on motor-driven machines equipped with variable speed motors, the revolutions per minute being indicated by tachometers. The bursting limits of all grinding wheels vary in proportion to their grade of hardness. Breakages do not occur in grinding wheels made by standard makers from any inherent weakness they may contain, but rather from insufficient care taken in their use and mounting.

The most common causes of accidents are: Catching of work between wheel and rest; mounting them between flanges that bear unevenly when nut is tightened; not using any flanges and simply screwing a nut against the wheel; allowing the arbors to become loose in the boxes from wear; allowing wheels to get out of truth.

All wheels are tested against standard wheels to establish their grade of hardness, special machines being used for this purpose. Every wheel is thoroughly inspected before shipment by an inspection department, and no wheel can be shipped without having passed this department and without the signature of the inspector on the order check.

Grits and Grades.

Grinding wheels are made in many combinations of grain and grade to meet the variety of conditions under which they are used. The shipping tag of each wheel bears a number and grade letter. For example, 30-M; thirty designates that No. 30 grain was used in the manufacture of that wheel. The letter of the alphabet designates the grade of hardness, which grade is determined by skilled graders, with the aid of grading machines. When the retentive properties of the bond are great, the wheel is called "hard"; when the grains are easily broken out it is called "soft." A wheel is of the proper grade when its cutting grains are automatically replaced when dull. Wheels that are too hard glaze. Dressing re-sharpens them, the points of



Three Types of Protection Flanges.

the dresser breaking out and breaking off the cutting grains by percussion.

Soft wheels are used on hard materials, like hardened steel. Here the cutting particles are quickly dulled and must be removed. On softer materials, like mild steel and wrought iron, harder grades can be used, the grains not dulling so quickly.

The area of surface to be ground in contact with the wheel is of the utmost importance in determining grade. If it is a point contact, like grinding a ball, or an extremely narrow fin is to be removed, we must use a very strongly bonded wheel, on account of the leverage exerted on its grain, this tending to tear out the cutting particles before they have done their work. If we have a broad contact, like grinding a hole or where the work brings a large part of the wheel into operation, the softer grades may be used, because the depth of cut is so infinitely small that the cutting points at work become dulled quickly and must be renewed, or the wheel glazes and loses its efficiency.

Protection Hood.

Vibrations in grinding machines cause pressure on the cutting grains, necessitating harder wheels. Wheels mounted on rigid machines can be softer in grade and are much more efficient.

Running speed in practice are from 4,000 to 6,000 surface feet, depending on work, condition of machine, and mounting. Generally speaking, grinding of tools, cutters and surface grinding, is done at about 4,000 to 5,000 feet. Snagging and rough forms of hand-grinding run from 5,000 to 6,000 feet. Cylindrical grinding, or where the work is rigidly held and the wheel feed is under control, is done at from 5,500 to 6,500 feet, and in some instances as high as 7,500 feet. These speeds apply to vitrified, silicate and elastic wheels.

Mountings.

Users of grinding wheels are beginning to realize the importance of mounting them in a safe and proper manner. Fig. 1 shows flanges one-half the diameter of the wheel properly relieved so as to bring the bearing of the flange as far out on the diameter of the wheel as possible. The rubber washers tend to take up any imperfections in the wheel or flange.

The three types of protection flanges shown are good if properly designed. The criticism of all protection flanges is that they do not prevent that part of the wheel outside of the flange from flying in case of accident. Probably the best protection for a grinding wheel is the protection hood shown. This device prevents pieces of wheel from flying all over the shop and protects the vital parts of the operator's anatomy.

Before starting up the machine after a new wheel has been mounted, care should always be taken that the belt has been shifted to the proper pulley. As a grinding wheel decreases in diameter, in order to maintain the same surface speed the belt should be shifted to a smaller pulley. The belt should never be left on the smaller pulley, however, when mounting a new wheel of larger diameter. In places where many wheels are used, instead of shifting the belt two or three sizes of machines are used and when the wheel is worn down to a certain diameter, it is changed to a machine with higher speed.

It is well to remember that the efficiency of any grinding wheel is proportionate to its periphery speed. The following notice is used in many places with good results, it being posted directly on front of the machine:

Machine Number.....
Spindle Revolutions.....
Diameter of Grinding Wheel not over ..... inches.
Take off Wheel at ..... inches.
Notify Foreman when Wheel needs Dressing.

In connection with this, it is good practice to have one man mount, change belts and dress all wheels.

Machines should also be equipped with dust systems. There are many grinding rooms in our older shops where the machines are placed in rooms without ventilation or light. Grinding rooms should necessarily be well ventilated on account of the dust. The dust system prevents wear and tear on the shafting, machinery and belts. It makes the grinders feel better and the man is just as efficient as he feels. Machines on foundations are much less liable to vibration and lack of vibration means wheel economy.

Why a Grinding Wheel Cuts.

Some idea of the reason why a grinding wheel can cut work to size in less time than the same work can be sized by the turning tool may be had when it is known that a 24x4-ft. wheel, when used on a modern machine, will remove approximately one billion, eighty-six million, one hundred and seventy-one thousand (1,086,171,000) chips per minute. It has been figured out that there are approximately one million, eighty-six thousand, one hundred and seventy-one (1,086,171) cutting points on the wheel face each cutting off a chip one thousand times per minute.

There seems to be considerable misunderstanding in the mechanical world as to what is going on when a grinding wheel is removing stock. One very often hears the expression, "This wheel cuts; it does not grind," the intention being to impress the hearer with the thought that that particular wheel has in it some virtue of cutting which other grinding wheels have not.

It is, of course, true that many wheels cut poorly, due to improper grain and grade. So do many tools which have not been correctly tempered. Because some of the cutting particles of grinding wheels are blunt or even round does not prevent their cutting.

We can all remember when we could not conceive of a lathe-tool as capable of cutting unless it had a sharp and raking edge. But modern high-speed steels have shown us that tools without sharp edges or sharp points cut off the greatest quantity of chips in the shortest time. The material of these steels and their proper heat treatment for cutting high speeds is the secret of their success.

So with grinding wheels. The material removed by a good grinding wheel is removed in the same manner as by the turning tool. It is cut just the same. With the grinding wheel, the chips are so very small that we do not recognize them as such without the aid of the microscope. The microscope clearly shows them to be shavings identical with the cuttings from steel tools, except that they are of many different shapes and angles of clearance. Some have a raking cut, some a dragging cut. In dry grinding, the chips are generally discolored from the heat. If the wheel is too hard, we find the grindings full of globules and molten metal.

Wet grinding gives us better-shaped chips and of about their natural color, indicating that the water has served to lubricate and to keep the cutting edges of the grain sharp and the work cool.

Examination will show a difference in chips of the same grade of steel ground dry from those produced by wet grinding. The chips from dry grinding usually show globules of molten steel, while those produced by wet grinding are more regular, and about the natural color of the metal.

Manganese steel is a hard and tough material which cannot be touched with any kind of a turning tool and unless an abundance of water is used, when grinding, we get burned chips.

The Design of Bevel Gears ; Shafts Acute and Obtuse

Part II. on the Design and Manufacture of the Varions Types of Gears, Giving Information and Tables of Great use to Mechanical Men.

By G. D. MILLS

This article introduces a method for the calculation of all bevel gears other than those with shafts at right angles, which has been described in Part I. The method with which the centre angles are calculated, and from which the formulas are derived, can be better understood by referring to Fig. 2. The diagram contains the two half-pitch diameters drawn at an angle which is always 180 degrees minus the angle of shafts, and the two shaft-centre lines form the balance of the quadrilateral figure, the corners of this figure have been connected by two straight lines, one of

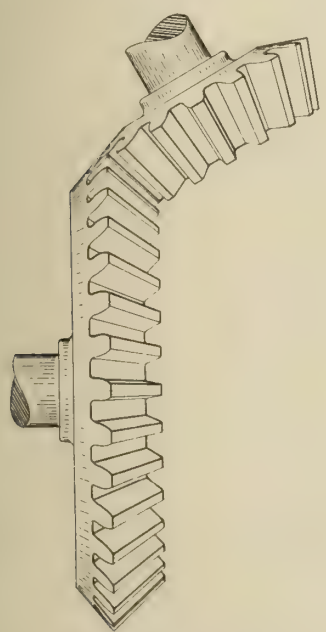


Fig. 1.—Pair of Gears, Shafts Acute.

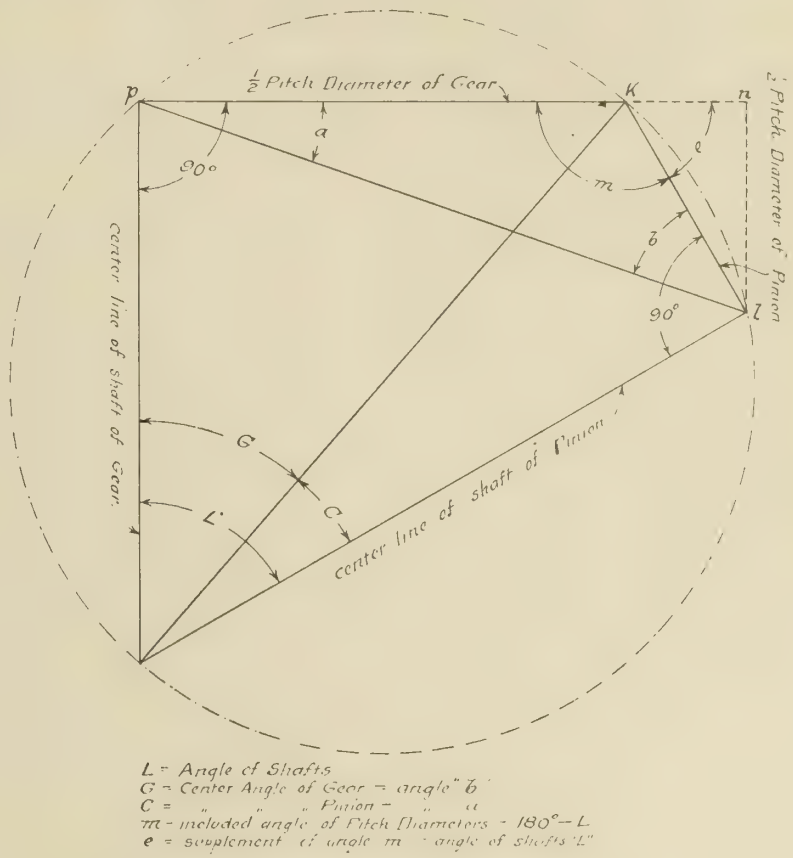
which is the diameter of the enclosing circle, divides the angle of shafts, and runs through the centre of working depth of teeth, as they mesh.

A careful inspection of Fig. 2 reveals the fact, that in order to determine either centre angle G or C, we have but to calculate angle b or angle a, and since the included angle m is always 180 degrees minus the angle of shafts L, we have the included angle and two sides, viz: the two half-pitch diameters, with which we may proceed with the operation of calculating angle a. In the right hand corner of Fig. 2, the half-pitch diameter of gear has been extended to n and a perpendicular erected to l, thus making a right triangle pnl tangent a or tangent e, is therefore the distance nl divided by the distance np, while the lengths nl and nk may be readily found by multiplying the half-pitch diameter of pinion by the sine and cosine of angle e, which is equal to the angle of shafts L_2 and from which is derived the formula for shafts acute.

$$\text{Tangent } e = \frac{N_2 \sin L}{(N_2 \cos L'') + N_2}$$

(I have substituted the number of teeth in place of pitch diameters, as in part



L = Angle of Shafts
G = Center Angle of Gear = angle "b"
C = " " " Pinion = " "
m = included angle of Pitch Diameters = 180° − L
e = supplement of angle m = angle of shafts "L"

Fig. 2.—Calculating Angles.

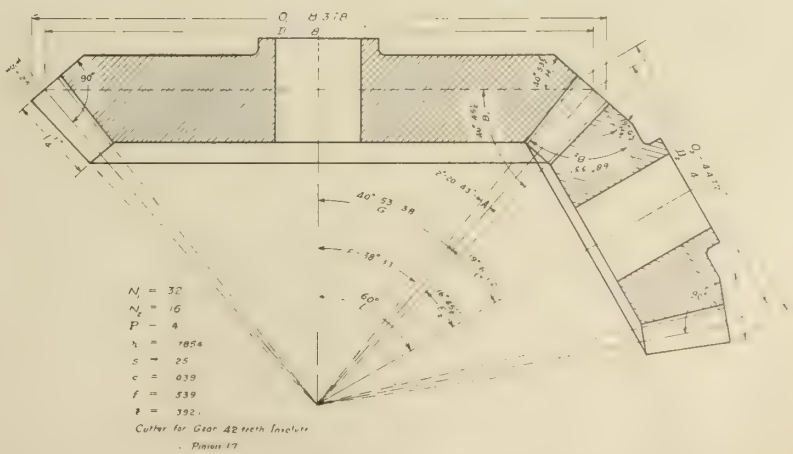


Fig. 3.—Pair of Bevel Gears, Shafts Acute.

L. Angle G is found by deducting angle C from angle of shafts L.

When shafts are at an obtuse angle, however, the included angle m is obliged to be acute and another formula required to calculate angle C, this is explained later on, there being but two formulas necessary to calculate the centre angles of shafts acute and obtuse, and from these angles all other angles may be readily found. Fig. 2 is arranged with shafts acute. A diagram of shafts obtuse presents a somewhat different quadrilateral figure, and the figure is still more complicated in broad obtuse shafts. The method, however, is correct for all three, it is proved in the 6th Book of Euclid, proposition

Fig. 4.—Calculating Gears, Shafts Acute.

33-e, also 3rd Book of Euclid proposition 21. I have deemed it expedient to prove the method, that the formulas may be followed with confidence.

Only a few years ago many gear manufacturers obtained their angles by measuring the drawing with a protractor, which method has, however, proved unreliable, and the necessity of calculating the angles, apparent.

In the three examples which follow, are arranged a pair of gears with acute shafts, and two pairs with obtuse shafts; together with a mode of procedure, which can be relied upon, to give absolutely correct results in every case.

Fig. 3 contains a pair of bevel gears with shafts at an acute angle, and following are a list of formulas necessary for their calculation. We shall proceed as in Part I. Shafts at right angles, and the same tooth formulas may be used. The diameter of blank, angle increment

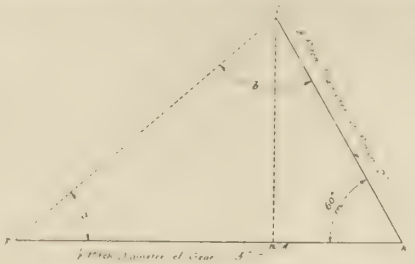

Fig. 6.—Calculating Angles, Shafts Obtuse.

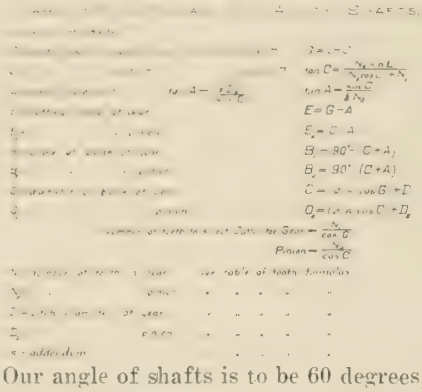
cutting angle, angle of edge, and number of teeth to select cutter from are as in 90 degree shafts. The angle of blank, however, must be found separately for each wheel, by deducting from 90 degrees the sum of the centre angle and angle increment, and the centre angles calculated first by the formulas for acute shafts.



Our angle of shafts is to be 60 degrees, and we shall select, as in Part I., 32 and 16 teeth 4-pitch and our tooth dimensions may be calculated as before, they will be found noted on Fig. 3. Before calculating the centre angles, let us briefly review Fig. 2. It has been proved that angle a is equal to angle C, and that the included angle m is always 180 degrees minus the angle of shafts L, consequently our formula only deals with the upper portion of Fig 2, which will be found in Fig. 8. Therefore tangent a or tangent C =

$$\frac{N_2 \sin L}{(N_2 \cos L)+N_1} = \frac{16\times.866}{(16\times.5)+32} = .3464$$

and its angle is 19 degrees—6'—22'' $=H_2$. Angle G is obtained by deducting angle C from angle of shafts L or 60 degrees minus 19 degrees—6'—22''=40 degrees—53'—38''$=H_1$. Angle increment is found as in 90-degree shafts, tangent $A=\frac{\sin C}{\frac{1}{2}N_2}=\frac{.3273}{8}=$ .0409, and its angle is 2 degrees—20'—43''. From these angles the others are readily found.

Cutting Angles.

The cutting angle of gear E_1=G—A or 40 degrees—53'—38'' minus 2 degrees—20'—43''=38 degrees—33'. The cutting angle of pinion E_2=C—A or 19 degrees—6'—22'' minus 2 degrees—20'—43''=16 degrees—45½'. Angle of of blank of gear B_1=90 degrees—(G+A) or 90 degrees minus (40 degrees—53'—38'' plus 2 degrees—20'—43'')= 46 degrees—45½'. Angle of blank of pinion B_2=90 degrees—(C + A) or 90 degrees minus (19 degrees—6'—22'' plus 2 degrees—20'—43'')= 68 degrees—33'. It will be noticed that the centre angles and angle increment have been calculated to seconds, in order to determine the other angles in degrees and minutes, as correct as possible. The above angles have also been noted on Fig. 3, in their proper place, and we may proceed to calculate the diameter of blanks and size cutters to select. As in Part I. 90-degree shafts, we have been obliged to wait until the angles were calculated. The diameter of blank of gear O_1=(2_1 s_1 cos G)+D_1= (2 × .25''×.7559)+8''= 8.378 inches, and the diameter of blank of pinion O_2=(2.s. cos C)+D=(2.×.25 ×.9449)+4''=4.472 inches. The number of teeth to select cutter for gear= $\frac{N_1}{\cos G}=\frac{32}{.7559}=42$, or a 4 pitch involute bevel gear cutter, which will cut 42 teeth. The number of teeth to select cutter for pinion $=\frac{N_2}{\text{Cos. C}}=\frac{16}{.9449}=17$ or a 4-pitch involute bevel gear cutter, which will cut 17 teeth.

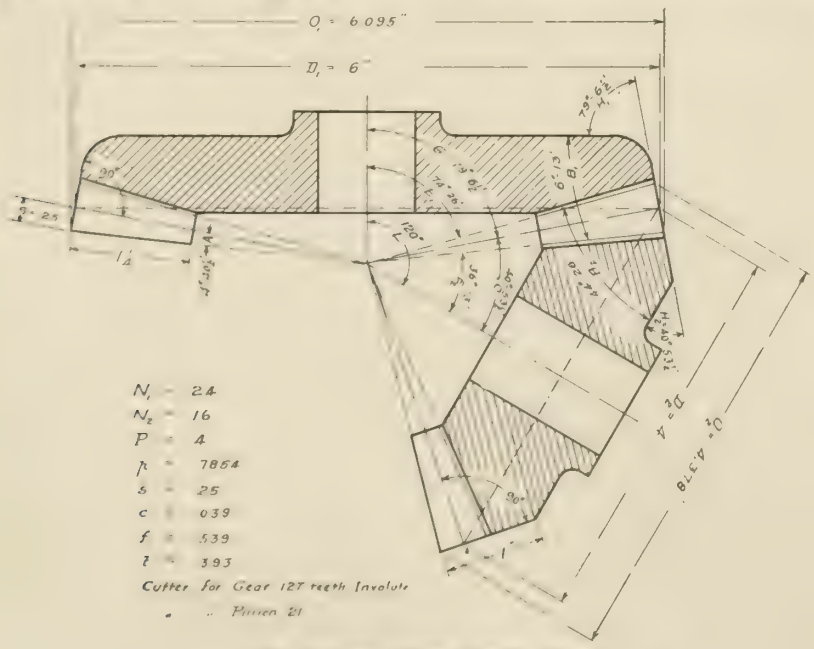


Fig. 5.—Bevel Gears, Shafts Obtuse.

Shafts Obtuse.

We may proceed with the calculations of shafts obtuse. In the diagram, Fig. 5, are arranged a gear and pinion with shafts at an angle of 120 degrees. We shall select a speed ratio of 1½ to 1 or 24 and 16 teeth 4-pitch from which the

tooth dimensions may be calculated as before, they are noted on Fig. 5.

In calculating the centre angles of obtuse shafts, we shall require another formula. The upper portion of a diagram of obtuse shafts similar to Fig. 2, would appear as in Fig. 6.

As before, we have two sides, and the included angle m, which is acute, when shafts are at an obtuse angle. Tangent a, or tangent C may be readily determined by dividing the distance ln, by the distance np and the lengths ln and nk found by multiplying the half pitch diameter of pinion by the sine and cosine of angle of shafts L, which is the sine and consine of its supplement, or sine and cosine of angle m. From this is derived the formula for obtuse shafts.

$$\text{Tangent } C = \frac{N_2 \text{ sine } L}{N_1 - (N_2 \cos L)} = \frac{16 \times .866}{24 - (16 \times .5)} = .866$$

and its angle is 40 deg.—53½'=H. Centre angle G=L—C or 120 degrees minus 40 degrees—53½'=79 degrees—6½'=H_1. The other angles may be calculated as in shafts acute, and the same formulas used. Tangent of angle increment

$$A = \frac{\text{sine } C}{\frac{1}{2} N_2} = \frac{.6546}{8} = .0818$$

and its angle is 4 degrees—40½'. The cutting angle of gear E_1=G—A= 79 degrees — 6½' minus four degrees—40½' 74 degrees — 26'.

Cutting angle of pinion E_2=C—A= 40 degrees—53½' minus 4 degrees—40½'' =36 degrees—13'. The angle of blank of gear B_1= 90 degrees—(G+A)= 90 degrees minus (79 degrees—6½' plus 4 degrees—40½')=6 degrees—13'. Angle of blank pinion B_2 = 90 degrees—(C+A)=90 degrees minus (40 degrees—53½' plus 4 degrees—40½')=44 degrees—26'. These angles have been noted in their proper place on Fig. 5, and we may conclude our calculations for obtuse shafts, by determining the diameter of blanks and size cutters to select.

The diameter of blank of gear O_1=(2. s. cos G)+D_1=(2×.25''×.1889)+6''= 6.095 inches. The diameter of blank of pinion O_2=(2. s. cos C)+D_2=(2×.25 .7559)+4''=4.378 inches. The number of teeth to select cutter for gear—

$$\frac{N_1}{\cos G} = \frac{24}{.1889} = 127$$

or a 4-pitch involute bevel gear cutter, which will cut 127 teeth. The number of teeth to select cutter for pinion

$$\frac{N_2}{\cos C} = \frac{16}{.7559} = 21$$

or a 4-pitch involute bevel gear cutter, which will cut 21 teeth. These have been noted on the diagram, Fig. 5, which completes the calculations.

In bevel gears with shafts at an obtuse angle, there is another condition, which frequently arises when shafts are broadly apart, viz.:—the gear becomes what is known as an interior gear. In the diagram, Fig. 7, we have this peculiarity.

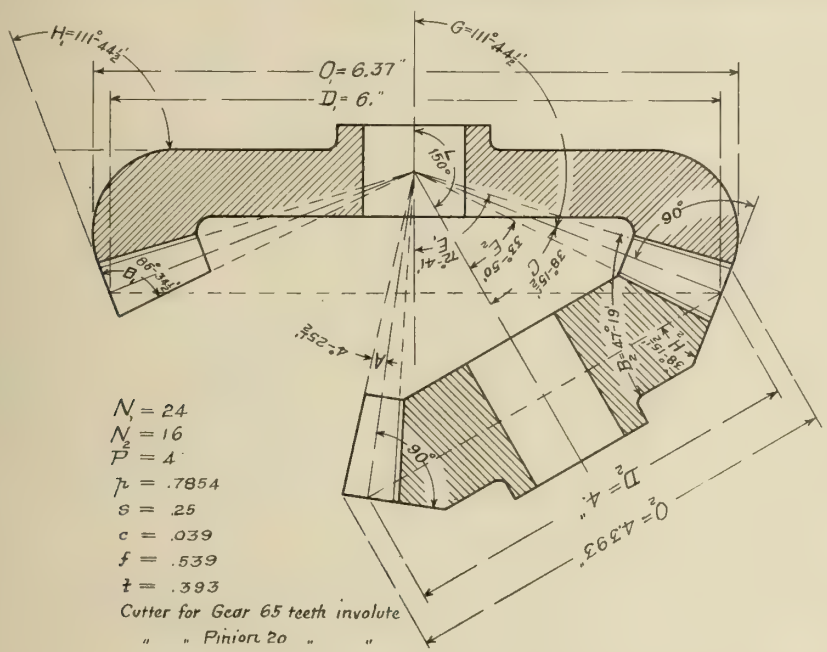

Fig. 7.—Interior Gear.

The angle of shafts L, Fig. 7, is 150 degrees, and we shall select 16 and 24 teeth 4-pitch, as before; from which we obtain the same tooth dimensions, and they are noted on Fig. 7. Our centre angle is calculated as before, with the formula for obtuse shafts. Tangent C=

$$\frac{N_2 \text{ sine } L}{N_1 - (N_2 \cos L)} = \frac{16 \times .5}{24 - (16 \times .866} = .7886$$

and its angle is 38 degrees—15½'=H_2. centre angle G=L—C= 150 degrees minus 38 degrees—15½'=111 degrees—44½'=H_1. The tangent of angle increment A

$$\frac{\text{sine } C}{\frac{1}{2} N_2} = \frac{.6192}{8} = .0774$$

and its angle is 4 degrees—25½'. The cutting angle of the interior gear E_1=G—A=111 degrees—44½' minus 4 degrees—25½'=107 degrees—19'. This angle, however, cannot be used to set our gear cutter or milling machine, as our graduations only extend to 90 degrees. The angle to set is, therefore, its supplement, or 180 degrees minus 107 degrees—19'=72 degrees—41'. Cutting angle of pinion E_2 =C—A=38 degrees—15½' minus 4 degrees—25½'=33 degrees—15''. The angle of blank of gear B_1, we are obliged to make the included angle between the edge line and face of teeth in a wheel of this description, that it may readily serve its purpose in trying the blank with a protractor B_1, therefore equals 90 degrees —A=90 degrees minus 4 degrees —25½'=85 degrees—34½'.

Angle of blank of pinion B_2 is as before, 90 degrees—(C+A)= 90 degrees minus (38 degrees—15½' plus 4 degrees —25½)=47 degrees—19'. Those angles will be found noted in their proper place on Fig. 7, and we may conclude our calculations for this pair of gears by determining the diameter of blanks, and number of teeth to select cutters from. In the case of the interior gear, the distance across the bottom of blank or diameter of point of tooth circle, is found to be within the space necessary to construct the blank; while it has formerly served as the outer diameter. This distance is equal to D_1—(2. s. G = 6'' minus (2×.25,''×.3704)=5.815 inches. The edge line may be turned from this circle outward at an angle of 111 degree—44½', or (centre angle G) with respect to the horizontal or bottom of blank.

We must, however, first find the diameter of blank, and may proceed, as in former cases, O_1=(2. s. cos G)+D_1=(2 ×.25×.3704)+6''=6.185 inches. This diameter will be found to be inadequate to properly extend the edge line and round the corners in this style of a wheel, and we shall have to add as much more to the pitch diameter, or (.185×2) +6''=6.37 inches, which will be our diameter O_1. The diameter of blank of pinion is as before O_2=(2. s. cos C)+ D=(2×.25×.7852) + 4 = 4.393 inches. The number of teeth to select cutter for

$$\frac{N_1}{\cos G} = \frac{24}{.3704} = 65$$

teeth and the number of teeth to select cutter for pinion

$$\frac{N_2}{\cos C} = \frac{16}{.7852} = 20$$

teeth, and they have been noted in their proper place on Fig. 7.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

TOOL REST FIXTURE.

By Frank E. Booth.

Some time ago the writer had occasion to bore three small cylinders, on the face plate of lathe. The job was such that it was necessary to have a long rigid boring tool in order to machine certain parts properly. The lathe being equipped with an ordinary tool holder as represented in Fig. 2, allowed the use of only a moderately sized tool.

The difficulty was overcome in the manner shown in Fig. 1. In the sketch, the part marked R represents the solid tool rest which takes the place of the compound rest on the lathe.

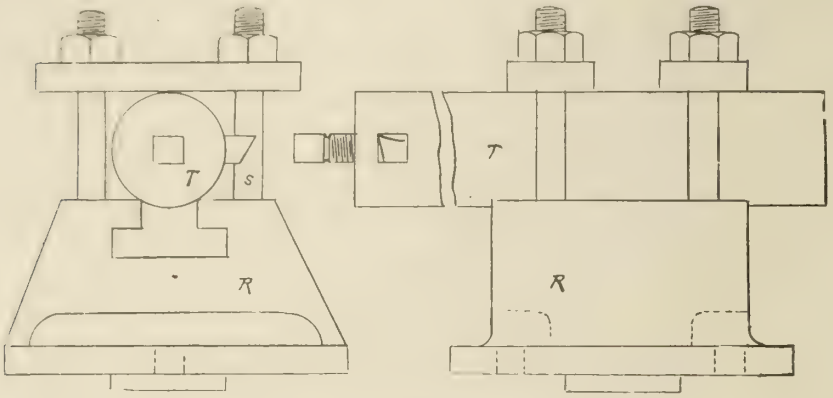

Fig. 1.—Arrangement of Tool.

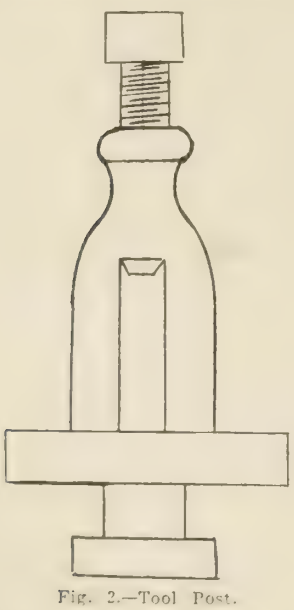

Fig. 2.—Tool Post.

Four holes were drilled and tapped in the top face of this casting, and studs were inserted, as shown in sketch. A tool as large as required could then be clamped as shown in Fig. 1, lying in such as job work, and it takes but a short time to rig it up.

Fig. 3 shows a good way to clamp cylindrical work to the machine table, when V blocks are not to be had. Two pieces of round, straight stock A and B as long or longer than the job, are laid in the slots of table and work placed, as shown in the sketch and clamped down.

The two pieces A and B act as a V block, and are much quicker to handle than the ordinary V blocks. They hold the work parallel to the traverse of table requiring no adjusting in that direction, while setting up the job.

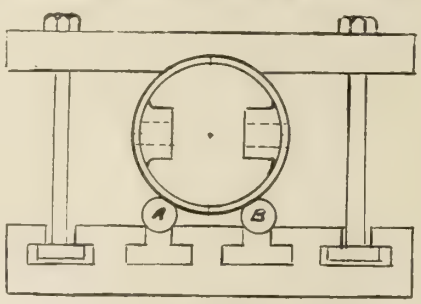

Fig. 3.—Clamping Cylindrical Work.

ANGLE PLATE.

A convenient angle plate has been devised by Robt. McKechnie, superintendent of the Smart-Turner Machine Co., Hamilton, which is giving good service. The dimensions of the one principally used by them are given in Fig. 1.

The two plates are locked together in any desired position by tightening the nut on the end of the pin, thus drawing the pin D against the inside lug of the plate A. The plates may easily be set parallel, at right angles or at any special angle for work to be done by using index pins.

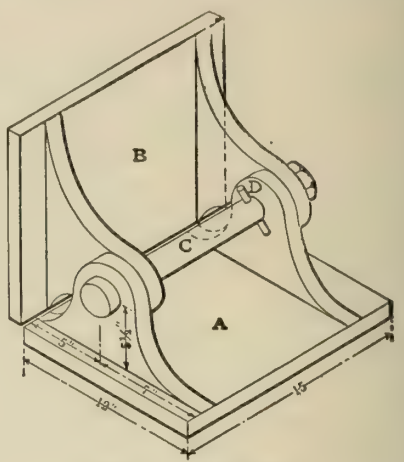

Fig. 1.—Angle Plate.

Figs. 1 and 2 show the plates in use on a planer, the shaded portions being machined. The plates are used to secure the right angle, and the work is blocked in Fig. 2, by the insertion of a small block D. After maching one side, the crosshead is then turned half way around without changing the angle plate.

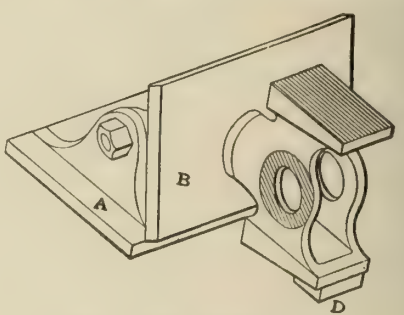

Fig. 2.—Angle Plate in Use.

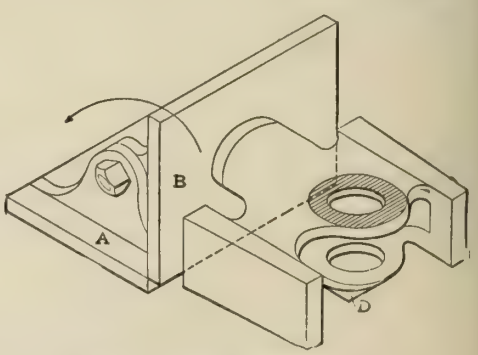

Fig. 3.—Angle Plate in Use.

In Fig. 3, the sides to be machined are parallel. The plates are set at 90 de-

grees, and when one side is planed one plate is swung in the direction of the arrow, and the other side is machined. The work is blocked up at D. This convenient angle plate has a variety of uses, the one illustrated being only an example.

TOOL FOR PLANER.

By Wm. Silk.

The tool illustrated in Fig. 1 is used to plane underneath saw carriages. An idea may be obtained of the work ob-

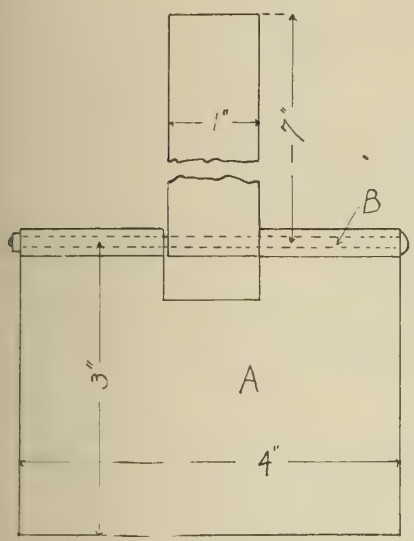

Fig. 1.—Tool for Planer.

tained by a reference to Fig. 2 which shows a sectional view of a saw carriage. I designed this simple jig some time ago, making it from sheet iron and it has given good service ever since.

The tool rests on A and planes underneath. Then it catches on the end of the work and rides on top until it comes to the other end when it reverses, letting the tool fall down.

The part A swings on the ⅜-inch bolt, the top arm being held in the tool-

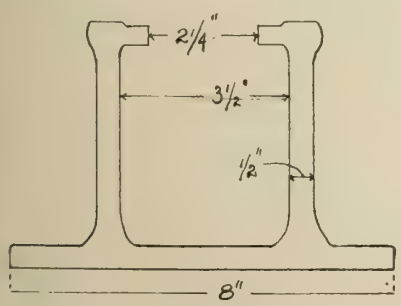

Fig. 2.—Section of Work Planed.

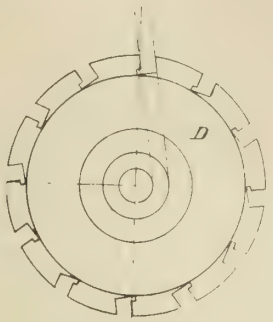
holder of the planer. Right and left nose tools are used for the work to machine underneath the left and right sides of the saw carriage.

HIGH SPEED PIPE TAPS

By F. E. Lauer.

The following article and sketch shows a favorite form of sectional pipe tap in detail and its efficiency as found by the writer. On account of the small diameter of the holder, only three blades are

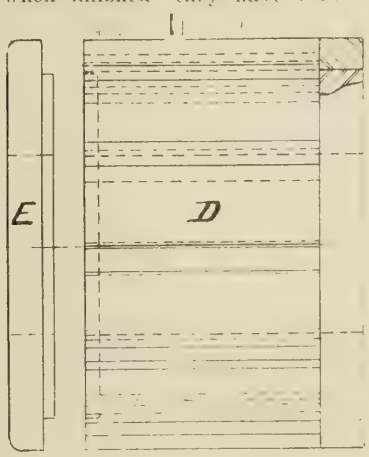


High Speed Pipe Tap.

used and this will be found much better than four or more. It gives more strength and produces a rounder hole.

The body A is made from cast steel, as a machine steel cannot hold its rigidity in small section as this size tap with the heavy work that high speed steel puts it too. B shows the inserted blade made from ¼" x ⅜" high speed steel 2¼" long. C shows the clamping or locating collar which is made from cast steel or case hardened machine steel. D shows the chuck which is used for chasing the blades, and the lay out so as to get a clearance on the blades. E shows the collar for clamping blades while they are being machined.

Four sets of blades are done at a time and when finished they have .010" ap-

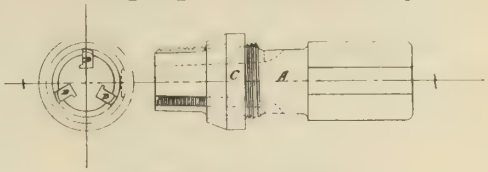


High-Speed Pipe Tap.

proximate clearance which produces a fine clear cutting tap for cast iron, while no dount the same clearance would work efficient on steel. The tapping diameter of an 1" pipe tap is 1 3-16" approximate which give us a periphery of 3.75".

This tap is designed to run at 45 feet per minute which means that it travels 144 revolutions per minute. A fairly heavy lubricant is used on this work and a tap can stand a ten hour run on cast iron fittings. A tap at this speed going into a fitting eight threads can make the complete cycle in six seconds, which shows the possibilities of high speed steel.

The machine that drives these taps is geared so as to feed the spindle the same pitch as the tap. It will be noticed that the cutting edge of the blades is placed



High-Speed Pipe Tap.

1-16" ahead of the centre line. This was done so as to give the tap holder a stronger section and also to reduce the clearance on the blades. If in this tap a blade breaks or gets worn, it is easily changed, the collar C is slackened off and the blade removed, the new one being immediately located by the threaded collar C, and if the end is in advance of the other blades it is ground off to suit. If it is back of the others the collar is again slackened and the blade brought forward sufficiently so as to allow itself to be ground in proper relation to the other blades.

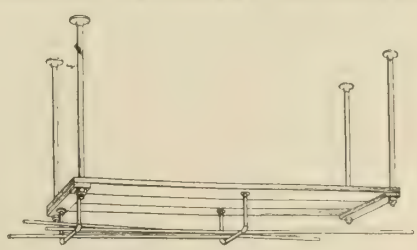
If this tap is properly made it will be found a valuable addition to any first class shop. I would recommend the following number of blades for sectional pipe taps from 1" to 2".

1" pipe tap—3 blades—144 revolutions.
1¼" pipe tap—4 blades—115 revolutions
1½" pipe tap—5 blades—100 revolutions
2" pipe tap—6 blades—72 revolutions.

This article is not a write up from theory, but is in every day use.

PIPE SHELF.

The shelf illustrated herewith is used to store things that accumulate in a small shop. The additions at the bottom are for bar iron or pipe. The shelf itself is suspended from the ceiling with ¾-in. gas pipe, which is secured to the ceiling with floor flanges. The lower ends of the pipe extend through the board and the braces at the ends, which



Shelf Suspended from Ceiling for Bar Iron, etc.

are secured with nuts. The shelf is 8 ft. long and 3 ft. wide.

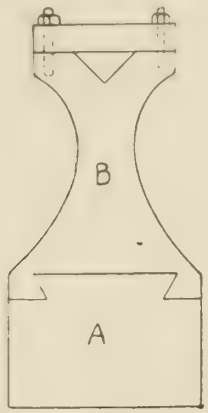
The extensions on the under side of the shelf are made of ¾-in. gas pipe, se-

cured to the shelf with floor flanges. L's are used to form the unions. The extensions are 4 ft. apart and are used to support small sizes of gas pipe and bar iron. The shelf is about 8 ft. from the floor and the extensions a foot lower.

WELDING CRANKSHAFTS.

In connection with oxy-acetylene welding at Charles Potter's, 85 Yonge St., Toronto, they use a jig for welding crankshafts which may be used to advantage in many machine departments.

The jig consists of a long base A on which are four top pieces B. These

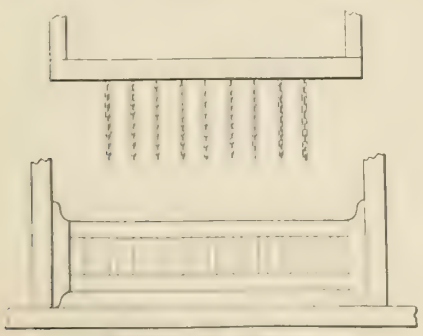


Jig for Holding Crankshaft.

may be arranged in any position on A suiting the length of the shaft. The shaft is securely fastened in the V-top. The block at the top is fastened by two screws. The crankshaft parts can then be easily set for welding the parts together. This jig has many other applications, for it may be used on a planer for crankshaft and other work.

ESCAPING THE ELEVATOR.

Perhaps the cheapest and most convenient device used for forewarning the lowering of an elevator is shown in the



Escaping the Elevator.

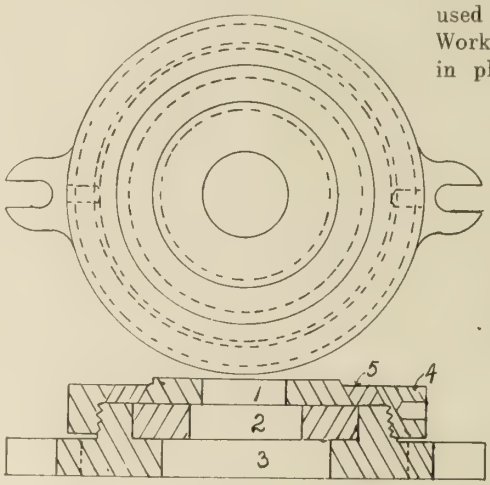
engraving. A number of small chains, about two feet long, are hung from the bottom of the cage. If the elevator is coming down, and an attempt is made by the user to look up from the gate, when the elevator is within a short distanhe from his head, he will have time to avoid a serious, or perhaps fatal, accident, because of the warning given by the lowering chain. Of course, it will be understood that the height of the gate is often limited by the distance between the floors. This device is in daily use, in at least one factory, and doubtless if it were installed in many more, a large number of elevator accidents could be prevented.—Machinery.

BOLSTER PLATE.

By L. Bailey.

In constructing blanking and drawing dies it appears to be customary to use very heavy cast iron bolster plates, and in this way using a large quantity of iron and also a lot of room for storage of such dies. For this reason the writer has made a bolster that has proved a very satisfactory remedy for these evils.

The sketch herewith shows a bolster and also a blank-holder plate. This bolster holds dies 8-inch diam. and smaller, therefore it can be seen at once, that the cost of making dies will be greatly reduced by using a bolster that will dispense with a separate bolster for each die. The sketch is about quarter full size.



Bolster Plate

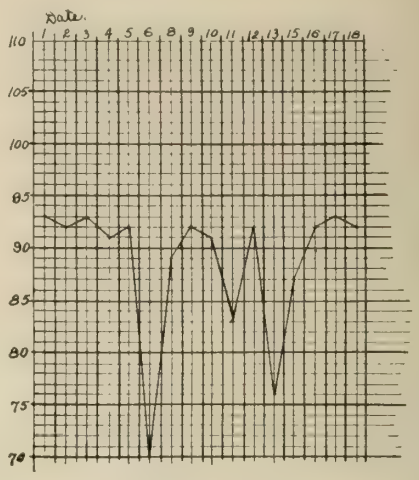
No. 3 is the base plate with a 10 pitch thread as shown. No. 4 is a ring to screw on No. 3. Smaller dies are held in place by the use of a reducing ring No. 5 and a reducing plate No. 2 as shown.

A drawing die with wide margin as shown at No. 6, it is held in place by a section ring No. 7 as shown at No. 8. When using a large die No. 6, lay die down, place No. 4 on top of die, put section ring No. 7 in as shown, then screw in base plate and the die is ready for use.

ATTENDANCE GRAPH.

At the Canadian Locomotive Works, Kingston, a graph is used to show the daily, weekly and monthly attendance in the various shops. The accompanying illustration shows the method of carrying out the attendance graph.

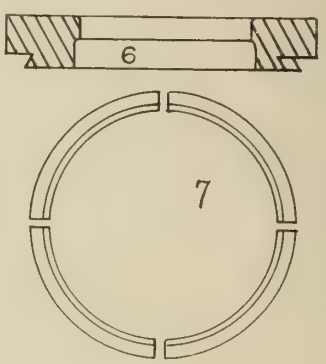
The vertical line represents the number of employes and the horizontal line the days, each day being represented by



Attendance Graph.

two spaces. This may be varied, however, as desired taking one or more divisions for each day.

Section line paper, 10 to the inch is used at the Canadian Locomotive Works and is found convenient for use in plotting. The graph is applied to

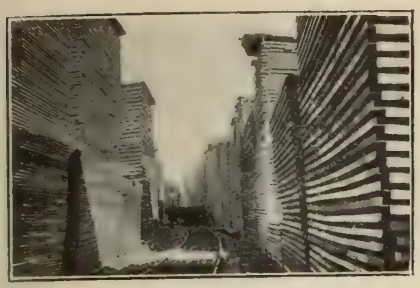


each shop, but may be enlarged to include the whole works. After the lines are plotted for each day, an average for the week may be plotted or for the month.

HANDLING LUMBER.

The accompanying illustration shows an economical method of handling large quantities of lumber. The Muskoka Wood Mfg. Co., Huntsville, Ont., have a switch of the G.T.R. running into their lumber yard, and are thus in a position to handle their lumber quickly, and in large quantities on trucks. In the view are shown quantities of lumber piled for drying. The advantages of inter-

factory communication including tracks through the yards, are clearly demonstrated in the quickness with which the company disposes of the products of

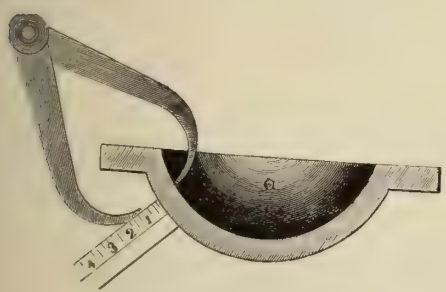


Handling Lumber.

its sawmill, and again brings the lumber to the factory to be made into woodenware.

MEASURING WITH CALIPERS.

The manner of calipering a casting with the aid of a scale is shown in the accompanying illustration shown in one of the publications of the Industrial Book Co., New York. In the case shown, calipers alone will not do the work, and



Measuring With Calipers.

a scale must be used in addition. Here the thickness of the bowl is less than the flange, and the calipers will not pass the flange after calipering the bowl.

CUSHMAN CHUCKS.

Chucks are made to suit the class of work to be done and in listing the lines manufactured by the Cushman Chuck Co., Hartford, they have prepared tables giving various dimensions of them. They are issued in catalogue form making a very handy volume of reference. The many types are illustrated, the lines manufactured including independent 4-jaw chucks, reversible face-plate jaws, geared scroll chucks, drill chucks and chucks for special machines.

DAILY BALANCE OR PRODUCTION SHEET.

A daily balance is often found necessary in a large works. Such a balance must be complete. The details must be clear, so that if the work gets behind or there is a delay from any cause whatever, it can be at once detected. For instance if the capacity of the drills is not sufficient to keep up the work it would be easily detected from a production card like Fig. 1, and if the work is not carried on fast enough to finish the contract within the stipulated time, superintendent can see at a glance how much work has been finished in each department. This production should be kept by the foreman and a clerk can take off a copy for the superintendent. An illustration will give the best idea of this card.

Fig. 1.—Production Sheet.

either working overtime must be resorted to or a new drill must be added to the equipment.

This production sheet may be easily arranged to suit an Agricultural Implement Works as in Fig. 2. A column along the side gives the list of machinery, etc., thus, mowers erected, cutter bars assembled complete, rake axles fitted complete, etc. A sheet is necessary for each department. For instance the blacksmith shop requires a sheet with a list of the work completed in that shop. The dates should be arranged along the top and should be for two weeks or for as long as the management find convenient. The totals are carried forward from sheet to sheet so that at any time the foreman or

This card would have to be made suitable for the information wanted. In the machine shop or carpenter shop, different lists would probably be required for the important parts of different machines. This production sheet is hardly suitable for a foundry where all separate castings must be kept track of, good and bad, in order to see when the factory order for each particular casting is complete. In the foundry a production card should be made out for each casting and filed according to the number of the pattern under each machine. A very simple card showing the number of castings on order, a column of good castings completed each day, and a column of totals is all that is necessary for a foundry production card.

Interesting Machine Work at John Bertram & Sons

Turning a Large Worm on a Lathe; Machining a Large Gear on a Slotter; Home-made Grinder and its Work; and Cutting Racks on a Shaper.

Some interesting methods are used in the works of John Bertram & Sons, Dundas, Ont., in connection with the manufacture of machine tools.

Fig. 1 shows a large worm being cut on a lathe. Holes are bored at the beginning and end of gear to allow the tool

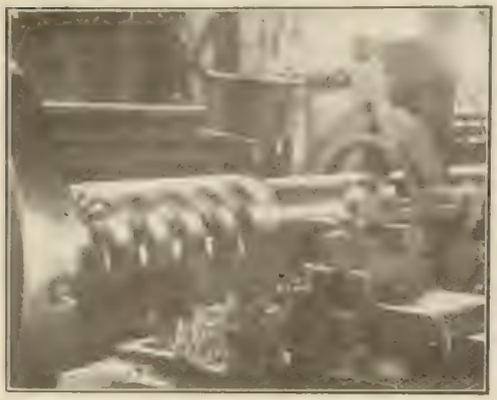

Fig. 1.—Machining Out Large Worm.

to start and for clearance at the end of the operation. Fig. 1 shows the worm before finishing and Fig. 2. shows the finished gear. In the foreground is shown the tool used, the nose being forged the angle of the finished worm.

Fig. 3 shows a large Bertram slotter of which is being cut a large gear. The roughing and finishing tools are shown

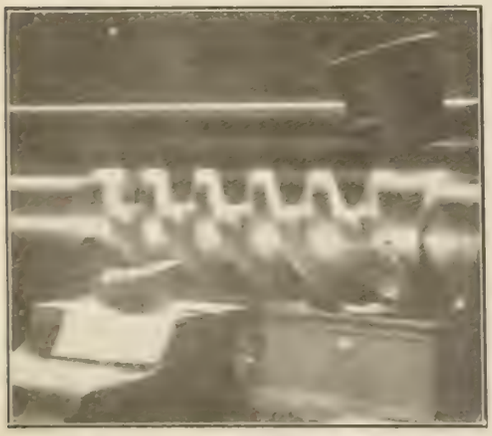

Fig. 2.—Finished Worm and Gear and Tool

on the slide of the machine. The former tool has stepped edges while the latter has been given a better cutting edge by being hollow ground on top.

In the lower right hand of Fig. 3 is shown the feed mechanism which moves the work forward toward the tool. There is a device which automatically prevents the tooth being cut too deep. The wheel A is a visible indicator and is convenient for setting the machine. It shows the operator the position of the feed at a distance.

Next to wheel A is a pinion which meshes into the gear B. B has an annular T-slot as shown carrying the stud C. When this is set properly, it strikes the arm D which controls the shield E and automatically moves E to cover the notches in the feed wheel F, all further movement of the feed screw being thus prevented.

The arrangement of the tool blocks in the ram is shown in Fig. 4. This ensures its being held rigidly in position during the cutting stroke. Tool block A is pivoted at P and at the upper end has an extension surrounding the cam D. Fixed on the side of ram support is the rack B, and in this, the gear C, mounted on a stud in the ram itself, gives motion to a gear which drives the cam shaft D by friction washers, so that it can slip, after the cam D has been forced into place.

When the ram starts downward, gear C revolves in the direction of the arrow and drives the gear on D in the opposite direction, throwing the point of the cam against the hardened incline block E, which forces the upper end of the tool block solidly against the ram and ensures the cutting tool being held in proper position during the cutting operation. When the ram starts on the return stroke, the cam D is thrown up, allowing the upper end of the tool block to be forced out by a powerful stroke thus relieving the tool on the return stroke. The desired clamping effect is secured by adjusting with a screw the block E.

Figs. 5 and 6 show a home made grinder in use in the Bertram shops. It is very serviceable, the board at the

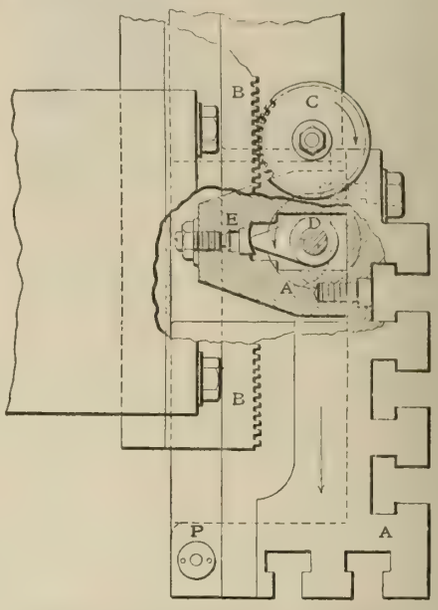

Fig. 4.—Tool Lifting Apron of Slotter.

back giving an idea of the wide range of work that may be accomplished on it. Fig. 5 shows the machine at work on a rack-cutting tool. A rack-cutting tool is shown also at the left of the grinding

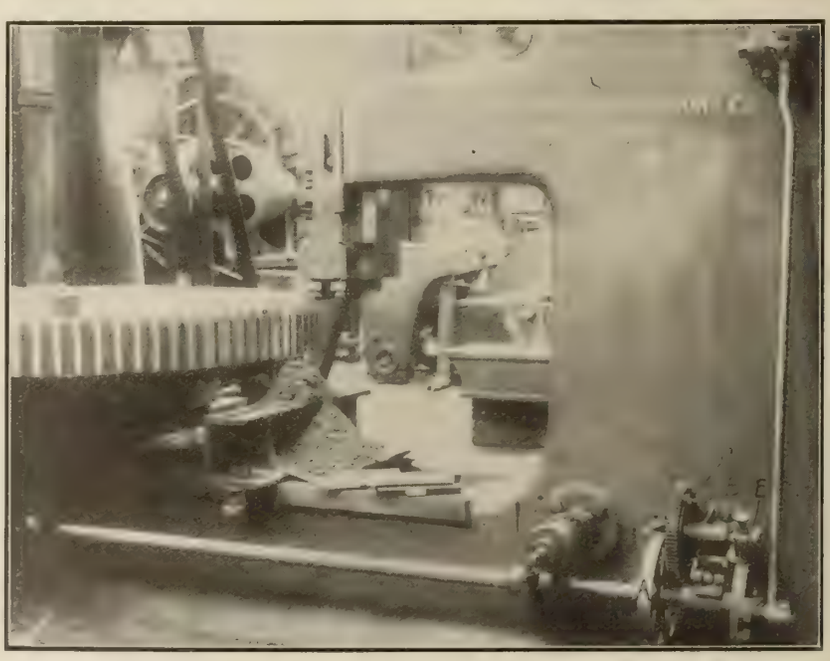

Fig. 3.—Cutting Large Gear on Slotter, John Bertram & Sons.

wheel and gives an idea of how it is ground. Fig. 6 shows it grinding a small cutter. The machine is conveniently operated, has lever feed and easily adjustable stops.

Fig. 7 shows a method of cutting racks on a shaper with a traversing head. A

second table is utilized for holding the racks to be cut, and a large index wheel placed on the traversing screw ensures accurate spacing.

The tool holder and tool are interesting. The tool holder replaces the ordinary clapper back and swings from the same point, being lifted out of the work and held during the return stroke by the

Fig. 5.—Home-made Grinder Grinding Rack Cut er.

spring at the top. The tool is held rigid during the cut by using the cam A, operated by the arm B through the lever C, which is controlled by the two collars striking the stationary support at the end of stroke. Thus the cam is automatically forced against the upper end of the tool holder, supporting it rigidly during the cut and is automatically withdrawn just before the return stroke. The tool is fed down to a positive stop.

Figs. 7 and 8 show the tool which is of multiple design. Each tooth is relieved, each tooth taking a chip similar to the broching machine. A rake is ground on the cutting-edge of each tooth

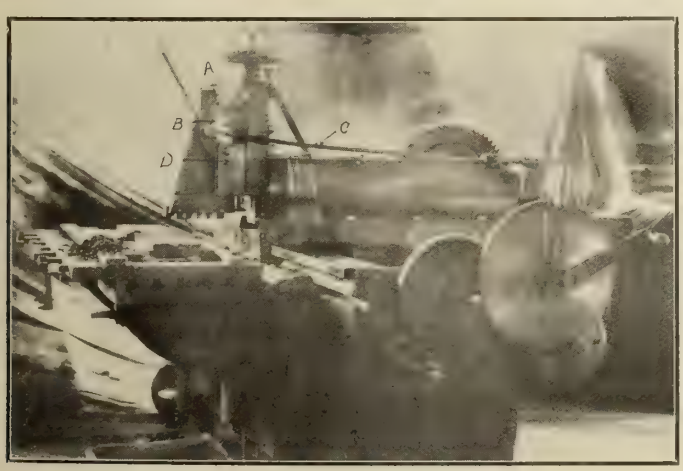

Fig. 7.—Cutting Racks on a Shaper, John Bertram & Sons.

and this is alternated to equalize the side thrust when these are in the cut and the result is a good cutting action.

A STEPPING STONE TO SUCCESS.

By Tom L. Johnston.

There are plenty of good mechanics who are plugging away in small shops for low wages, who could hold good jobs in large shops at good wages, but they do not know what is going on outside of their own little sphere. There are technical journals pertaining to almost every trade, and if these mechanics would take them and study them they would keep abreast of the times and get out of the rut they are liable to be in all their lives. Some of them turn out good work, considering the material they have to work with, but it is always the same old style, and if they were put in a first-class shop with every labor-saving device at hand they would not know where they were at.

I know of one young printer who was working in small shops for nine and ten dollars a week, but who was wide-awake and studied every journal relating to his trade he could get his hands on, and is now holding a permanent position at twenty-five dollars a week.

There is more to be learned from a trade journal than one thinks, until they begin to take an interest in it and then they would not be without it.

I once heard a grocer say he would feel like a preacher without a Bible if he did not get his trade journal, so it is quite evident a man in any line of work can profit by taking some journal devoted to his trade.

NEW PATENT WIRE LATHING.

The B. Greening Wire Co., Hamilton, have just secured a patent on a new trussed hard steel wire lathing, in which are contained the best features of the general products of this class. It is supplied in continuous lengths up to 100 yards, with a selvage on each side and in widths to suit the spacing of the studs or joists. There are many special points of interest in connection with this lathing. The selvages are stapled or nailed along the studs or joists, consequently there is no lacing. Owing to the truss formation of the lathing, it may be stapled or nailed directly along the studs, joists or sheathing without

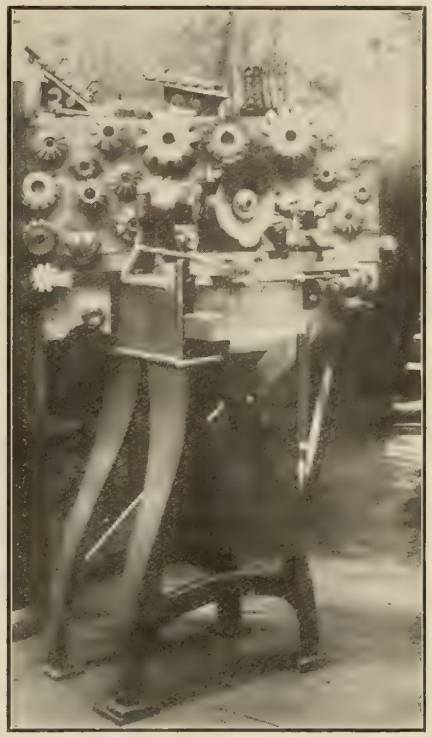

Fig. 6.—Grinding Small Cutter and Other Cutters Machined on Grinder.

any furring—a feature of great importance—and the absence of the lapping, lacing and the furring largely ensures the lowest possible cost in erecting. It has been successfully applied to 16-inch centres, and the saving thus effected is an important factor in the cost of building, but even 18-inch or 20-inch centres could be used by substituting a heavier grade at a slight advance in price.

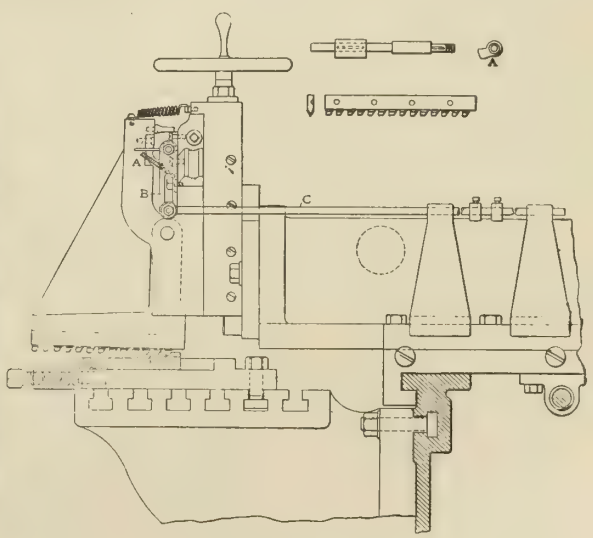

Fig. 8.—Rack Cutting Device of Shaper.

H. P. Hoag for the past two years superintendent of Fairbanks-Morse Mfg. Co., Toronto, has accepted a similar position with the Goold, Shapley & Muir Co., Brantford.

Several Jigs and Tools Used in Railroad Shop Work

In Repairing Locomotives Quickness and Accuracy are Assisted by Designing Jigs and Tools to Facilitate Work—Several are here Illustrated.

By GORDON C. KEITH

On several occasions reference has been made to the G T R shops at Stratford They contain many interesting methods, machines and systems which are above the ordinary In locomotive work it is the aim of the companies to keep the locomotives on the road and in the repair shop as little as possible. With this in view many jigs, tools and devices have been evolved to facilitate the work and hurry the repairs with a speed consistent with good workmanship so that the locomotive will not have to again enter the shop for repairs for some time.

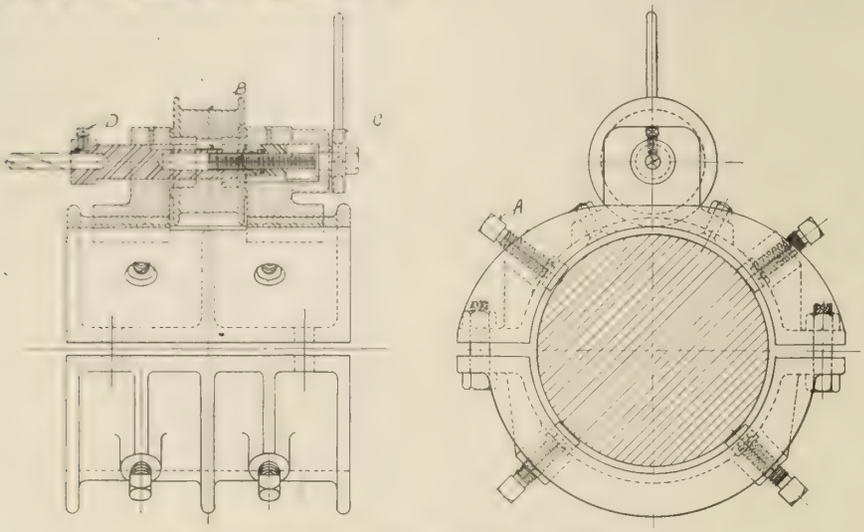

Fig. 1.—Arrangement of Hub Liner Drilling Machine.

Jigs and tools made specially for the work are therefore as indispensable a factor in doing the work economically as in manufacturing establishments. Some of the jigs, at least, described in this article are original, being designed in the Stratford shops.

Hub Liner Drill.

Fig. 1 shows the arrangement of a hub liner drilling machine. This drills the liner and axle box without removing the box from the shaft Provision is made for clamping the machine over the axle, the two parts being fastened in position by two bolts on either side of the drilling machine.

Adjustment is made by eight screws A shown in the illustration. The power is delivered from an overhead shaft by a belt, to pulley B. The drill is fed by the ratchet C. A small screw D holds the drill in place, the drill being easily replaced by a reamer for finishing if necessary. There are two of these machines so that the liners on both boxes may be drilled at the same time

Ball Joint Floating Reamer.

A toggle joint for reaming holes on a drill is shown in Fig 2 A 2½ inch ball works in the socket, the general design being shown in the illustration. No sizes are here given as dimensions can be made to suit the work to be done.

The steel pins are hardened steel. The drill takes a standard Morse taper drill. One side is flattened to hold reamer and keep it from turning.

Multiple Tool.

A multiple tool is shown in Fig. 3. A is the distance between tools, which may be varied by a movable block. In the illustration they are $\frac{7}{8}$" apart but by inserting inch blocks the tools are then kept one inch apart.

The tools are held in place by the tapered wedge B After the last tool is put in place, the distance between the tool and hole is made up by inserting an iron block and the wedge is then driven in place.

The tool is here 3-16" wide but any width tool may be used depending on the work to be done. The tool is 13½" long with a standard taper top.

Chuck Extension.

On a boring mill it is often desired to bore work which cannot be chucked on the face plate of the boring mill. This can be done by using four castings similar to Fig. 4. These slip over the jaws on the boring mill and the larger work can then be easily gripped for boring.

Fig. 5 shows the body casting and gears of an angle drill and Fig. 6 shows

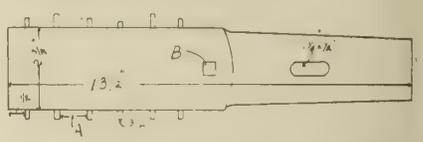

Fig. 3.—Multiple Tool.

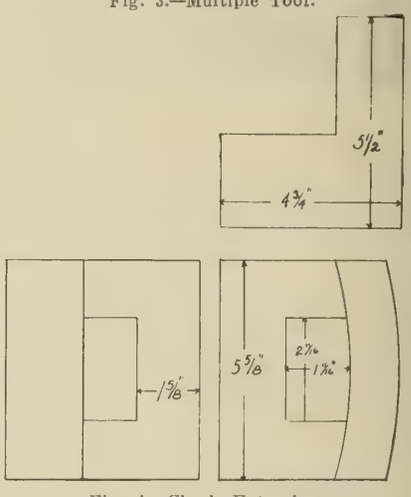

Fig. 4.—Chuck Extension.

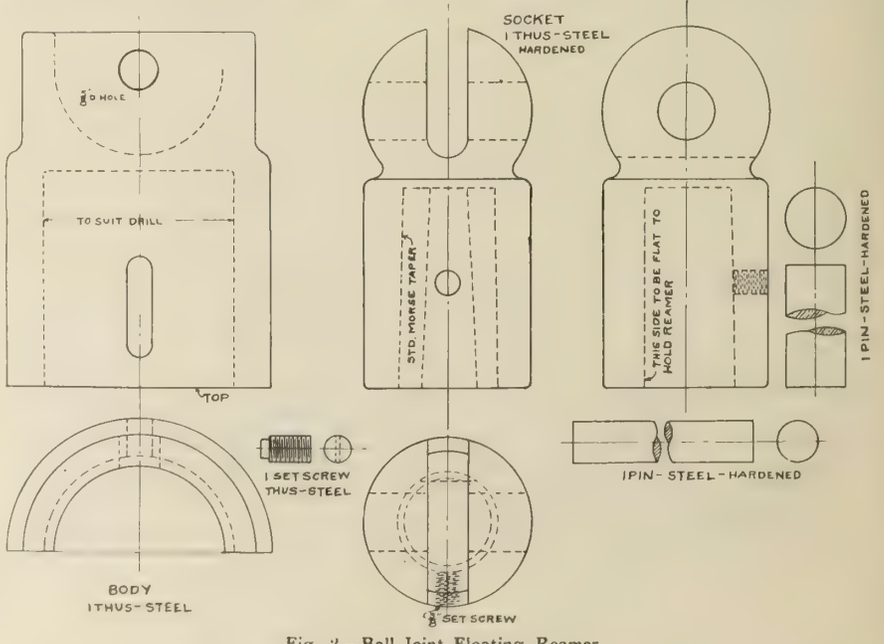

Fig. 2.—Ball Joint Floating Reamer.

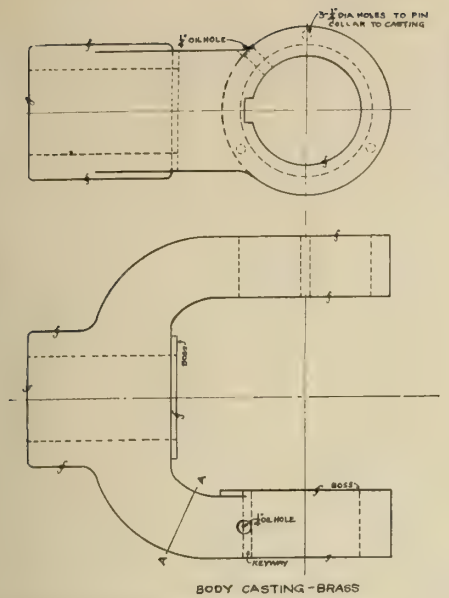

Fig. 5.—Right Angle Drilling Attachment.

the details of the angle drill. For right angle drilling, the feed is from the top of the drill, the drill spindle moving freely independent of the drive.

The large gear has a pitch circle diameter of 4.3125", number of teeth 27, diametral pitch .1597 and depth 11-32" full. The pinion has a pitch circle diameter of 2.875", number of teeth 18, diametral pitch .1597 and depth of teeth 11-32" full.

Turning Axle Box Brasses.

In the jig shown in Dig. 7 for turning axle box brasses, the brasses are placed against the metal post B which is 12½" high x 7" diam. The distance between the brass and cap A is filled in with blocks and the cap A is screwed down and fastened by three bolts. The cap is 10½" diam. The jig is fastened to the face plate of the boring mill on which the work is done, by the clamps C.

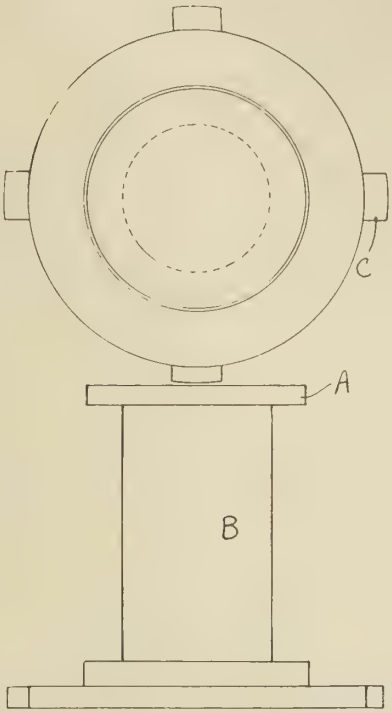

Fig. 7.—Jig for Turning Brasses.

A lathe tool shown in Fig. 8 is used to turn the brass. As may be seen from the illustration the tool holder may be used on other work, it being clamped in place by two screws. The tool may be clamped in any position to suit the work to be done.

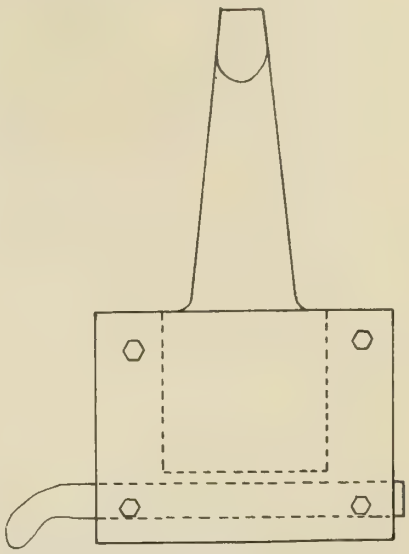

Fig. 8.—Tool for Turning Brasses.

The outside of the brass is finished on this jig. The inside is bored after the brass is pressed into the axle box.

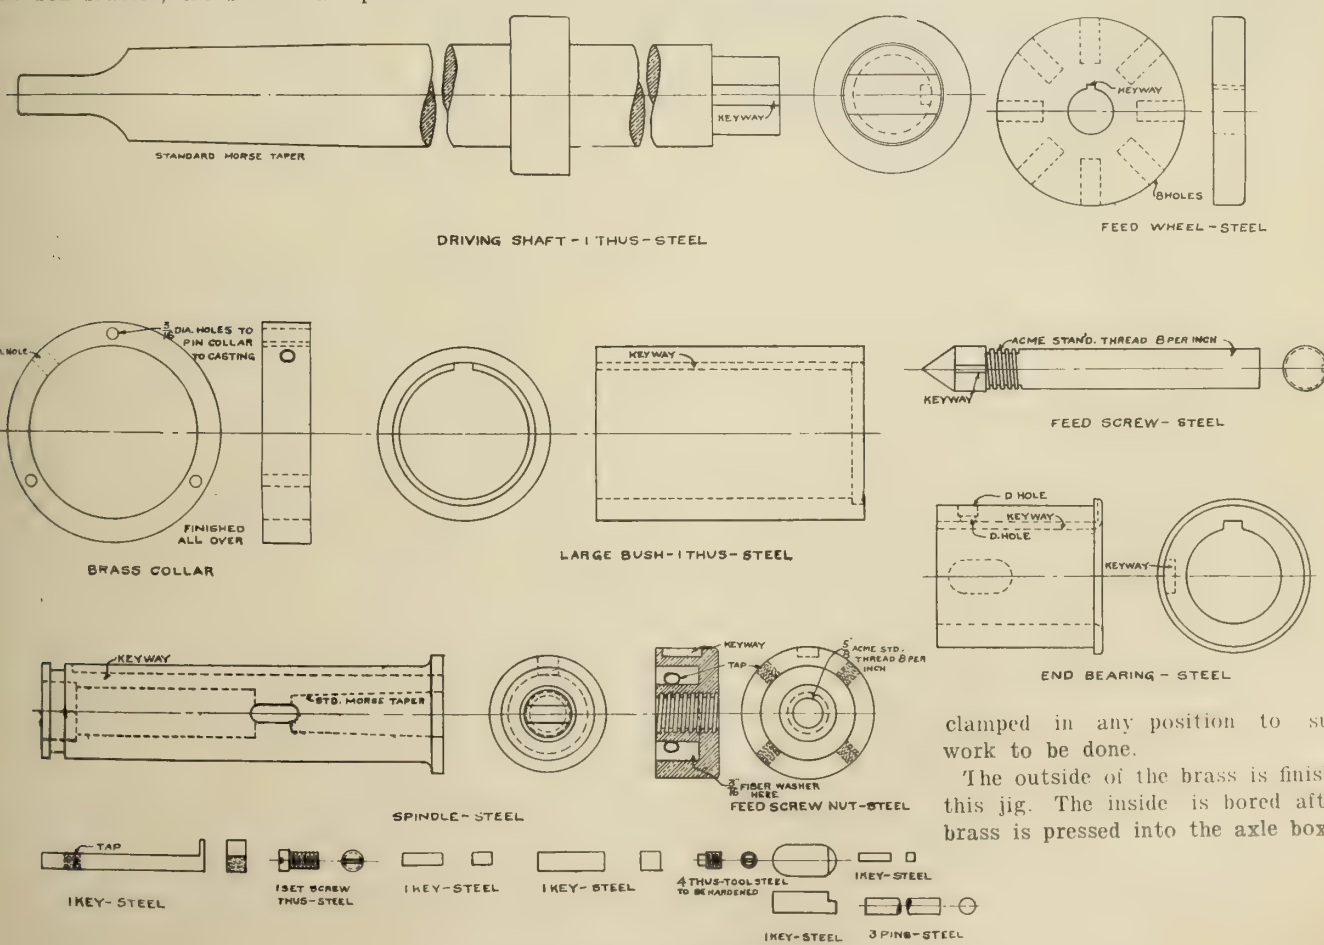

Fig. 6.—Details of Angle Drilling Machine.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

NEW SAFTY CUTTER HEAD.

Any improvement in a machine which will increase the safety of the operator is surely of value, providing, of course, that the efficiency of the machine is not lessened by the change. In a wood working shop, the hand planer is probably the most dangerous of any machine tool, and the statement has been made that more fingers have been lost in hand planers than by any other single type of tool.

A new cutter head for hand planers and joiners, which assures maximum safety to the operator by reason of its permitting the tables to be set very close together, has lately been introduced in the woodworking machine tools manufactured by the J. A. Fay & Egan Co., 362-382 W. Front St., Cincinnati, Ohio. In the old style cutter head with the square block and knives bolted to its sides; the square shape of the block would neither permit the tables to be set close together nor did the head itself fill the opening between the tables. Thus with the slightest slip on the part of the operator his fingers might be drawn in between the tables and badly mutilated if not lost.

Fay & Egan's New Safety Circular Cutter Head.

The new safety circular cutter head closely fills the opening between the tables so that the most severe accident that could possibly happen would be the scraping of a finger or thumb. The design is such that the cutting edges of the knives protrude but slightly from the circumference of the cylindrical-shaped head and thus permit the tables to be set very close to the cutter.

The illustration herewith shows this new circular cutter-head in the manufacturer's No. 61 C hand planer and joiner with the tables drawn back, giving the reader an idea of its construction.

BRYANT CHUCKING GRINDER.

Recently, there was placed on the market a grinder which accomplishes all the operations on work by grinding wheels instead of cutting tools. To this new type have been applied the principle underlying the design of the turret lathe with its semi-automatic features. Work is finished from the rough or from surfaces previously obtained in turret lathes and afterwards hardened. The machine shown in Fig. 1 will grind either outside or inside diameters, together with the faces of both internal and external shoulders. Its scope includes cylindrical and conical shapes and it has a capacity of 12-in.d.x12-in. long.

There are three grinding spindles. The standard equipment comprises 10-in. wheels on the front spindle for outside work; 6-in. wheels on the rear spindle for either outside or inside work or face grinding, and 2½-in. wheels on the middle spindle for internal grinding. These sizes may be varied to meet requirements, but the design regularly furnished gives to each spindle the speed required for the diameters of the wheel as stated. An auxiliary fourth spindle, not shown, is furnished as a fixture to carry still smaller wheels for internal work, being designed to enter a ¾-in. hole if desired. It may also be employed for buffing and for outside grinding. A rigid fixture, clamped to the back of the machine, holds the wheel in front of the central spindle. The wheel is swung into and out of working position without interfering with the use of other wheels.

The three grinding spindles are carried in the head carriage. The turret feature is absent. The spindles are adjustable lengthwise in heavy sleeves, for position, and are locked rigidly while operating. The wheel feed is with the carriage slide only; that is to say, longitudinal. The cross feed is in the head, carrying the work, which is held either in a chuck or spring arbor, on a massive spindle. In other words, the stroke is in the wheel carriage, the feed in the work carrier. A variable speed mechanism actuates the traverse movement of the wheel carriage. The feeding mechanism of the work carriage permits of a wide range of feeds; automatically releases the feed at the desired point, and also provides for automatically reducing the amount of feed as the work approaches completion, the point of release and the degree of reduction being determined by cam forms. A gear box gives nine changes of speed for the work spindle. Both traverse of the wheel spindle head and feed of the work carriage are arranged to reverse.

The machine is driven from one constant speed pulley, which greatly simplifies the overhead works. This drive is transmitted to the wheel spindles by two belts only, and the arrangement is such that only one spindle is revolving at a time, or all are idle. The wheels are so grouped with reference to the work that each holds a natural position for the operation it is intended to perform, which reduces to a minimum the amount of adjusting in changing from one operation to another.

The operation of each grinding wheel is independent of the others, not only in that it revolves alone, but in its individual lever for adjustment to the work and in its knock off and reversing dog in the carriage. In the work carriage there is a cam and stop pin to govern the feed for each spindle. In fact, the control is equal to that of modern turret lathe practice, in securing facility and accuracy in the manufacture of duplicate parts. An auxiliary or length

slide for the work carriage assists in the convenience of manipulation.

The whole machine is a complete new design, but probably the reader will be more interested in the work the machine will accomplish. Fig. 2 shows a cast iron gear with a conical clutch surface. This has to be ground, as shown, in the bore, the clutch surface, and on one face and outside diameter. In the first operation the work is held by tooth-shaped jaws which hold it concentric with the position (which finishes this piece) the work is held by its finished clutch surface on a taper arbor mounted in the work spindle. This arbor may be ground in place to insure absolute accuracy.

Fig. 3 shows the grinding of a tempered collet, which is done at one operation, although four grinding-wheel positions are necessary. The first of these shows the collar held on a taper draw chuck and the internal-grinding wheel at work sizing out the nose. In the second position the small internal wheel is doing external grinding on the

pitch line. Here the bore is ground with a supplementary internal attachment, as shown, provided for work having small holes. (This supplementary spindle may also be used for buffing and polishing with rouge and a soft wheel.) In the second wheel position the work spindle and the bracket on which it is mounted are swiveled to the angle of the conical surface 15 degrees, as shown, which is finished with the regular internal wheel. For the second operation and third wheel position the front face is being ground by the large outside wheel and also being buffed by the wheel on the rear spindle.

In the third position, the large wheel is grinding the outside and the back face, while in the fourth position the work spindle has been swung to the necessary angle, 15 degrees, and the outside wheel is grinding the tapered front seat. It will be noticed that the whole work head is swung for angular work small diameter, while in the third position the work has been swung so that the wheel on the front spindle is finishing the taper portion. It is then necessary to reverse the piece and a small cut wheel on the internal spindle is at work inside the gear.

The machine is the design of W. L. Bryant, and is being placed on the market by the Bryant Chucking Grinder Co., Springfield, Vt.

BENN CLUTCH.

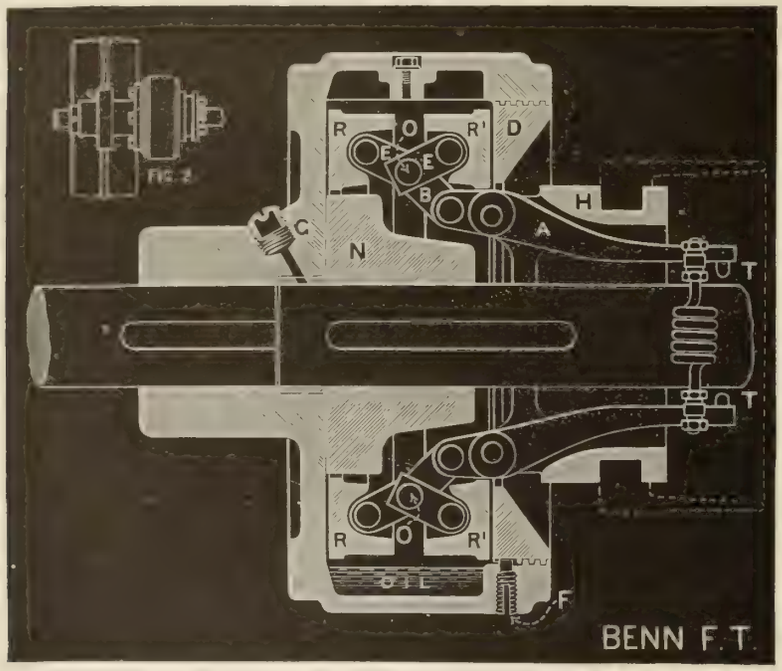
The Benn clutch which is being placed on the Canadian market contains several interesting features. The driving piece N keyed to the shaft is provided with arms and driving pins (not shown in illustration) which carry the friction rings R R round, while allowing them longitudinal movement parallel to the shaft. The toggles E E move the friction rings into or out of contact with the shell G D, and are themselves brought into their most advantageous position (nearly straight) for transmitting pressure by the forward movement of sleeve H with its levers A A and links B B.

The requisite friction for driving is obtained by the tension of the spiral springs joining the long ends of levers A A, which springs open slightly as the links B approach the vertical, and when they pass the vertical, lock them and the toggles and friction rings in gear. Adjustment for toggle position and for wear of parts is obtained by screw ring D, the exact position of the toggles and internal rings being ascertainable at any time from the outside by the clearance between shaft and pointers T T.

As shown in the illustration, a good bearing must be provided close up on each side, and the two shafts must be in-line. If these two conditions are given, the clutch is guaranteed.

When used to carry rope or belt pulley, the clutch is arranged as in Fig. 2 shown at the left of the large illustration. The pulley, which is bushed with gun-metal and provided with spring lubricator for solid oil, is bolted on to the clutch shell. If it has to be out of gear for long periods the pulley and clutch shell should be carried on a sleeve clear of the shaft, and supported by independent bearings, so that friction and wear on the shaft is avoided.

These clutches are manufactured by the Unbreakable Pulley & Mill Gearing Co., London, and are being placed on the Canadian market by Vandeleur & Nichols, Dineen Building, Toronto.



The Benn Clutch, Shown Out of Gear.

ONE ROAD TO THE TOP.

It is one of the paradoxes of life that the fellow who does his work faithfully without being watched by the boss, comes to be the very person whom the boss most watches.

But this sort of worker is watched not to make sure of his fealty but to determine the extreme of his capabilities so that the institution of which he is a part may take advantage of unusual fidelity by putting its exponent into the place where that faithfulness may be of greatest value.

The man or woman, the boy or girl, who will work without being watched, is so unusual that the appearance of one in any business institution is almost startling.

At the start, the reports of his immediate superior testifying to so amazing a phenomenon are received by those higher up with unconcealed incredulity.

"It will wear off," they say, for in their experience it nearly always has worn off.

"He's a new man and uncertain of his job," say others, "but pretty soon he will fall into the rut and do as all the others do."

But if he doesn't; if on the other hand he works on just the same when the boss is elsewhere as when he is watching, the conviction slowly steals over those in authority that they have accidentally picked a winner.

From then on the worker is watched. He is tested. His faithfulness being a certainty, the question of his intelligence and capacity must be determined.

Around him are doubtless others more quick-witted, more brilliant. Judged by their capabilities these others may be one hundred per cent. men, though only fifty per cent. men in performance.

But the men who are wise enough to be in charge of the larger affairs of business know that a faithful man who is always on the job achieves more and is of more value than the apparent one hundred per cent. man whose person or whose brain is away at the baseball game.

Thus little by little more important tasks are assigned to the faithful employe. Though he may be the latest comer he is the soonest promoted.

And the others—well, they sit back and berate the boss. They always knew that the faithful one had a pull or that the boss has it in for them.

They cannot see and they cannot understand the simple reason why the man who works when the boss isn't looking, gets ahead. If they could see or understand some of them would follow the faithful one's example.

And some of the others will tell the faithful one that he is "trying to get a stand in" with the boss. To their infantile minds it seems the highest stretch of foolishness to try and stand in with the men who determine your wages and your tenure.

But the faithful one if he has sense as well as honesty will not swerve. As long as he sticks to the fundamental honesty of giving a full day's service for a full day's pay even if there be a chance to soldier and renage, he travels the road that leads to the top and no man can stop him.—Silent Partner.

The standardization of parts reduces the number of jigs and tackle used in manufacture, and increases the production by expertness due to frequency of handling. Thus the cost per piece is lessened, and the possibilities of quicker deliveries give a more rapid turnover of capital. Not the least point in the favor of standardization is the influence of such activity on the men in the shop. During slack periods standard parts may with advantage be built for stock, and thus help to meet the call of urgent orders.—Mechanical World.

Oxy-Acetylene Welding Makes the Scrap Pile Less

Some Castings That can be Ecomically Repaired, Thus Saving them from the Scrap Pile.—A Description of the Linde System.

A Linde Oxy-Acetylene instalation has been made at Charles Potter's, 85 Yonge St., Toronto, where repairs are being made to gas engines, patterns, etc, showing the great saving that may be made by using Oxy-Acetylene system of welding. The instalation was made by the Linde Air Products Co., Buffalo, N.Y. The Canadian company is in Montreal.

Complete systems are designed and installed, the one at Charles Potter's including a full range of pipes, from No. 1 to No. 15. A portable attachment allows the torches to be used on any work that cannot be brought into the shop. As an illustration of what may be done, the frame of a Ford car was broken, the welding apparatus was taken to the

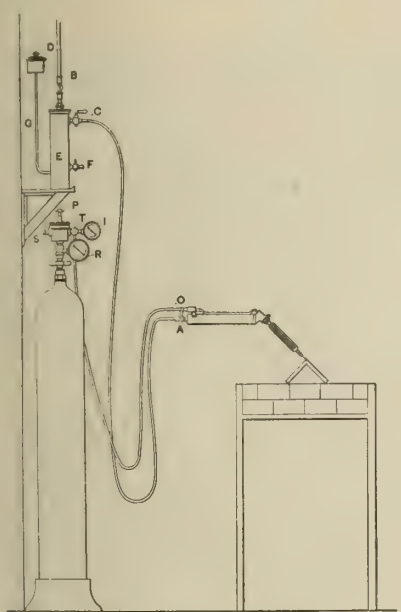


Fig. 1.—Linde Oxy-Acetylene Welding Outfit.

car and the frame repaired without dismantling the car.

The Oxy-Acetylene blowpipe (Fouche's patent), is a low pressure blowpipe, constructed on the injector principle and is designed and proportioned to meet all the special conditions with which an Oxy-Acetylene blowpipe must comply. It is so constructed that the flame cannot strike back. The gases are well mixed in the injector chamber before they issue from the nozzle of the blowpipe, and the nozzle itself is so constructed that the possibility of carbonaceous deposit in the orifice is practically obviated. It is made in ten sizes.

Fig. 1 represents diagramatically a complete Linde Oxy-Acetylene blowpipe installation with the exception of the acetylene generator and holder which may be placed in any suitable position and at any convenient distance from the blowpipe apparatus.

In the Fig. 1, B is a cock connecting the inlet nipple of the hydraulic back-pressure valve with the acetylene supply pipe from the acetylene holder. The blowpipe is connected at A by means of an ordinary stout rubber tube with the outlet cock C of the hydraulic back-

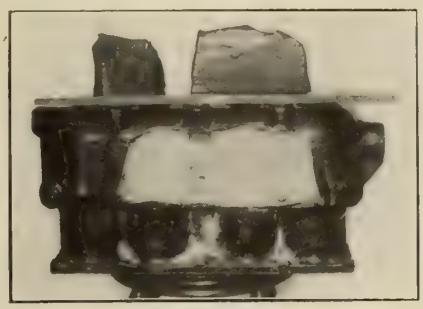

Fig. 2.—Broken Taxi-Cab Cylinder.

pressure valve which forms the acetylene supply pipe of the blowpipe.

The blowpipe is connected at O by means of a stout rubber tube with the outlet cock T of the oxygen pressure regulator, which is attached, as shown, to the valve on the oxygen cylinder. This pipe conveys the oxygen supply to the blowpipe, and should be securely attached, as it is subject to pressures varying from 10 pounds to 30 pounds per square inch.

Repairing Castings.

Fig 2 shows a broken cylinder of a 4-cylinder Toronto taxi-cab which was repaired at Charles Potter's. The repaired

Fig. 3.—Repaired Cylinder.

cylinders are shown in Fig. 3. The water jacket was broken out, the broken pieces resting on the top of Fig. 2. The cylinder was pre-heated so that no strains would be set up afterwards.

Tool holders, patterns, etc., from $3 up can usually be repaired economically. Other things that can be repaired are printing presses, crankshafts, automobile parts, pulleys, gears, valves, etc. The repair is made at a much less cost than making a new part. The repair seldom costs over one-third of the first cost of the casting and usually much less. On small castings the percentage is much larger than on larger ones. On small repairs to large cylinders, automobile frames, etc, the percentage is very low.

UNIQUE CAR BARN HEATING SYSTEM.

The new system of heating installed in the car barn of the Toronto and York Radial Railway, at St. Clair Ave., Toronto, Canada, is unique. In place of a steam boiler, which in ordinary car barns provides steam for heating, but seldom for power, there will be a heater for transferring the heat in the coal direct to the air, and a fan will force this heated air through the distributing system. The heater, which resembles a sectional water-tube boiler, is called an "air-tube" heater. It is the unique feature of this system which is being installed by the Harrison Engineering Co., of New York City. This new method of heating will be watched with interest, for there are no steam pipes or coils to be drained, no boiler to burst, and no accessories to be emptied or blown down in order to prevent freezing, should it be necessary to shut down the plant during the winter.

CENTRAL RAILWAY CLUB.

The regular meeting of the Central Railway and Engineering Club was held in the Prince George Hotel, Toronto, on Feb. 15 when a paper was read on "The Principle of Melting Iron in the Cupola," by E. B. Gilmour, superintendent of the molding department at the Canada Foundry, Toronto. This paper is reproduced in the Foundry Department of Canadian Machinery. M. J. Duguid, president, occupied the chair. Many members took part in the discussion of the paper.

A social evening was tendered to members and prospective members at the St. Charles Hotel on Feb. 25.

A. F. Well, B.A.Sc., and J. V. Gray, formerly of the Bishop Construction Co., are carrying on a general engineering and contracting business under the name "Wells & Gray, Ltd.," at 315 Confederation Life Building, Toronto.

George Y. Chown, B.A., has resigned his position as Registrar of Queen's University and secretary of the School of Mining to devote his time to managing the affairs of the Wormwith Piano Works, of which he is now sole owner. Mr. Chown will retain the position of treasurer of Queen's.

Equipping Each Machine With Its Own Power Plant

How Manufacturers have Applied Electric Motors to Drive Machinery—Some Interesting Instalations of Individual Motor Drive

Illustrated herewith are a number of machines equipped with motor drive Fig. 1 shows a Toledo open-back, inclinable, plain press for making handles,

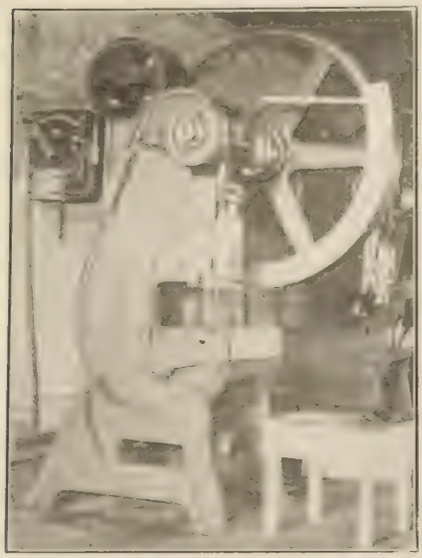

Fig. 1.—Motor Driven Press.

lock parts and sheet metal work made by the Toledo Machine Co., Toledo, Ohio. It has its own power plant. In other words it is motor driven. The motor is 2½ h.p., 250 volt Westinghouse, type "S" direct current shunt motor which runs 1025 r.p.m. Line switch and starting rheostat are shown mounted directly on the machine frame. The large spur-gear reduction, meshing with

Fig. 3.—Motor Connected to Vertical Shaft.

the motor pinion, transmits directly to the crank shaft which carries the pitman connecting to the cross-head punch motion.

Advantages:

One of the advantages of motor drive is in getting power around corners. When certain machines are in use, it is not necessary to run the whole line shafting. That is a second advantage. Any machine that is idle a great part of the day should be driven by individual motor. When a number of machines are to run practically all the time it is often economical to run them all by one motor.

Another advantage in motor drive is the placing of the motors. It may be located on the floor, on the ceiling or on the machine depending on the work to be done.

Fig. 2 shows a motor mounted on a platform suspended from the ceiling direct connected to a blower. The motor is a Westinghouse 30 h.p. squirrel cage 60 cycle, three phase, 220 volts.

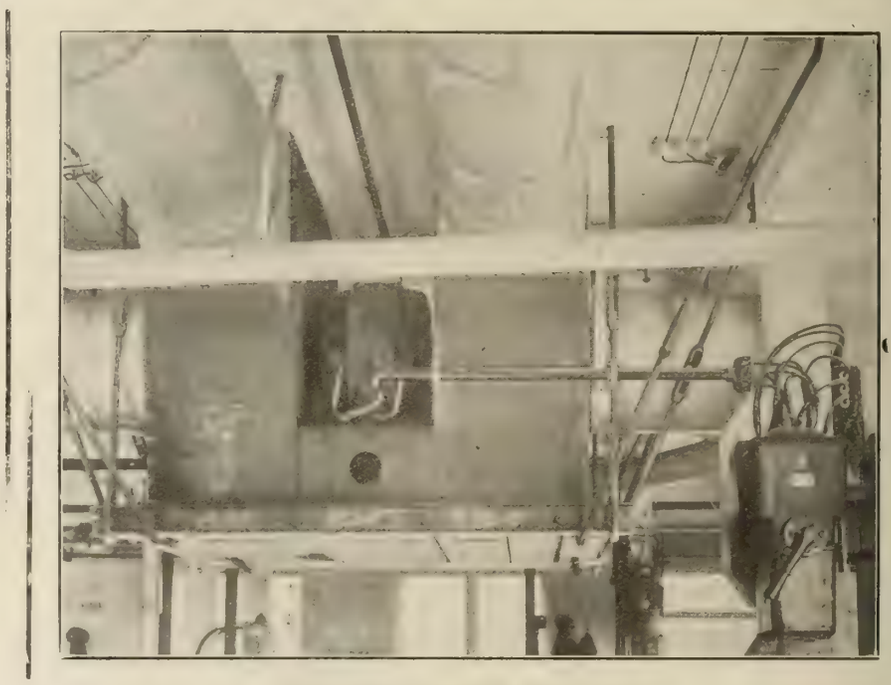

Fig. 2. Motor Arranged to Drive Blower.

The blower is a 30 inch, collecting the shavings from the other machinery and forcing it across a roadway.

Fig. 3 shows a Westinghouse motor connected to a vertical shaft driving a post sander. The motor is a 2 h.p. 220 volts, started from a three pole, double throw switch, wired without fuses for starting but with fuses on the running side.

On the starting box in Fig. 2 is printed the words "Stop Motor." This is a constant suggestion to the operator that the realization of the advantage of intermittent operation are up to him.

WESTINGHOUSE 1910 DIARY.

The Westinghouse Diary for 1910 has some additions over those issued during the past six years. It contains much condensed material of instructive type and pertaining mainly to electrical questions. Not the least interesting of the contents is the brief but impressive presentation of Westinghouse plants. Among the reminders of an especially ingenious character are the wrinkles introduced with the wire table. A wire which is three sizes larger is shown to be twice the weight, twice the area, but only half the resistance. Of course, this ratio applies to the other sizes. One thousand feet of No. 5 wire weighs 100 pounds and No. 10 wire is almost eactly 0.10 inch diameter. These and many other pointers of more or less consequence to those using or contemplating the purchase of electrical apparatus are given space in this neat leather-covered handbook of information.

OIL FOR WINTER USE.

It is often difficult to keep machinery properly oiled in cold weather, as the oil freezes in the oil holes and the cups, and the oil upon the ways of the lathe and planer becomes stiff, causing the machines to work hard. A good oil for winter use is made by mixing graphite with cylinder oil until in a thick or pasty consistency, and then adding kerosene until it flows freely. This oil will not become stiff at 14 degrees below zero, and is valuable to those operating machinery outside or in cold shops.

Correspondence

One of the suggestions given in reply to our editorial in the February issue asking for comments, was that a question and answer department be established. This will appear under the heading of correspondence and will be entirely separate from the "Methods and Devices Department." Anyone desiring names of firms and addresses will be answered through this department. Comments on answers and previous articles containing good ideas will be paid for.—Editor.

British Trade.

A writer from London wishes to be put in communication with a large Canadian firm wishing to open stores in London, England. The writer has been selling United States machinery for twelve years. His address will be given by writing Canadian Machinery.

Draftsmen.

I have passed the examinations of the I. C. S. in mathematics, mechanics, strength of materials, steam engine design, geometrical and mechanical drawing. (1) Do you think I could hold a position of draftsman. (2) What pay does a draftsman get?

We think you should, if you have been observant in your present position, be able to take up the work of drafting, but of course, you would have to work at small pay until you had proved yourself able to take care of more responsible work. There is practically no limit to the possibilities of a good draftsman, though in starting the salary will probably be from about $2 per day up.

Tempering Gears.

We would like a safe, simple method for hardening the teeth of steel cut gears after they have been dressed so that warping will be eliminated.

We would suggest that two large washers be used, bolting the gear firmly between them when hardening. This will keep the centre of the gear soft and assist in preventing warping. We would also suggest that the gears be re-tempered just before finishing.

Heat the gears in a muffle, if possible, thus preventing the gears coming in contact with the fire. Heat the gears from 1,500 to 1,550 degs., but not higher. In hardening, the gear may be put on an arbor, letting the arbor rest on the side of the box. The gear can then be turned around in the solution, having only enough solution in the box to wet the teeth. Small wheels are usually case-hardened by cyanide of potassium. Readers having had experience in case-hardening gears are requested to send in the results of their experience.

Factories Act.

Will you permit me to use some of the valuable space in your paper to make a protest in reference to an amendment that is being made in the Factories Act that any employe injured can start a suit for damages in six months.

While quite in favor of any amendments that make for the safety of employes, yet here is the danger in this amendment, the easier it is for employes to get damages the more careless they become, especially when there are a lot of lawyers who are looking for every little excuse to work up a case for damages. Most employers know that nine times out of ten that injury is caused by carelessness; this should not be encouraged.

A good strong protest on the part of manufacturers would mean that the law would be fixed so that the responsibility would be placed on the right parties, not a case of hold up.

MANUFACTURER.

RE-LIGHTING CUPOLA FIRE.

It isn't often that a cupola fire goes out, but accidents will happen. It was probably the first time in the history of the Canada Foundry Co., Toronto, when their cupola fire went out recently. It certainly was the first in the long experience of E. B. Gilmour, superintendent of the molding department.

It may be interesting to know how the fire was re-lighted. The cupola was filled to the charging door with tons of coke and iron, and a look through the tuyeres showed that every bit of wood had been consumed and the cupola could not be dumped, as there was a large floor of molds ready for the charge to melt.

A steel bar was procured, and the breastwork was knocked out. A generous piece of waste was soaked in oil and pushed underneath the charge. Then with a gas torch and compressed air a flame was kept playing on the waste and coke bed until the fire was started, when the blast was turned on and the melt proceeded with in the regular way.

FIRE-CLAY AGENCY.

Alex. Gibb, 13 St. John St., Montreal has been appointed sole agent for Canada of the Glenboig Union Fire-Clay Co., whose head office is at West Regent Street, Glasgow.

The fire bricks and ground fire clay of this company are well known in Canada, and under the control of Mr. Gibb a vigorous selling campaign is to be instituted. The success of the Glenboig products is due to the quality of the clay found at Glenboig, Lanarkshire, and the advanced methods, combining care and knowledge, employed in the manufacture. The products of the company have been successfully shown at all the principal exhibitions, and in every case have secured the highest awards, the medals and diplomas numbering 48. About a thousand hands are engaged in mining the fire-clay and in the processes of converting the raw material into all kinds of fire-clay goods, showing the extensiveness of the operations of the company and the demand for their goods from all quarters of the globe.

PERSONAL

F. Horace Disston, lately of Philadelphia, has been appointed superintendent of Henry Disston & Sons' new saw works at Toronto.

J. Hossack, Toronto, sales manager of the Lufkin Rule Co., is visiting the Maritime Provinces and Newfoundland, on a business trip.

F. B. Cowan, manager of the Gananoque Bolt Works, which has been taken into the Canada Bolt Co. merger, will be manager of the two Gananoque branches of the merged company.

W. F. Beardshaw, of J. Beardshaw & Sons, Baltic Steel Works, Sheffield, Eng., is in Montreal, on a visit to Alex. Gibb, the sole Canadian agent of this firm. Mr. Beardshaw will visit several other Canadian cities while in Canada.

Fred Harding, who has been secretary-treasurer of the London Machine Tool Co., Hamilton, since it started was presented with a valuable gold watch by his fellow directors. Mr. Harding is leaving the company to go to Toronto, where he has accepted a position with the Chapman Double Ball Bearing Co.

H. C. Hunt, who has been managing director of Brass & Steel Goods, Ltd., Belleville, since its organization has transferred his interests to W. C. Springer, who will take the full management and direction of the company. It is stated that the Corbin Lock Co. is to take over the Brass & Steel Goods Company's business and the plant is to be enlarged considerably.

According to the Geological Survey, the United States leads all other countries in the conversion of raw asbestos into manufactured products, although much less than 1 per cent. of the material used is mined in that country.

Vol. VI. March, 1910 No. 3

LET THE BUSINESS MEN KNOW.

There are bills which come up from time to time in the Dominion Parliament and in the various provincial parliaments which need the expert attention of the business men of the country. Yet these men never see or hear of these bills until they come before the house and then only through meagre newspaper reports.

How simple it would be for the governments to have a list of the boards of trade in Canada and in the respective provinces on file and each time a bill is drawn up to send a copy to each.

Boards of trade are composed of the best business men in the country; they are therefore the most competent men to judge whether a bill is in the best interests of trade or not; they are in a position to suggest changes, omissions, or additions which often make a bill really effective.

A good example of this is to be found in the Secret Commissions Act. If that bill had not fallen into the hands of a business man who understood what it was intended to do, we never would have had the last clause which makes the party knowingly privy to any offence of the act liable to the same penalties as the giver of the secret rebate.

The boards of trade which represent the manufacturing and all business interests of a community should therefore be in touch with the government and should be made acquainted with what is going on in parliament.

A copy of each bill respecting business should be sent to the president or secretary of each board of trade just as soon as it is in type in order to give the business men an opportunity of studying it and offering their opinions.

BE PROGRESSIVE.

The man who "never did things like that" is gradually weeding himself from the list of successful men in their business and profession. When confronted with the problems of the present and having suggested to him certain courses to pursue, he puts up the plea that he has never done things that way, has heretofore been successful and sees no reason why he should modify, change, or add to that which has made him where he is. He keeps on for a while in the way he is going, and although he insists that he is doing good work, he knows that something is wrong, somewhere, but he still sees no reason for adopting newfangled ideas.

If we can't make up our minds to do the things of to-day as the necessities of the day demands and shape our methods according to the particular requirements of the present, we'll sooner or later find that he who has a way of his own of doing things, and persists in doing things that way under any conditions, will get left far behind in life's race.

A man goes to bed with a clear conscience that he has fixed his business properly for the problems he has contended with during the day, but he wakes up to his business the next morning with some new series or sets of trouble confronting him that demand other treatments.

Ignoring or passing over won't rid his business of the annoyances, and because he didn't have them to contend with 10 or 20 years ago, he fools himself expensively if he attempts to let them go unnoticed and unconquered.

It doesn't make an difference how we did things some other day; the problems of to-day are the ones that demand our attention to-day, and if we don't know how to handle them, it is up to us to find out immediately.

MODERNIZING OLD SHOPS.

The advent of high-speed steels has made many machines in the shop out-of-date. Some foremen, superintendents and manufacturers have found it inconvenient

to make use of the new steel on account of the machines not being able to stand up to their work. Some superintendents have found it advisable to replace the less modern machinery by those of heavier design, and in some cases by motor-driven machines, the older machines being then consigned to the scrap pile. When the efficiency of the shop can be increased to an amount to pay at least the interest on the investment, this is a paying proposition.

In other shops the first cost has been a difficulty in the way and the old machines have been worked to their capacity, which in some cases is very low compared with 1910 practice. Others again by the adoption of several schemes have brought the machinery up-to-date.

Where lathes have four-step cones, they were made into two, the first and third steps being raised to the level of the second and fourth. A belt of twice the width is then used, giving power sufficient to greatly increase the output of the lathe and to obtain the benefit derivable from using high-speed steel. Other machines, including shapers, etc., have been similarly treated.

Increased outputs are obtained with planers by using individual motor drive, connecting them to the planer-driving gear by chain drive or increasing the width of the belt so that high-speed steel may be used.

With the increased speed of the machinery in bringing it up to modern requirements, attention has been given to lubrication. The drilled hole in the bearing is replaced by an oil cup, which keeps the fast-running parts well lubricated.

It has been found in modernizing the machine shop by introducing modern tools and bringing older ones up-to-date, that the capacity of a given number of tools is greatly increased and costs of output have decreased. The modern machine tool, coupled with good management, is a great factor in present-day competition, and the shop that is up-to-date, is the one that produces at a minimum cost.

CANADA'S FOREIGN TRADE RELATIONS.

The surtax of one-third maximum duty on imports from Germany has been abolished, the new agreement taking effect, March 1. We have pointed out on several occasions that various German organizations were interested in promoting better trade relations between Germany and Canada, and the present arrangement between the two governments is the result.

The French Treaty is now in force, as intimated in the February issue of Canadian Machinery. Among the French goods provided for in the treaty are:

316. Electric light carbons and points, 32½ per cent.

339. Mfgs. of lead, 27½ per cent.

352. Brass and copper nails, tacks, rivets and burrs or washers; bells and gongs, n.o.p.; and manufactures of brass or coppoer, n.o.p., 27½ per cent.

354. Manufacturers of aluminum, n.o.p., 22½ per cent.

418. Wire cloth, or woven wire of brass or copper 22½ per cent.

438. Locomotives and motor cars, for railways and tramways; and automobiles and motor vehicles of all kinds, 30 per cent.

Ex 453. Telephone and telegraph instruments, electric and galvanic batteries, electric motors, dynamos, generators, sockets, insulators of all kinds; electric apparatus, n.o.p.; and iron and steel castings, and iron and steel integral parts of all machinery above specified, 25 per cent.

454. Manufactures, articles of wares of iron or steel or of which iron and steel (or either) are the component materials of chief value, n.o.p., 27½ per cent.

The following Canadian products are included among those provided for in the treaty:—

205. Cast iron.

206. Wrought iron crude, in blooms, prisms or bars.

207. Iron, drawn in bars, angle and T iron, axles and tires, in the rough.

210. Sheet and plate iron.

212. Iron or steel wire, whether tinned, coppered, zincked, galvanized or not.

212. Rails of iron or steel.

213. Steel in bars.

214. Axles and tires rough, in steel.

216. Steel.

221. Copper.

222. Lead.

225. Nickel.

227. Antimony.

488. Transmission belts, etc., of leather.

522. Agricultural machinery.

554. Iron castings.

567. Tubes of iron or steel, not welded.

620. Manufacturers of India-rubber and gutta-percha.

In the seven months ending January 31, 1910, United States imported into Canada, goods valued at $116,130,775. It is to be hoped that the Tariff Commission of the United States will make satisfactory arrangements for the continuance of the growing exchange of products between the United States and Canada.

Canadian trade in January amounted to $51,500,102, of which total the increase is $12,322,627. Imports and exports are in the proportion of about three to two, which is a gain of thirty per cent. over the first month of 1909, when the commercial recovery had barely begun. One of the most encouraging features of the ten months' statement is an increase of two millions in manufactured articles exported. For the ten months imports have totalled $302,050,207, an increase of $60,978,445.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

PRINCIPLES OF MELTING IRON.

By E. B. Gilmour *

The subject which I have chosen is "The Principles of Melting Iron in the Cupola." The name and style of this furnace is derived from a cupola or dome leading to the chimney, which is now frequently omitted.

Cupolas are made in sizes ranging from 18" to an unlimited size in diameter, to suit the requirements of the foundryman, and in nearly every foundry there are two or more cupolas, a small one for every day use, and a large one for specially large heats. The shape and style of cupolas have become more or less standardized with very little difference as regards results, unless when some one in authority is putting in a new plant, and wants one of his own design, and at the same time, if he was put upon his own resources he could not melt iron even in his own cupola. All founders possess more or less knowledge of cupola practice, and mixing of irons. When I say founders I do not mean molders, as plenty of molders do not know know anything about the cupola.

The cupola furnace for melting iron has a great advantage over all kinds of furnaces, as it melts iron cheaply and quickly, from a small quantity to an unlimited amount, with very little fuel. The cupola does not improve the quality of the iron melted, but in this age of keen competition, every one is trying to get the best results as regards quality and quantity in their product. The improvements that have been worked on the cupola have been very little, comparatively, with the other improvements that have been added to the foundry. I remember the old style of cupola with the single tuyere on each side, blowing direct into the furnace which gave good results. Now they are built in multiple rows of tuyeres, which is a great improvement.

Cupola Practice.

In good cupola practice there is a loss of heat units to the extent of about 25 per cent., and in order to have perfect combustion, you must supply a sufficient amount of oxygen to the amount of carbon in your cupola, as when a substance containing carbon burns in an insufficient supply of air, oxidation of the carbon is not complete and the product, instead of being carbon-dioxide, is carbon-monoxide, consequently there will be a great loss of fuel, in not using all the heat units capable of being produced, according to the amount of fuel supplied, but if you add at different stages in your cupola more oxygen, it will combine with the carbon-monoxide and produce carbon-dioxide, and in this stage you have as near perfect combustion as it is practical to get, from a cupola.

Too much blast is attended with an increased consumption of fuel per ton of iron melted, which also chills the furnace and causes it to scaffold. On the other hand, too little blast is attended with a loss of heat.

It is not my object, to advertise any particular kind of cupola or condemn any one that is on the market for sale, but to try and outline some of the principles involved in melting iron in the cupola.

After a very careful study, extending over a number of years, both from a chemical and practical standpoint, I designed a cupola with upper tuyeres. I never had the opportunity to erect a cupola as desired, but some years later I was employed with the E. P. Ellis Co., Milwaukee, Wis., who had a cupola of practically the same design which was giving most remarkable records; this was a Whiting cupola of nine tons capacity per hour. Previous to the changes having been put upon it which afterwards gave fifteen tons per hour and giving very hot iron for the finest of machinery castings, with a consumption of fuel of ten to one, this ratio could be easily increased, but in order to get good hot and clean iron you must use fuel, and this is a very exceptional result. We often see in trades journals records of far more phenomenal results than this, but I am sorry to say that they are only upon paper, or if they are in the foundry, you have a proportional large scrap heap caused by dull iron.

Getting Iron Hot.

One great secret in foundry practice is to get the iron hot, which means clean iron. The fact of trying to save a little coke in the cupola is all a fallacy because the price of coke is not of so much consideration, when in ordinary practice you get eight pounds of iron melted for one pound of coke. The principal thing is to get quick melting so that you can get more hours molding. As a rule when iron begins to flow the molder gets ready to pour, so consequently the longer your heats, the less production.

Description.

For the benefit of those who are not familiar with the cupola I will begin at the foundation and explain how iron is melted. The cupola is practically a cylinder made of boiler plate with holes at regular intervals divided around the shell averaging about two feet from the bottom. This shell is set up on four legs attached to a cast iron frame with two half circled doors with hinges. These doors are held up with a rod or pin from the ground. The inside of this shell is lined with fire brick all the way up to the top in order to preserve the shell. These holes around the shell are called tuyeres, which are connected to each other by a continuous belt around the outside, and it is this tuyere arrangement that gives effective or non-effective melting, as the case may be. On top of the bottom doors there is about four inches of sand gradually tapered towards the tap hole. A fire of wood is started on top of this sand and filled up with coke, up to twenty-four inches above the top of the tuyeres. Between this point and the tuyeres is called the melting zone; this is where all the melting is done. On top of this coke bed an amount of iron is put on, to about 3½ pounds to one of coke in the bed, thereafter another layer of coke and iron alternately, of one to ten, and this is continued until all is charged that is required for that day. On top of each charge of iron is placed about 30 to 40 pounds of lime stone, this makes the slag from the iron and coke very fluid, so that in large heats it is run off, so as to keep the cupola clean.

About two years ago, when the foundrymen were in convention in Toronto, there was a new cupola put upon the market with phenomenal records of melting. It embodied the same principle as I was working in my cupola, but with this difference, that he drew all the gases from the cupola as they escaped over the top of the highest charge with another row of tuyeres at this level. As a consequence he draws the carbon-dioxide gas which is, roughly speaking, the ash of the gases, generated in consumption. Now this is a gas that you want to get rid of. His system is to get the oyygen from the charging door, also the carbon-monoxide from the cupola, which would be hot, and get rid of the clogging of the tuyeres. This

* Superintendent Molding Department, Canada Foundry Co., Toronto.

system has not proved so good as the designer anticipated, as I watched the records and demonstrations for three days, and noticed a very heavy burning out of the upper tuyeres, and the iron was not hot enough for the usual run of light castings. I believed that the saving of fuel was at the expense of the iron.

Melting Irregularities.

In general cupola practice there are a number of irregularities in melting which caused Mr. Hart to make an inquiry as to the cause. This is also in the blast furnace; he says:—"He describes some of the irregularities to differences in atmospheric pressure; thus the range of the barometer in Great Britain being about three inches, or rather more than one tenth of the mean pressure, this change of density would produce a difference of one-tenth in the bulk of the air. And, therefore, between a severe frost with the thermometer at 20 deg and sultry weather at 70 degrees, the difference would be 50 degrees, and as atmospheric air dilates or contracts one four hundred and eighty-fifth part of every degree, this difference in temperature would produce a variation of rather more than one-tenth in the mass or bulk of the air. So that, if during severe frost the barometer stood at thirty-one inches, while during sultry weather it stood at twenty-eight inches, the combined effects of the differences in temperature and the pressure would amount to a total variation of one-fifth in the bulk of the blast, which would be nearly equivalent to a careless furnace man putting into his furnace ninety pounds of coal instead of one hundred. During a whole casting, indeed, the difference from temperature and pressure amounts to something like an irregular charging of the furnace with ninety pounds indiscriminately, instead of one hundred pounds regularly."

These observations of Mr. Hart are certainly worthy of attention. The impression of the effect of moisture in the air is still as firmly held as ever. Taking the average of five years, selected at intervals of the same period, for twenty-two years working, the following quantities of coal were consumed for every ton of crude iron produced:—

	Winter Cwt.	Spring Cwt.	Summer Cwt.	Autumn Cwt.
Foundry iron furnace.	49.7	52.2	53.1	55.4
Forge iron furnace...	43.6	44.2	44.6	45.8
Blast furnace iron...	43.2	44.1	50.1	49.5

In the first, or foundry iron furnace, the excess of autumn over winter months is eleven per cent.; in forge furnace equal to five per cent., and in blast furnace fifteen per cent.

Statistics of Canada's Iron and Steel Production

Returns Gathered by Canadian Machinery for 1909 show Material Advances over the Totals for the Previous Year.

Although Canada's iron and steel productions for 1909 may not show such tremendous increases as reported to have happened in the United States, yet the authentic figures—now first published—indicate a marked improvement over those of the previous year. In every line there has been a significant advance, and the gratifying totals which we anticipated at the publishing of our half yearly statement have been more than realised. Taking iron and steel as the best trade barometer that a country can possess, it is evident that Canada had a good year, and starts in the best of shape for making 1910 the best of all.

20 to 30 Per Cent. Gain.

A glance at the appended figures shows that the total pig iron production for last year was 112,648 tons better than for 1908, or nearly 20 per cent., while the ingot production was 164,360 tons, or over 30 per cent. Considering that the improvements taking place in the various plants were, in but few cases, sufficiently advanced to be of any great help, it can be understood that the pressure of all this increased production must have been very great. In fact, for several months the furnaces were not looking for orders, and delivery was hard to obtain. The congestion in steel was likewise severe, especially as two of the great producers were out of the open market, having all they could do to look after their own wants.

Detailed Figures.

Of the detailed figures of the iron production it will be noticed that while they all show advances, Bessemer, with an increase of 47,772 tons, or over 40 per cent., and foundry with an increase of 25,109 tons, or over 30 per cent., are most prominent, that is so far as comparisons with the previous year are concerned.

The steel figures show great and significant increases. Wire rods for instance, show an increase of 31,582 tons, or 76 per cent.; bar steel, iron and structural material, 39,074 tons; rails, 69,969 tons, while plate, axles and sundries, etc., show the greatest comparative increase of any, that of 3,381 tons, or over 100 per cent. Castings also are very prominent, with an increase of 4,610 tons or nearly 50 per cent. It is evident from this that all classes of consumers have been active buyers.

Twelve furnaces were in blast compared with eleven for the previous year.

The Canada Iron Corporation are building an additional furnace at Midland, Ont., which will go into operation in about three months.

The Algoma Steel Co., in addition to the new furnace and mills now in course of construction, are also adding coke ovens to be built this year.

The Deseronto plant of the Standard Chemical Co. will be improved by an ore trestle, and the instalation of an electric motor in the ore dock. Canadian Machinery has already published details of the additions now in course of construction at the Dominion Iron & Steel and the Hamilton Iron & Steel.

The Year's Figures.

	Year ending Dec. 31 1908.	Year ending Dec. 31 1909.
Total iron production..	566,515	679,161
Total ingot steel production	511,569	675,929
Details.		
Pig Iron—		
Basic	315,194	362,917
Bessemer	116,230	164,002
Malleable	18,293	29,500
Foundry	81,932	107,011
Charcoal	4,566	15,671
Steel—		
Ingots	511,569	675,929
Blooms	370,563	472,126
Billets	105,473	139,335
Rails	267,377	337,346
Wire rods	11,120	73,002
Bar steel, iron and structural material..	81,981	121,058
Castings	9,350	13,960
Plate, axles, spikes and sundries	3,110	6,521

The Osborn Mfg. Co., 5401 East Hamilton Ave., Cleveland, have issued catalogue No. 124 describing their adjustable flask stripping molding machine. The machine is made in three sizes and each size can be adjusted to four standard widths of flasks and any length as may be required.

Patterns are mounted on a metal or wood pattern plate. The cast iron flask supports on either side of the machine are adjustable sideways, these adjustments being graduated to ½ inch spaces, and in addition, the surface plates on top of these flask supports are also adjustable sideways to accommodate the machine to any trifling irregularities in flasks of standard sizes.

A full description with illustrations is given in the catalogue. Several other molding machines are also described. The catalogue will be sent on request.

SUGGESTED CHANGE IN CUPOLA PRACTICE.*

By Dr. R. Moldenke, Watchung, N.J.

In the last few years considerable has been written on the subject of imperfect castings, and many and varied have been the reasons advanced to account for the existence of pin, gas and slag holes, interior shrinkages, draws, cracks, and the like. The supposition that these undesirable manifestations are solely due to molding troubles, bad sand, air in the molds which can not escape fast enough, bad design, or an improper mixture of metal, does not always convince the experienced foundryman. He has, however, no other recourse than to correct what he can in his practice as he sees it, and trust that he will soon run out of his bad run of luck. Usually by the time things begin to get irritating, the castings have all been made, and the trouble is forgotten for the time being.

For a number of years it has been my feeling that aside from causes easily seen and remedied, the fundamental difficulty in nearly all cases of imperfect castings lies deeper and may be found directly in the manner in which the stock is melted down. In other words, that there is something about every melting process, whether cupola, air furnace or open hearth, that must be taken into account, otherwise a greater or less number of the castings made will show spongy spots, pinholes, etc., when machined.

It is the purpose of this paper to go into the subject a little, to try to give the probable cause, and suggest a remedy for much of the above mentioned trouble.

Foundrymen will remember that several years ago a very elaborate series of cupola melting tests were made at the Government testing plant in connection with the St. Louis exposition, and the year thereafter I was in charge of this work, and present at nearly every individual test, and hence could observe the peculiar behavior of the several cokes tested out. A large number of cokes made on the premises from coals gathered all over the country, and selected specially for their probable usefulness for foundry purposes, were run through two small cupolas under standard conditions, and results noted. The series of tables subsequently published, while giving the coal producer information of direct value to him for his special use, also demonstrated a number of things for the foundry which would have been impossible to get in ordinary practice, as no one individual could afford to burn up a lot of valuable iron in order to derive information therefrom.

As these tests really form the basis for what is to follow, a few words in further explanation may not be amiss. The Technological Branch of the U.S. Geological Survey coked a great number of coals sent in by producers all over the country. Wherever these cokes showed a composition anywhere near foundry requirements, some were set aside for melting tests. In all some one hundred and ninety tests were made. Three thousand pounds of metal were melted in each test. In order to have uniform conditions for the coke bed, and still suit the average coke made, fourteen inches above the lower tuyeres was selected, and this height kept for every test. The upper tuyeres were kept closed. A melting ration of 7 to 1 was adopted. The coke used for the bed was weighed as put in to the proper mark. In this manner, measuring the height of the bed by a wire and weight dropped in, the exact amount of coke used could be noted. This weight varied from 180 to 230 pounds, showing quite a range in specific gravity. Four times this weight was charged in metal for the first charge, and the successive charges of coke and metal remaining to hold the ratio at 7 to 1 divided up into four parts, coke varying from 50 to 62 pounds, and the metal correspondingly.

Blast was put on—about 7 ounces—and the time noted when iron began to show at the spout. Iron came in 5 to 15 minutes. This is interesting as indicating the rate at which coke was consumed, and the iron brought into the melting zone. With the best results the iron came in 7 to 10 minutes.

Necessarily for the extremely light and the unduly heavy cokes this melting practice would spell disaster, and it did so, the melting loss showing this up very markedly. Possibly this may convince many foundrymen who think it impossible to burn iron in the cupola. The results show this melting loss to be from 3.2 all the way up to 52.5 per cent. of the metal charged. The cupolas were constantly slagged off, but in the worst case above mentioned, so much slag was made that it flooded the tuyeres, and effectually stopped operations. When bottom was dropped, there was no metal remaining. It was quite evident that with the lighter varieties of coke, they burned away so fast that the metal came to the lower portion of the melting zone much earlier than it should. Hence metal was burned directly by the blast. The first heavy charge, in melting, lowered this coke bed to a point which not only ruined the metal melted, but also prevented the subsequent charges of coke from restoring the bed to its proper level again. The burning therefore continued, and a very bad heat resulted.

Heavy Cokes.

Now taking the very heavy cokes. Here it was necessary to wait quite a while before the bed had burned low enough to begin melting. Necessarily to keep the ratio of one to four for the first charge, a very heavy one resulted. Here again the coke bed was lowered unduly in melting this first extra heavy charge, again bringing the metal too close to the blast. Result—burnt metal. The trouble in such cases, however, was aggravated by the fact that the subsequent coke charges were very small—too much having gone into the bed and being burned away without effect, remembering that the ratio of 7 to 1 was maintained in the heat. Hence again difficulty, and bottom dropped with a lot of unmelted pig iron remaining. The fuel became insufficient to even support the Bessemerizing influence of the blast.

So it will be seen that where the melting process with a given coke and conditions normal gives good iron, it does not necessarily follow that any other coke will act the same, and hence many are the mistakes made in using new varieties of coke in a foundry without studying the conditions that should obtain to get results from them.

Burning Iron.

A word about burning iron in the cupola. Those who have watched the making of the iron silicates can realize how very little silica can carry great quantities of iron to make a thin black slag. In the heating shop where steel or wrought iron billets are gotten ready for the hammers, this process can be watched very nicely. The regenerative system of heating the modern furnace keeps things intensely hot in them, and as the billets become red and then white hot the metal oxidizes and wastes away rapidly, uniting with the sand bottom to a rich silicate, which flows out of the back of the hearth in a steady thin stream. This material is prized by the furnace as a wash and is easily 60 per cent. and over in iron content. In the bottom of the open hearth furnace, after a malleable heat, oftentimes pools of iron remain which rapidly oxidize, burning with a display of fine sparks, to disappear after uniting with the sand bottom as a dark spot on a fiery surface. Of the Bessemer process nothing need be said here, as the burning of the metal is a self-evident proposition, though theoretically the iron goes last. In the blast furnace one has only to note that

* Read before American Foundrymen's Association.

the same sized furnace which produces 250 tons a day under one set of conditions, and makes good honest iron for the foundryman is made to yield double the amount in another place, with a corresponding diminution in value to the foundry. Some of the metal made gets oxidized before arriving in the crucible. In the cupola it is a simple thing to watch the scintillations from the drops of iron falling through the coke bed. Every little shot is thus coated with a skin of oxide as it passes the fresh blast and goes into the bath below. Just how much this oxidation amounts to depends upon the position of the stock with reference to the melting zone, as the material runs off molten.

Whether the blast attacks the lining and this eats up the oxidized metal, or the oxidized metal unites with the ash of the coke, needing so little silica, matters very little. The slag formed eventually gets blown upward and to the sides, the rich iron oxides greedily eat the lining, and great quantities of slag result. In the case above cited where the melting loss was over half the metal charged, the slag contained 43.50 per cent. iron.

A study of the St. Louis results leads one to look into the melting process a little. Melting in the crucible has always given the best results, and simply because the oxidizing influences are at a minimum. In the air furnace, proper attention to the melting, and doing away with the thin edge of molten metal on the sand bottom, by making this approach the open hearth shape more, does away with much of the oxidation resulting in weak metal. In the open hearth as well as the air furnace, the reduction of the time in melting does more than anything else to keep the quality of the metal up. To reduce this melting time means a first-class knowledge of the process.

In the case of the cupola things are more complex. It is necessary to see what functions each part of the operation serves. Take the coke bed; this may be divided into three parts. The first is that portion below the tuyeres which serves as a filling. It occupies the space intended to hold the molten iron, and holds up the balance of the charges. The second portion of the bed is that just above the tuyeres and up to the zone of melting. In this space the blast has its oxygen more or less converted to carbonic acid and carbonic oxide. The third portion is incandescent coke at which the actual melting takes place. The second and third portions of the coke, of course, shade into each other, the temperature of the coke rising from the comparatively dull heat of the bottom filling, to the hottest part at the melting line. As the metal melts, this line—if it may be so called—naturally drops downward, and when all of the first charge is gone, the first intermediate coke charge gets on the bed, bringing it upward again. The second charge of iron is melted, the bed dropped in so doing, and again the next intermediate coke charge brings it up again. And so on. On the nicety of the charges depends the rate of melting, melting loss, and a number of other things.

That practically only the portion of the coke above the tuyeres does any melting is proven by the fact that in many foundries where it is not desired to hold any metal in the cupola at all, the tuyeres are placed a few inches from the bottom. Again, that the lower portion of the coke above the tuyeres is also not effective for good is shown by the damage done when the iron gets too low. Hence the upper part only of the coke charge should be counted as effective, and study be given it to see how it can be made most so.

Coke Bed.

The first question that presents itself to the thinking mind is why—if only the upper part of the coke bed does the melting, and this part being used up in so doing, is replaced by the small coke charge above—why is the first charge in cupolas made heavier than the rest? It seems unreasonable, in fact absolutely incorrect to do so. Think a moment—iron does not begin to melt until the coke has burned down to the proper point. It takes more coke burned away after melting starts, to care for a big first charge, than for a little one, such as the ones subsequently used. Therefore with the big charge, the coke bed has been lowered so much that the subsequent coke charge does not restore the bed to its original height—in fact far from it. The second iron charge therefore does not begin to melt where the first one did, but much below it. Result—burnt iron in both cases. This goes right on for every succeeding charge, the latter end of each being too low and near the blast which at this low point contains a lot of unconsumed oxygen. Usually we find that the intermediate coke charges are just a little large, and gradually the line of melting is brought back to where it should be, and hence the burning trouble is confined to the first part of the heat. One often hears that toward the end of a heat the iron comes slow, and by cutting the coke in the last charges a little, quicker results are obtained. This is simply due to the extra large coke charges bringing the bed above the melting line, and hence coke must be burned away to get the iron into the proper place again for melting.

The conclusion that one must come to—if the reasoning is correct—is that the first charge shall be no larger than the others succeeding.

Charges.

The second thought that comes from this is the natural result of the first, and that is—if the unreasonable fluctuation of the melting zone produced by an excessively large first charge does damage to the metal, then why not make all the charges not only alike, but as small as it is possible to make them, in order to hold the melting line as constant as possible.

Herein lies the change I suggest in cupola practice as it is carried on to-day. I have tried this method repeatedly in the last year with remarkable results, nearly all the imperfections mentioned in the beginning of this paper being wiped out wherever the charges were made very small, the bed started off at the right height, and that the intermediate coke charges proportioned in such a way that uniform melting resulted throughout the heat, and of course the chemical composition correct, and charging and melting accomplished with care.

The bed may be accepted as of proper height when iron comes at the spout in seven to ten minutes, the latter time being preferable. The charges are made so small that the proportionate amount of coke between just covers them and no more, say from two to four inches in depth. The ratio of iron and coke is kept just the same as previously in starting off this way, except that after deducting the coke for the bed from the sum total of coke charged, all the iron and all the coke left is divided up into equal and small charges. After running a while it will invariably be found that the coke can be reduced somewhat as the small charge system keeps the melting so uniform that the fuel formerly used in making slag and keeping it hot, is applied for melting iron.

It may be of interest to say that with cupolas of about 54 in. inside diameter, the metal charges have been made as low as 750 pounds each, and with admirable results. In general however, it is well to be guided by the coke between the metal charges, keeping this down to the smallest convenient amount, and making the metal charges proportionate to hold up the melting ratio. In this way there is a quick succession of coke layers to keep the bed right up to the proper level. In no case is the metal

charge so large that the melting line is lowered very materially, and hence a minimum of iron is burned. The consequence of this is the practical wiping out of pig holes, the removal of draws, gas pockets, lessening of strains which mean cracks, and the closing up or rather prevention of spongy metal. All this, of course, not in its entirety, but in so great a measure that the discount is lowered to a highly gratifying extent. I could name case after case, where upon being called in to assist over much difficulties, this simple and logical—I think it charging method, has accomplished everything that could be desired. I take pleasure, therefore, in giving it to the foundry public, for their criticism and trial if they choose to do so. It may help someone who has castings to make which are machined and put under pressure tests.

I need not call attention to the greater uniformity in the mixture attained by this small charge method. This alone would commend it to the smaller jobber, who oftentimes has either no bull-ladle, or a very small one, holding say half of a charge only.

My own suggestion for charging a cupola, especially for big heats, would be somewhat on the following line:—Have the cupola cut off, say six in. above the platform, and arrange a hood further up to draw off the gases. (This I believe is done in England in some places). Have a large cylinder slightly smaller than the inside diameter of the cupola, and provided with a drop bottom. Place the charges for the cupola inside this cylinder, or several of them, laying the metal, scrap and coke evenly and carefully. Do this in your metal yard. Then transport to the cupola, run directly over it by some overhead method, and drop the charges squarely into the cupola. This will reduce the platform labor to next to nothing, allow the charges to be weighed by crane scale overhead, and laid right, and mean only one handling in the yard. It would be mechanical charging in its best sense, and rather more effective than the present blast furnace hoist. Moreover, charging could not well be made any cheaper.

COMMON SENSE.

This question was asked upon an examination paper: "What steps would you take in determining the height of a building, using an aneroid barometer?"

The answer was: "I would lower the barometer by a string and measure the string."

Modern Practice in the Pattern Shop and Foundry*

Old Methods Have Passed Away and New Ideas have Revolutionized Patternmaking, Making Possible Great Savings in the Foundry.

By JOS. LEON GOBEILLE **

This is a transition period in patternmaking as it is in the foundry business. The most curious thing about us humans is our indifference and unalertness to change. The telephone came and altered all accepted precedent; nobody noticed it. The automobile crop is right now of more value in dollars than that of cotton or gold. The flying machine will be common when next we meet. So with the venerated and venerable pattern-shop. The molding machine is also coming, mighty fast, too.

Passing of Pioneer Practice.

The old folly is passing of setting a mechanic in wood to make a rigid model of some intricate casting which will be, not fabricated at all, but poured in liquid. This foolishness is about to depart along with "How to temper copper" and "Who was Cain's wife?" The pattern-shop of our boyhood had its traditions, but it has come to pass that the man most learned and expert in those ways is really the least important thing in the pattern-shop of today. Why, there is almost no gearing used in this century—everything goes by belts, ropes, friction or is "direct-connected." Gears of precision are cut anyway and a lot are not metal at all, only rawhide. So the pattern-shop need not keep an expert gear-maker. Cast-tooth gears from patterns are no longer called for. If they were wanted, we have a fine gear-cutter more accurate than any mere man, doing nothing most of the time.

Concrete Patterns.

After fooling away a lot of time I decided to add a separate department and make some patterns out of concrete. In an Italian image-maker's shop on Chestnut Street, Philadelphia, I found my man. He was "a artist" and was very much surprised and grieved when I started him on a housing to weigh about 16,000 pounds instead of on a group of figures, Cupids, Psyches, etc. My man was just a little different from the common or garden variety of patternmaker. He did not know it all and he was a fine, honest worker. He furnished his own reinforcing. I learned since that in an old steel mattress, which he picked up on the dump and hauled to the shop himself, and a few feet of barbed wire appropriated from a chicken fence in the suburbs, he had procured the best kind of reinforcing and bothered nobody.

Now for the part that will interest you. A housing priced at a wage cost of $432, my Florentine friend got out for $71.60 and we made a good casting from it. I was paying him $9 a week, so much to his surptise, I raised him to $2 a day. He is now not afraid to tackle a water-jacketed automobile cylinder or a cast-together tandem-compound, core-boxes and all. To get his water-course and steam-port section superficies, he pours the core-box with plaster, saws one-inch sections from the cast and weighs these sections against 1-inch cubes of the same plaster used as weights on a common candy balance. It is obvious that the number of cubes necessary to balance any slice represents the number of square inches of superficial area in that part no matter how crooked or intricate the out-line may be. So we built a dog-house to our pattern-shop and put into it this man with two helpers, who will themselves be experts in a year or two, on $6 and $7 per week respectively!

Now when so many molding machines are in use it is desirable to short-circuit, working not from the blue-print to the pattern but directly to the plate itself. Instead of all the expensive iron and brass patterns with two shrinks to allow and the thousand chances for inaccuracy, we must arrive by carving or modeling the piece wanted in one shrink and working directly onto the plate. This in practice necessitates another dog-house for a first-class white-metal molder. It should adjoin the concrete man's room.

I may confide in you to this extent: my plaster man was from sunny Italy, my molder from the land o' cakes. What a Scot will say out loud about a Dago, and what a Florentine thinks about a Glasgow man, is not suitable to put into words before this respectable company. What to do, well I didn't know. Finally, I worked most of my plates with a Hungarian greenhorn in charge. He molded lovely plates but was slow.

Jolt Rammer Introduced.

One wonderful thing about present-day pattern-shop practice is due to the

---

* Address before Pittsburg Foundrymen's Association.

** Address, care of Gobeille Pattern Co., Niagara Falls, N. Y.

rise of the jolt-rammer. It is possible to handle boards 36 by 48 inches in at least one of the new machines and make anything at all, large or small. After two years' pretty close connection with the jarring type I am convinced of its entire practicability for small and light work and for stove plate, as well as for heavy castings. The man in charge must know how to run it just as in everything else, the automobile for example.

The trouble with the jolt machine is that it needs common sense to get results and common sense is scarce. Think a moment. That bump-bump-bump, 19 times, bumps something else besides the sand, flasks, bars, patterns. All catch it and must be made with a degree of strength and accuracy not demanded elsewhere. Make your flasks of solid iron, no joints at corners. Make them absolutely interchangeable, tool steel pins ground to 1,000th of an inch and fitting a 1,000th of an inch tapered reamed hole. Have them so accurately made that any cope will fit any drag.

Man and Molding Machines.

Don't get it into your cosmos that the man running the machine needs any special mental endowment. I tried a mechanical engineer, graduate of a good technical school. No go! He couldn't even shake out cores in the old jolt-rammer. So I hired a Russian who combined the trade of button-hole maker with a physique which stamped him a veritable Vulcan. He was a greenhorn and spoke no language but Russian except a few Hebrew swear-words. All the conversation I ever had with him was this, bump-bump-bump-bump-bump-bump-bump. He understood and could even increase the number of jolts, if his air was down 20 or 30 pounds, without any profanity on my part. That was one qualification. The second was, he was so big and strong, so bearded and so fierce-looking, the molders were afraid to rough-house his machine or him. Once when he lost a mold because some molder had buried a sponge in his sand he wrecked three of the foundry windows and broke two shovels with his hands. That was enough, Strosky never was called upon to jar-ram any more sponges. I pacified him, but dreamed of button-holes and wrecked foundries at intervals for weeks afterwards.

Advantages of Jolt Rammer.

Another advantage of the jar-rammer in combination with the concrete man might be illustrated in this way. We wanted a shell-like casting for a gear-case. We modeled this in clay and took an impression in plaster of the male side which was to be our drag. We then made a reverse, by processing, and poured a female from which we made our cope. These were poured in hardened concrete in an iron flask, allowed to dry, rammed up separately, put together and poured from hand ladles. We never had a pattern, but got a fine perfect casting. Size was about 18 by 38 by 13 inches deep, 22 indentations, bosses and oil courses, irregular in shape, $\frac{3}{8}$ inch thick, weight 228 pounds, cost of patternmaker's time $9.20, and all from a blue-print one-quarter size.

Another photograph from life! A certain 60-inch pipe bend, T-valve and end connection, cost $628, and was destroyed by fire. The insurance companies settled. We replaced the patterns (from castings) in concrete for $52. The adjuster came around and saw the finished job. Here is what he said, "Does this stone work cost much more than cherry?" "No." "Not half as much again does it?" "No." "Well, it's worth it, makes a harder pattern and can't burn," said the adjuster. In that one item the poor unfortunate foundryman who had the fire sold out to the insurance company so as to make a clear profit of $576 on an investment of $52.

If your flasks are right you can get a hundred castings from an ordinary concrete pattern and then make a new one for less than you could patch up, varnish and store a wood pattern. Gentlemen, believe me, the reinforced concrete pattern is a wonder. I have no monopoly of it. Buy a barrel of cement collect an Italian and try it out for yourself.

The way to keep things even or to change work on the big jolt-rammer is almost too simple for words, only it seems that nobody gets onto it. Make a standard plate for all small work, 12 by 16 inches. That will be nine for each big board, 36 by 18 inches. These multiples are interchangeable and bolted in place, so when one casting runs ahead, take out its multiple and replace with something else, or if it runs short make an extra plate, substitute for something not pressing and double the output. Very simple, and this is now being worked out in practice.

Non-shrink Alloys.

One word about alloys. There is now on sale a metal that is practically non-shrink, but what the new era pattern-shop wants awfully bad is a white alloy that will take solder and expand in cooling $\frac{1}{8}$ inch instead of contracting that fraction. Think what that would do for you. A casting from a broken casting would make an absolutely accurate working pattern.

I have made in vain a hundred mixtures seeking this Philosopher's Stone. When it is discovered the stove founder will go into deep mourning, for patterns for repairs that will fit any given stove could be made from the casting itself or a new pattern stove duplicated in its entirety exactly right in size.

Water expands thus on cooling; a cubic foot of water makes a nice plus in volume when it cools to ice. What else does? Especially what other material which combines with copper and aluminum?

Cutting Expenses.

Finally, gentlemen, if you do not believe in radical changes, I can suggest three things which will cut down your pattern expense very materially:

First comes the rearrangement of your tools. To-day in most pattern-shops the tools are put in helter-skelter—a skilled workman will put in more time walking and carrying his lumber than in the actual operations involved. Change the disposition of your tools so that the natural operations may be sequential. Nearest the lumber racks the cut-off saw; then the big jointer, the surfacer or pony planer, next, your combination cross-cut and rip-saw, band-saw, jig-saw, segment-cutter and your big trimmer, in the order named, and have one of the new toy jointers conveniently near the bench of every man. They are twice as helpful as any trimmer.

Specialists in Pattern Shops.

The second source of saving is in having a good foreman. A bright, ambitious, young man just out of his time, who has taken a course in mechanical drawing, makes a splendid man for foreman. Do not select one who knows too much about patternmaking, or depend on him for carrying out intricate valves or cored work. He can hire men for 40 cents per hour who know all about such details. A young man right out of a good technical school makes a splendid foreman, one who will get out work and keep accurate cost accounts.

My third suggestion is a careful division of labor; if you run more than 25 men you will be able to save more than 25 per cent. right at the start.

Get a good turner and allow him to do nothing else. A good man on beds and housings, give him a gang of five men to help him and keep him at that and similar work all the time. The same with cylinders, small valves, parts, fittings, etc. Each man at what he can do best with cheap help will cut your average wage rate 15 cents per hour.

Many of your men run big shops. Have in them nothing but the group or gang system with a mill gang, dimension gang, assembling gang, finishing gang and a varnishing gang.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

The Central Foundry will build an addition to their foundry at Port Hope.

Macarthur & Mann will operate a smelter and iron works at Victoria, B.C.

The Northern Foundry & Machine Co. will erect a pipe foundry at Winnipeg.

The Western Sheet Metal Works, Vancouver, will build a $2,000 additions to their plant.

The St. Lawrence Car Works, Quebec, will erect a plant in that city with a capacity of 600 cars yearly.

The C. T. Renaud Co. will build a $100,000 plant in East Calgary to manufacture stoves and kitchen ranges.

The Ledgewood Mfg. Co., New York, will erect a plant for the manufacture of logging machinery at Lachine, P. Q.

The C.P.R. will remove their machine shops from Wellington, B.C., to Vancouver island, as soon as a location is secured.

The present premises of the Steel Wire Works at Guelph are too small for their increasing business, so they will extend.

Plans for the John Deere Plow Company's building at Saskatoon are nearly completed. Construction will begin March 1.

Brownell, Lindley & Co., Manchester, Eng., manufacturers of engines, will establish a branch of their business at Montreal.

The Canadian American Gas and Gasoline Engine Co., will erect a foundry and machine shop at Dunnville, Ont., to cost $45,000.

The C.P.R. has purchased four hundred acres adjoining Souris, Man., presumably for a shop site to serve the southwestern lines.

Owing to increased business the International Harvester Co. has decided to spend $100,000 in making improvements to its plant at Hamilton.

Joseph E. Gamache and Victor Langelier have been registered as machinists at St. Hyacinthe, Que., under the title of Gamache & Langelier.

A movement is on foot to move the West Lorne foundry at Glencoe, Ont., to Rodney and run it under a joint stock company capitalized at $10,000.

The Goold, Shapley & Muir Co., Brantford, have let the contract for their new machine shop and erecting room, which will be 180 x 132 feet.

Work is being commenced on the new C.P.R. car repair shop being built to replace the one destroyed by fire at Nelson, B.C. Estimated cost, $2,500.

The Vulcan Iron Works, Winnipeg, has purchased 20 acres adjoining the Dominion Bridge Co.'s works for $60,000, in order to provide for future extensions.

Additions will be built to the plants of the Otis Fenson Co., the London Machine & Tool Co., and the Canadian Drawn Steel Co., all located at Hamilton.

The Charlottetown Foundry & Machine Co., Charlottetown, P.E.I., have sold their business to Bruce Stewart & Co., and the latter company has been incorporated.

The Comet Foundry & Machine Co., Owen Sound, manufacturers of factory trucks, dry kiln trucks, municipal steel bridges, intend enlarging their plant this year by the erection of a new machine shop.

Following a recent visit of the officers of the Gananoque Spring & Axle Co. to their Chatham plant, formerly the Dowsley Spring & Axle Works, it is announced that a new office will be erected and much new machinery installed, the outlay amounting to probably $15,000.

An extension of the ornamental iron department of the Canada Foundry, Toronto, is in course of construction, which will cost about $50,000 and increase the capacity of the department by 25 to 30 per cent. It will be completed in April when the present force of 225 men will be increased to about 300.

The Kingston Shipbuilding Co., which takes over the Government dry dock, on April 15, is making preparations to erect a large building for shops. The structure will be 120 feet long, and two storeys high, it is understood. All the most modern machinery is being purchased, and will be shipped there shortly.

John Millen & Son, Limited, Montreal, have been appointed sole Canadian agents for the Chisholm & Moore Manufacturing Company's line of chain hoists and trolleys. The chief of these is the "Cyclone" high speed hoist with self-lubricating bearings. The other hoists include both the screw and differential types.

Official announcement is made that a syndicate, composed of E. R. Wood, Toronto, Clarence J. McCuaig, Montreal, and R. Harmer, Toronto, have concluded arrangements by which they secure control in the Sawyer-Massey concern of Hamilton, one of the largest manufacturers of threshing machines and engines in Canada.

The first annual meeting of the shareholders of the Brantford Steel Range Co. was held early in February, when a careful survey of the year's work was was made and everything found in a satisfactory condition. It was decided to increase the capital stock of the company and A. L. McPherson was appointed secretary and general manager. Mr. Stamford is being retained as superintendent. The old board of directors was re-elected as follows: President, John Muir; vice-president, L. W. Ryerson; treasurer Geo. H. Wilks; Jos. H. Ham and W. R. K. Stamford.

The annual meeting of the James Pender Co., wire nail manufactuturers, was held on Feb. 2, when the following officers and directors were elected:—G. S. Fisher, president; H. R. Sturdee, secretary-treasurer, James Pender, managing director; Joseph Findley, J. Fraser Gregory and J. B. Purdy, additional directors. An offer was made to the stockholders by Montreal capitalists interested in the new Lake Superior Milling Co., at Fort William, to purchase the stock of the company at $215 per share. The par value of the shares is $100 and big dividends have always been paid. An offer has also been made to Mr. Pender to assume the management of the new company at Fort William and the decision of the stockholders to sell their holdings will depend largely on whether or not Mr Pender goes to Fort William, though even in that case he would still be the real manager of the St. John company, which would be the maritime province branch of the other. Although the stockholders are reticent about the offer, it is understood that those who desire to buy are offering 75 per cent. in bonds and 25 per cent. in stock of the new company.

Municipal Undertakings.

Another reservoir has been recommended to be built at Kamploops, B.C.

Edmunston, N.B., has agreed with the G.T.P. to put in a waterworks system.

The New Westminster council will advertise for new tenders for the city incinerator.

The civic officials of Fort Erie, Ont., favor the construction of a waterworks system.

The Board of Control at Hamilton awarded to the London Brass Co. the contract for the brass work for water mains at $3,000.

City Engineer Rust, of Toronto, in his estimates for 1910 asks for $225,151 for new fire and water mains.

Vancouver will this year add from 14 to 25 miles to its waterworks system. Mains will be constructed on 40 streets.

J. Galt, consulting engineer, has reported in favor of a project to instal a gravity system water supply at Edmonton.

For the repair of the Third Avenue sewer at Vancouver $2,100 was set apart; and $1,000 will be expended in continuing the sewer on York Street.

City Engineer Ker, of Ottawa, has laid before the Board of Control a drainage scheme, which will take three years to complete, and will cost $350,000.

Tenders are being called for by J. W. Truesdale, city clerk, of Saskatoon, Sask., for materials required for house sewer and water works service connections, etc.

Calgary water commissioners recommend that a by-law for $242,000 be introduced and submitted for a vote of the ratepayers for the construction and extension of water mains in that city during 1910.

The Hamilton Works Committee passed estimates amounting to $356,000. Among other items were: sewers, $11,150; waterworks expenses, $65,-250; sewage disposal, $19,154; waterworks construction, $94,000.

Structural Steel.

Strickland Bros. got the contract to erect a foot bridge attachement to the C.N.R. bridge at Saskatoon.

The Laurentian Construction & Engineering Co. were awarded the contract for a bridge at Adamsville, Que.

The sub-structure for the Wolf Creek bridge at Edmonton, will be ready for the steel early in the spring. Chas May is the contractor.

The Dominion Bridge Co., Lachine, have been awarded a contract for structural steel for power racks and tail race bridge by the Canadian Light & Power Co., of Montreal.

The Great Northern Railway have given orders to their engineers to prepare plans for permanent steel bridges over the railway cuts across Park and Victoria drives at Vancouver.

City Engineer Rust, of Toronto, recommends a new bridge at Turner's baths, Toronto Island, to cost $9,268; Dundas street bridge widening $19,000; Park Drive bridge, $5,000; and Weston road bridge, $30,828.

Electrical Notes.

The St. George Electric Co., Sherbrooke, will build a new concrete dam and electric plant on the Chaudiere river.

It is reported that the provincial government will spend about $20,000 on the telephone plant at Prince Albert.

Kenora will pay out $80,000 for a municipal power site. The Hudson's Bay Co. receives $45,000 and the Keewatin Power Co., $35,000.

The Toronto Board of Control decided that the City Engineer should build the electric pump building at the high-level pumping station by day labor.

A by-law to raise $77,000 for the erection and development of a municipal power plant at Renfrew will be submitted to the ratepayers in the near future.

The Revelstoke, B.C., council have decided to enter into a five-year contract to supply the C. P.R. with power. A new power plant is being installed by the municipality.

General manager Nichols, of the Canadian General Electric Co., states that between $250,000 and $750,000 will be spent on new buildings and equipment at Toronto or Peterboro.

F. Barber & Son, of Meaford, are instaling a second set of water wheels at Croton for the Delhi Light & Power Co. A new Canadian General Electric Generator is also being installed.

Contracts involving an expenditure of $53,000 have been awarded by the B.C. Electric Co. for their first unit at Jordan River. The John McDougall Caledonian Iron Works Co., Montreal, have the contract.

An important extension to the N., St. C. & T. Railway will be built this spring, when a line will be constructed from Port Colborne to Fort Erie and Bridgeburg, connecting Niagara-on-the-Lake with Crystal Beach.

Railway Construction.

The Canadian Northern contemplate spending $5,000,000 on terminals at Montreal.

The C.P.R. intend double-tracking their road between Winnipeg and Portage la Prairie, a distance of 56 miles, this year. This will eventually be extended to Moose Jaw, a distance of 400 miles.

Wm. O'Brien and a syndicate of eastern promoters will, this summer, construct a line of railway which will open up the coal fields of the Yellow Head Pass Coal and Coke Co., west of Edmonton.

The I.C.R. is calling for tenders for the construction of a line of railway between Nelson and Chatham, N.B., eight miles. Tenders are also being called for the construction of a new branch railway between Georges River and Sydney Mines, C.B., a distance of nine miles.

A new company is being formed to control the Moncton and Buctouche Railway, and the names has been changed to the Buctouche Transportation Co. This company has already applied for a Dominion charter to extend the road to Richibucto and to carry on a service between the mainland and Prince Edward Island.

Now that the contract between the British Columbia government and the Canadian Northern has been completed, ready for presentation to the legislature, the announcement is made that grading will commence very shortly. It is the intention to rush work on this line so as to have it completed to Vancouver in the least possible time, and it will mean considerable business for all lines. With the construction of the G.T.P. in the north and work proceeding on the coast sections of the V.V. & E., there is much activity in railway building in British Columbia.

The promoters of a new radial railway to run between Toronto and Orillia are applying to the Ontario Legislature for incorporation. The name of the concern is the Monarch Company. The proposed line parallels the Metropolitan as far as Aurora, where it turns, passing through Holland Landing, Bradford, Deerhurst, Churchill, Stroud and Allandale. A number of branches are proposed, one to western shore of Lake Simcoe in the summer, and another to Markham. The capital is placed at $1,000,000 with bonds to the amount of $2,500,000. The incorporators are: W. H. Price, Chas. M. Garbey, Jas. F. Coughlin, N. R. Lindsay and Steffan F. Adalia, the latter representing French capital.

Planing Mill News.

McDiarmid & Clark will erect a large sash and door factory at Brandon.

A. Beaumont's sawmill, near Augustin, Que., was destroyed by fire recently.

The planing mill at Huntsville, Ont., which was damaged by fire will be rebuilt at once.

The St. Anthony Lumber Co., Whitney, Ont., will erect a large furniture factory at that place.

The Bay Chaleur Lumber Co., Campbellton, N.B., will erect a new mill at Mission Point, to replace the structure burned last season.

General Manufacturing News.

The Acme Brick Co., established last year at Edmonton, finds its output increasing so rapidly that extensions are now under way in preparation for the coming building season.

The Great West Saddlery Co., Winnipeg, is running almost night and day in order to keep up with western Canadian demands. E. F. Hutchings, president of the company, stated that as soon as the spring opens up his firm would erect an additional factory across the street from its present location. The structure will cost in the neighborhood of $75,000. The company will also build a horse collar factory at Calgary, Alta., which will cost about $5,000, and will as well make additions to its wholesale warehouse at Calgary. Mr. Hutchings says that the whole of the Winnipeg plant will be run night and day during the coming year.

Building Operations.

The armory at Regina will be erected at a cost of $100,000.

A $76,000 station will be built by the C.P.R. at Woodstock, N.B.

The Dominion Chair Co., will rebuild their factory at Bass River, N.B.

Horn Bros., Lindsay, will erect a large addition to their woolen mills.

Barker and Johnson, of Edmonton, will erect a new flour mill at Lloydminster, Sask.

Townsley & Son, Minneapolis, have secured a site at Brandon for a factory building.

The Northern Foundry and Machine Co., Winnipeg, will erect a $10,000 pipe foundry.

Work will be commenced at once on the enlargement of the C.P.R. hotel at Vancouver.

The Toronto Bedding Co. will build a three-storey addition to their factory at Toronto to cost $21,000.

T. Pringle & Sons, Montreal, have awarded the general contract for the erection of a plant for the Shawinigan Cotton Co., to C. E. Deakin, Montreal.

The Canadian Asbestos Mfg. Co., a large American concern, is building a factory at Lachine for the purpose of manufacturing fireproof asbestos materials.

Superintendent Bishop, of Toronto's Board of Education, has been asked to prepare plans for the new Technical school there, of which the estimated cost is $500,000.

The Peter Whalen property at Ottawa, has been purchased by the Hugh Carson, Ltd., as a site for the company's new factory, which it is stated will be six storeys in height. Work will be started at once.

As a result of a visit recently paid to East Kootenay, B.C., by Eduardo Rioudel, an eminent financier of France, who is president of the Canadian Metal Co., which operates the Blue Bell mine at Riondel, B.C., an establishment for the reduction of zinc ores into zinc oxide, a property similar to white lead, used in the manufacture of paint may be built at Riondel.

New Companies.

Port Arthur Wagon Co., Port Arthur; capital, $750,000; to manufacture conveyances, machines and implements. Incorporators, J. R. L. Starr, J. H. Spence and M. C. Cameron, Toronto.

The Fletcher Pulp & Lumber Co., Sherbrooke; capital, $300,000; to make lumber, wood products and pulp and paper. Incorporators, C. H. Fletcher, R. A. Ewing and R. H. Fletcher, Sherbrooke.

The Charles A. Marsh Co., Montreal; capital, $100,000; to operate cotton, woollen and textile fabrics of every kind. Incorporators, R. O. McMurtry, F. G. Bush and H. W. Jackson, Montreal.

The Metal-Bound Box Co., Montreal; capital, $700,000; to manufacture and deal in all kinds of boxes and furniture, etc. Incorporators, R. C. McMichael, R. O. McMurtry, W. R. Shanks, Montreal.

Sawyer-Massey Co., Hamilton; capital $7,000,000; to make steam, gasolene and oil engines, locomotives, agricultural machinery, wagons, etc. Incorporators, J. S. Lovell, Wm. Bain and Robt. Gowans, Toronto.

The Wrought Iron Range Co., Toronto; capital, $100,000; to manufacture and deal in all kinds of wrought iron stoves and ranges. Incorporators, J. C. Holtby, A. W. Caldwell and Thos. Reid, Toronto.

Rice, Green & Co., Toronto; capital, $40,000; to manufacture and deal in electrical supplies, fittings and machinery for the supply of light, heat and power. Incorporators, A. R. Rice, G. W. Close, and P. Soliague, Toronto.

The Regal Motor Car Co., Walkerville; capital $50,000; to manufacture and deal in automobiles, cycles, bicycles, motors, and carriages and conveyances of all kinds. Incorporators, J. E. Lambert, F. Haines, C. R. Lambert, Detroit.

The B.C. Gazette gives notice of the incorporation of the following companies: B.C. Ornamental Iron & Fence Co., capital $10,000; Fraser River Brick & Tile Company, capital $50,000; and Vancouver Gypsum Co., capital $100,000.

The Central Canada Power Co., Montreal; capital, $5,000,000; to construct electric machinery, appliances, devices, etc., and to operate telegraph and telephone lines. Incorporators, J. C. Hickson, S. B. Hammond, V. M. Drury, Montreal.

The Canadian Dart Co., Montreal., have been incorporated with capital of $50,000 to build, construct and equip public and private works, sawmills, stone quarries, etc. The incorporators are: W. Dart, F. H. Jefferson, and W. H. Brunning, Montreal.

Canadian Machinery
Toronto

Prince Rupert Coal Fields, Ltd., Montreal; capital, $5,000,000, to carry on colliery trade; to mine coal, and smelt and treat iron, steel, tin and other metals; and to refine oil and ... powder, etc. Incorporators, M. Alexander, D. B. Smith and T. D. Fillan, Montreal.

Hillcrest Collieries, Ltd., Montreal; capital, $5,000,000, to mine coal, coke, supply natural gas and oil, and to manufacture machinery, implements, etc., used in connection with mining, timber or lumber operations. Incorporators, J. M. Macken, A. H. B. MacKenzie, C. Meredith, Montreal.

Superior Rolling Mills Co., Fort William; capital, $500,000; to mine, mill, smelt and refine, gold, silver, copper, coal, iron and other minerals, to make wire nails, steel rails, iron bars, and refine oil, supply natural gas, etc. Incorporators, G. H. A. Montgomery, R. O. McMurtry and F. G. Bush, Montreal.

Dominion Corrugated Steel Pipe Co., St. Johns, Que.; capital, $20,000; to make steel pipes, culverts, metal sidings, agricultural machinery and to carry on a foundry business and operate rolling mills. Incorporators, C. H. Richardson, St. Johns; H. Proctor, Wm. Wakefield and A. C. Seller, Sandusky, Mich.; and Geo. Donaldson, Topeka, Kan.

A bill to incorporate the Ottawa and Montreal Power Transmission Co., will be presented to the House of Commons. Authority will be sought to transmit power in the counties of Wright and Pontiac, etc., and to Montreal. Capitalization, $500,000. Incorporators, Cameron Edwards, J. B. Fraser, R. G. Edwards and R. Blackburn, all of Ottawa.

Trade Notes.

The Canadian Inspection Co., have removed their Toronto offices from 37 Melinda St., to the Stair Bldg., cor. Adelaide and Bay Sts.

The Johns-Mannville Co., manufacturers of asbestos packing and other mill supplies, have opened an agency in Vancouver, their representative being Mr. Tackaberry.

Smart-Turner Machine Co., Hamilton, have supplied pumps recently to H. W. Ansley, Port Dover; C. A. Larken Lumber Co., Toronto; S. F. Bowser Co., Toronto; Canadian Paper Co., Windsor Mills; J. C. Mundell Co., Elora; Shea's Theatre, Toronto; Kinleith Paper Co., St. Catharines; Zimmerman Mfg. Co., Hamilton; Toronto Ferry Co., Toronto; Harris Abattoir Co., Toronto; Page Hersey Co., Toronto; W. Harris Co., Toronto; Delora Mining & Reduction Co., Delora; Allan Shoemaker, Berlin; Hamilton Steel & Iron Co., Hamilton, and McQuay Tanning Co., Owen Sound. They have also received an order for a 5-ton traveling crane from the Manitoba Wind Mill & Pump Co., Brandon.

International Asbestos Association.

The International Asbestos Association was recently organized at a meeting held in New York. Its membership is composed of representatives of American and Canadian mine owners and manufacturers. The interests at the meeting represented between 80 per cent. and 90 per cent. of the asbestos business in the United States and Canada. Included in the association are the largest producers and users of asbestos in the United States and Canada, among them the Amalgamated Asbestos Corporation, Limited, Keasbey & Mattison Co., Philip Carey Mfg. Co., Asbestos Protected Metal Co., Franklin Mfg. Co., H. W. Johns-Manville Co., Sall Mt. Asbestos Mfg. Co., Ling Asbestos Co., and the United States Asbestos Co. The aggregate capitalization of the concerns who are so far represented is over $40,000,000. The following were elected officers of the association: T. F. Manville, president; R. V. Mattison, Jr., vice-president; R. P. Doucet, secretary.

It is announced that the purposes of the association are the general exploitation of the uses of asbestos, particularly in the field of fireproof construction, co-operation between consumer and producer, cultivation of new markets, and development of processes whereby the wastes in the industry may be rendered commercially valuable. The association will establish a bureau that will be devoted to the aforementioned purposes.

One of the important factors in the association is the so-called Canadian "Asbestos Trust"—the Amalgamated Asbestos Corporation,—a combination of several of the most important Quebec asbestos properties located at Black Lake and Thetford, and which controls 80 per cent. of the output of these districts. The greater part of the world's supply of asbestos comes from the Black Lake and Thetford districts. Among the directors of the corporation are Hugh A. Allan, of the Allan Line Steamship Co., ex-assistant Attorney-general James M. Beck, Harry A. Berwind, of the Berwind-White Coal Mining Co., Geo. D. Crabbs, of the Philip Carey Mfg. Co., E. B. Greenshields, of Montreal, Robert Mackay, of the Canadian Pacific Railway, H. H. Melville, of the Canadian-Northern-Quebec Railway, R. V. Mattison, president of the Keasbey & Mattison Co., and H. E. Mitchell, of the Philadelphia banking firm of Cramp, Mitchell & Shober.

Asbestos is produced in Canada, Russia, the United States, Cape Colony, and the island of Cyprus. It is stated that the Canadian asbestos supply is practically inexhaustible and that it is the chief factor in the control of the asbestos industry of the United States and, in a marked degree, of the world.

Thompson Bros., Liverpool, N.S.

Thompson Bros., machinist, Liverpool, N.S., have erected large additions to their plant. Their new buildings are situated on the waterfront at Liverpool with both water and rail shipping facilities. The machine shop consists of a two-storey reinforced concrete structure, 61 feet long by 50 feet wide. The equipment consists of a ten ton planer and one of smaller capacity, five lathes, one shaper, one drill, one milling machine and one grinder. All these are new and of latest design to use high speed steels.

The output consists of sawmill machinery and pulp machinery, a large contract for pulp machinery for Clyde River being under construction. Ship work is a specialty such as steering gear, pumps, windlasses, capstans and steam winches.

The firm consists of W. J. Thompson and H. Thompson. They began in a small way in 1897 and have succeeded in building up a fairly good business.—D.W.

Disston Company Expanding.

Henry Disston & Sons, Philadelphia, Pa., have recently opened branch houses in Seattle, Portland, and Vancouver, to better facilitate the filling of orders and take care of the constantly increasing trade. These branches will devote their attention exclusively to the mill goods business, such as inserted and solid tooth circular saws, bandsaws, crosscut saws, cylinder saws, mill saws, stave saws, saw tools, machine knives, files, steel, etc. The Disston factory at Toronto, established only two or three years ago, having become too small a new site was secured on Frazer Avenue and the Grand Trunk Railway, Toronto, upon which two new buildings have been erected; one of two stories,

250 x 60 ft., the other being one story, 170 x 55 feet, into which they recently removed. These buildings have been equipped with the latest improved machinery for the manufacturing of mill goods such as circular saws, band, gang and crosscut saws. In the new plant the machinery will be motor driven in groups, the buildings heated with an improved hot air apparatus, driven by a fan and so arranged that the rooms can be kept cool in summer as well as heated in winter.

1910 Calendar.

F. Reddaway, 56 St. Francois Xavier, Montreal, manufacturers of Camel Brand cotton belting distributed a large office calendar printed in two colors. An instalation of a belt outside is a feature of the calendar.

Vancouver.

Large power propositions are being proceeded with in the vicinity of Vancouver and Victoria. The B.C. Electric Railway Co., which only lately put into operation its most recently installed unit at its Lake Buntzen plant on the mainland, is now developing the power on the Jordan River, to give more electrical energy for industrial and lighting purposes in Victoria. The Vancouver Island Power Co. is a subsidiary organization and on Jan. 29th it let the contract for a 10,000 h.p. Doble impulse waterwheel, directly connected to a 4,000 k.w. Allis-Chalmers-Bullock generator, running at 4,000 revolutions per minute, to the John McDougall Caledonian Iron Works Co. The contract also includes an exciting generator directly connected to a water wheel. The installation is to be completed by October 1st, 1910. The plant at Jordan river will be located on salt water, a pipe line 9,000 feet long being necessary.

Two-thirds of the electrical portion of the machinery for this plant is to be supplied by the Canadian General Electric Co. It includes step up and step down transformers, switchboards, lighning arresters, etc.

On the mainland, the Western Canada Power Co. is vigorously pushing development on Stave river, 35 miles east of Vancouver, just north of the main line of the C.P.R. After Montreal capitalists sold out the Mexican Light and Power Co. in Mexico to English capitalists, they took up this proposition, which was formerly handled under the name of the Stave Lake Power Co. R. F. Hayward, who was with the Mexican company, is the engineer in charge. The plant to be installed immediately on Stave river will have a capacity equal to that of the B.C. Electricity Railway Co. at Lake Buntzen, the one beginning where the other is leaving off. The Canadian General Electric Co., of Toronto, will supply two generators of 16,000 k.w. normal capacity and a 36,000 k.w. transformer, which when in operation will produce about 30,000 h.p. The waterwheels will be supplied by the Escher-Wyss Co., of Switzerland, and the high tension insulators by the Thomas Insulator Co. Other contracts are yet to be let for the steel towers and poles, switchboards, etc.

This company is making no bid for business as yet, but it anticipates little trouble in securing a market for its power once it is available. The present supply of power in New Westminster, Vancouver and surrounding districts is not any more than the demand, so there should be room for another company.

In addition to these projects, the Powell River Paper Co. has started operations for the development of 25,000 h.p. on Powell river. It is proposed to manufacture both paper and pulp there, and it will take two years to put in the requisite machinery. Powell river is located about 100 miles north of Vancouver on the mainland of British Columbia.

INFORMATION

about every conceivable subject finds its way into the newspapers. The function of THE CANADIAN PRESS CLIPPING BUREAU is to collect ALL the items of information appearing in Canadian newspapers about any subject YOU are interested in. Our service is thorough. We don't miss an item. If you want ALL THE CURRENT INFORMATION about a pet subject, we can supply it at the lowest cost. By using our service you can KEEP POSTED on any subject.

CATALOGUES.

HYDRAULIC VALVES AND FITTINGS—is the title of a 120 page illustrated catalogue just issued by the Watson-Stillman Co., 50 Church St., New York. Its pages list a great many types and combinations of hydraulic valves and fittings. Almost every page contains some hint or advice as to the best piping arrangements, what types or combinations of valves are best suited to certain work, how the valves arrangement may operate a number of cylinders or machines automatically, etc. Any engineer will find this book handy when figuring on new hydraulic installations or making changes on old ones. This book will be sent free to any one requesting catalogue No. 78.

SAFETY CUTTER HEAD—J. A. Fay & Egan Co., 362-382 w. Front St., Cincinnati, Ohio, have issued a new catalogue No. 31 which fully describes and illustrates their new Safety Circular Cutter-Head. This machine is described in this issue. Copies of the catalogue may be obtained by writing the J. A. Fay & Egan Co.

VERTICAL BORING MILLS.—Gisholt Machine Company, Madison, Wis., Bulletin. Describes the friction headstock and the lever control of the Gisholt vertical boring mills. The special feature of this device is that the driving mechanism of the table is entirely self-contained in a separate casing, which enables the whole drive to be removed in a short space of time if necessary.

TURBINES.—Kerr Turbine Co., Wellsville, N. Y., have just issued two new bulletins, No. 9, "Turbo-Blower Units," and No. 10, "Steam Turbine Generators, Steam Turbine Centrifugal Pumps." The first bulletin illustrates practical outfits for forced and induced draft, gas works service and for furnishing blast for cupolas. The other bulletin includes generating sets for electric power and lighting, and pumping units for boiler feeding, fire service, water supply, circulating condenser water, draining pumps, and for other service where water must be delivered at moderate or high pressure or against considerable head. Both of these bulletins contain interesting descriptive matter about the construction and operation of Kerr Steam Turbines. The comparisons between turbine and reciprocating engines can profitably be read by all who are in charge of or operate steam power plants. Bulletins will be mailed upon request.

D. C. MOTORS—Phoenix Dynamo Mfg. Co., Bradford, Eng., have issued a bulletin of 40 pages on coated paper giving illustrated descriptions of constant and variable speed motors. These are protected, enclosed, ventilated or rainproof type. Full information in regard to size, price, etc., is included in the catalogue. Catalogue

ELEVATOR CONTROLLERS—In a 128 page booklet just issued by the Cutler-Hammer Mfg. Co., of Milwaukee, the subject of the control of electrically operated elevators is very fully covered. The first section of the booklet contains illustrated descriptions of full magnet and semi-magnet direct current controllers for high speed, moderate speed and slow speed passenger and freight elevators, together with descriptions of sidewalk lift controllers, reversible and non-reversible controllers for belt driven freight elevators, and mechanically operated controllers for use where current conditions are extremely variable. Illustrations and descriptions are also given of such necessary elevator accessories as brake magnets, car switches, limit switches, etc. The second section of the booklet is devoted to similar controllers for use on alternating current circuits and the concluding pages contain tables of useful information, including suggestions regarding the proper type of motor to use in each case.

FURNACES—A neatly printed booklet issued by the Murphy Iron Works, Detroit, Mich., illustrates a large number of instalations and applications of the Murphy furnace. This is issued as a supplement to their complete descriptive catalogue.

BOOK REVIEWS.

ADVERTISING AND ITS SERVICE—In a pamphlet entitled "Advertising and Its Service," the Geo. H. Gibson Co., has reprinted from the New York Evening Post, an article discussing the economic theory of advertising, especially as regards the engineering and mechanical industries. It is shown that, contrary to current academic opinion, properly directed advertising reduces the cost of distribution of goods by providing the salesmen with a greater number of selling opportunities in a given territory and in a given time. It performs the preliminary, but necessary work of informing and educating the prospective user as to the nature, possibilities and profitableness of improved machinery, thereby hastening its adoption. Greater sales, brought about through advertising, usually make possible cheaper production, thereby benefiting the community as a whole, while competitive advertising, which seems to be the especial bugaboo of socialistic writers, is also a benefit insomuch as it stimulates to improvements in the design of apparatus, and advertising is necessary in order that such improvements may meet with a prompt and adequate reward. A secondary benefit is derived from the fact that a consistent policy of advertising lessens the capital risk when new enterprises are undertaken and insures permanency to a business. In other words, advertising does not become an added burden on the consumer. Copies of this pamphlet may be had from the Geo. H. Gibson Co., Advertising Engineers, Tribune Building, New York City.

METAL STATISTICS.—The American Metal Market Co., New York, have published a little book, 1910 Metal Statistics, which is a mine of information regarding metals, their prices, production, etc., during the past decade. The present edition embraces a number of new features and the old ones have been more or less improved. The iron and steel section has been enlarged, and improvement is noted in the tables devoted to iron ore, pig iron and iron and steel products generally. The other metals are dealt with very fully, but in a concise form. The book of statistics is worthy a prominent place in the reference file.

GAS, GASOLINE AND OIL ENGINES.—By Gardner D. Hiscox, M.E. Size, 6 x 9½ in.; pages, 484; illustrations, 410. Bound in cloth. Price, $2.50 net. Published by the Norman W. Henley Publishing Company, 132 Nassau Street, New York City.

The eighteenth edition of this practical work treats of the entire field of the explosive motor and its applications. This new edition has been revised and enlarged to bring it up to date by adding material that represents the latest standards of construction and operation of this type of motor and the production and uses of producer, suction blast furnace and coke oven gases. These gases are now coming to the front as sources of the economical development of power on a large scale and are being used more and more extensively each succeeding year.

Crude petroleum, which has an increasing sphere of usefulness as the cheapest power fuel where the erection of gas plants is not convenient, comes in for a share of attention and the methods of converting it into power fuel are illustrated and described.

The rules of the National Board of Fire Underwritesr regarding the installation and management of gasoline motors and the location and management of producer gas plants, with the

special rules of the New York Board for gasoline engines installed in that city are given in full.

In the application of gas and gasoline engines to marine use a number of changes have been made during the last two years and are included in the book. Some of these have been in the nature of improved patterns of existing types, while others were entirely new designs. For farm and suburban use the internal combustion engine has almost entirely superseded the windmill, and it is being employed very extensively to drive portable machinery in place of the electric motor.

A list of patents issued by the United States Patent Office covering gas, gasoline and oil engines and their accessories from 1875 to October, 1909, is also included in the book.

FUEL TESTS WITH HOUSE-HEATING BOILERS—By J. M. Snodgrass, is issued by the Engineering Experiment Station of the University of Illinois as Bulletin No. 31. It reports 130 tests of anthracite, Pocahontas coal, coke and Illinois coal made in connection with two types of house-heating boilers. Copies may be obtained gratis upon application to W. F. M. Goss, Director of the Engineering Experiment Station, University of Illinois, Urbana, Illinois.

THE OCCLUDED GASES IN COAL.—By S. W. Parr and Perry Barker, issued as Bulletin 32 of the Engineering Experiment Station of the University of Illinois, is essentially a study of the behavior of coal towards the atmosphere. The avidity of coal for oxygen is made evident, and the results of the entire work bear directly upon the matter of weathering and of spontaneous combustion. Copies of bulletin No. 32 may be obtained gratis upon application to W. F. M. Goss, Director of the Engineering Experiment Station, University of Illinois, Urbana, Illinois.

TESTS OF TUNGSTEN LAMPS.—By T. H. Amrine and A. Guell, issued as Bulletin No. 33 of the Engineering Experiment Station of the University of Illinois. It reports a series of tests upon tungsten lamps of the 25-watt size, with filaments made by the paste, colloid and deposition processes. Copies of Bulletin No. 33 may be obtained gratis upon application to W. F. M. Goss, Director of the Engineering Experiment Station, University of Illinois, Urbana, Illinois.

The Skinner Chuck Co., New Britain, Conn., gave a dinner to their employes on Dec. 28. The menu cards were very artistic and contained a litho of D. N. Camp, president. Sec'y E. J.

ERNEST SCOTT

Machinist and Tool-maker
Dies for sheet metal work. Stampings and light manufacturing. Special machinery designed and made to order.

NOTICE TO SUBSCRIBERS

Subscribers will confer a favor on us by notifying us in case they are not receiving their paper regularly, or if they find they have missed one or more issues. We send out thousands of copies each month, and it is only natural to suppose that a few copies will go astray in the mails, even though every precaution is taken by us to avoid this.

We should also be notified at once of any change of address, giving both old and new addresses.

The Art of Welding Metals

The use of the ***Oxy-acetylene blow-pipe*** in welding has greatly extended the field in this class of work.

Simple or complicated fractures and breaks in all kinds of machinery may be repaired and made almost equal to new in strength and appearance; the broken edges of iron, steel, aluminum and other metals are melted together with the addition of more metal under a temperature of 6,000 to 7,000 degrees Fahrenheit.

This plan is much superior to brazing or riveting and may be used for an infinite variety of new and repair work hitherto done by less efficient methods.

We have installed a plant for the purpose of welding by this process, and shall be glad to send particulars and quote prices.

Enquiries and correspondence solicited.

CHAS. POTTER,
85 YONGE ST., TORONTO

THIS SENSITIVE BENCH DRILL

WILL PROVE A MONEY-SAVER IN YOUR SHOP

It is the handiest bench drill on the market for rapid drilling up to 5-16 of an inch. The spindle has two speeds and is driven by a one-inch flat belt. It is entirely relieved of belt strain; is counterbalanced by a weight inside of the frame, and is provided with the means for taking up wear.

This machine will last a long time and stand a lot of wear, as only the highest grade material is used in its construction.

A Postal will bring Prices and Circular.

PACKING FOR VALVES.

Frothingham & Workman, Montreal, have been appointed agents for the Federal Metallic Packing Company, Boston, who manufacture a number of packing lines. The Pactite brand, made from the finest alloy of Antifriction metal, is the most serviceable, and is used for packing of all kinds of stationary joints, valves, etc. It is flexible, compressible and lubricated, stands any degree of temperature or pressure and does not injure a rod of any kind. The method of fibering metal to be woven into a packing was originated by the Federal Metallic Packing Company. The construction of the various packings of the company gives the impression that all are alike, and yet this is only true in appearance as there are many different cores and inside binders which are always effective in the stuffing boxes for which they are intended.

MACHINISTS' ATTENTION!

MACHINIST'S TOOL-CASE FREE to one man in every shop. Address, with stamp, O. BURCH, Grand Rapids. Mich. (3)

BUSINESS OPPORTUNITY.

A PARTY holding a large interest in a well-established prosperous machinery manufacturing company on the Pacific coast, wishes to dispose of part of his holdings to meet personal obligations. Can arrange if necessary for purchaser with proper qualifications to take an active part in the management. This is a splendid opportunity and investment for anyone wishing to get a start in a good, steady, legitimate, profitable business, in a young, growing country. Applicants who mean business, must have at least $20,000, are invited to investigate. Write Box 102, CANADIAN MACHINERY, Toronto. (4)

STEAM PLANTS IN SILVER MINES.

The extent of mining development going on in the new silver camps of northern Ontario is set forth in a table just published, showing the new steam plants in operation, their locality and capacity. The list as published is as follows:—

	Boilers H.P.	Compressor Capacity Cubic feet free air per min.
Elk Lake District.		
Ribble Property	95	410
Diabase Mining Co.	30	—
Gavin Hamilton	80	410
Bix Six	100	410
Cummings	100	330
Elk Lake Discovery	110	585
Moose Horn	120	330
Elk Lake Cobalt	100	585
Toledo Silver	60	330
Otisse	160	825
North American	30	
Silver Lake	20	
Otisse Currie	90	825
Big Six	80	823
Blackburn	120	660
Bonsail	100	330
Bartlett	160	1160
Boyd Gordon	100	585

While the list is the most complete yet published, it does not include steam plants on the Reeve-Dobie and Mann at Gowganda, and the Silver Tunnel at Silver Lake. At Maple Mountain the White Syndicate have a plant in operation. In the Anima-Nipissing belt, west of Latchford, a Buffalo syndicate has a steam plant at work. Several mines in South Lorain, including the Keeley and Wetlauffer, have steam plants and compressors.

The impressive fact is that hundreds of thousands of dollars are being invested in mining development, that thousands of men are finding steady work at good wages, and that men who are spending their time and money have found that their industry will be rewarded.

YOU CAN DISPLAY YOUR GOODS TO BETTER ADVANTAGE through the use of up-to-date fixtures. We are specialists in the planning of stores and offices. Our catalogue contains illustrations of many new features and several handsomely equipped stores and offices. Shall we send you our catalogue J? Jones Bros. & Co., Ltd, 30-32 Adelaide St. West, Toronto. (tf)

SITUATIONS VACANT.

WANTED.—First-class A1 salesman, for a well established Toronto firm, dealing in engineering, electrical and mill supplies. Man must be familiar with office routine and management, and have sufficient executive ability to eventually take the position of sales manager. State age, experience and salary expected. Apply Box 97, Canadian Machinery, 10 Front St. East, Toronto. (2)

WANTED.—Energetic and experienced man to take charge of machine shop and blacksmith shop with about sixty hands, connected with large manufacturing concern. Man wanted with good knowledge of modern methods, and capable of handling men. Apply, with references and particulars regarding experience, stating age, and wages expected. Address, Box 99, c/o Canadian Machinery and Manufacturing News, Toronto. (1)

WANTED—Working foundry foreman for small foundry in a nearby city; one familiar with general jobbing work and who can handle men. A good job for the right man. Address Box 103, c/o CANADIAN MACHINERY, Toronto. (3)

From Editor to Readers

WE wish to take the readers of Canadian Machinery into our confidence, and we want to be taken into your confidence so that Canadian Machinery may be of most use to you. We want you to "get the habit" of writing us for information, giving criticisms and suggestions, etc. If you desire the address of the manufacturer of any class of machine shop or foundry equipment, we will supply you with the information if you mail us a card containing your request.

What would you think of a manufacturer, superintendent or foreman who was content to do things the way his grandfather did, when his competitor kept his shop up to modern requirements and is able to place his products on the market at a less cost than the first mentioned?

Almost every day new methods and machines are being devised and designed for doing work and the one who follows his paper is the one who can manufacture at the lowest cost.

Technical Education.

A topic that is receiving the attention of manufacturers, employes, and governments all over Canada. We have arranged for a number of articles on this subject discussing the question from a practical standpoint, and giving descriptions of systems now in successful operation.

Methods and Devices.

Requests have been received for the enlarging of our "Method and Device" department. With this in view we have devoted two special articles to this subject, giving a number of devices for railroad and general machine shop work, which should appeal to the reader.

In the West Indies.

David Williams, formerly a manufacturer of Collingwood, Ont., but now on the circulation staff of the MacLean newspapers, is working in the West Indies. From Bermuda he writes:

"Canadian Machinery takes well and we are building up a good list here. I expect that our local agent will secure the mechanical men in the smaller places where I may not visit before leaving the Bahamas." We are covering all Canada just as thoroughly as we are doing the West Indies.

Know Your Costs.

For some time we have had in preparation articles on practical cost systems, a number of which are in successful operation. These will appear in succeeding issues. There are manufacturers who are practically in no better circumstances than they were years ago because they do not know their costs. Every manufacturer should be intimately acquainted with the costs of production.

The Foundry Department.

Beginning with the April issue we will give descriptions of exhibits, etc., that visiting foundrymen will see at the annual convention of the A.F.A. in Detroit, June 6. Every foundryman should make arrangements to visit Detroit during the convention week.

¶ **Remember**— That Canadian Machinery will keep you posted on all subjects relating to Machine Shop and Foundry Practice. The development in machine tools, and the evolution of the machine shop can only be kept pace with by perusing each month your technical paper.

Greening's WIRE ROPE

DON'T RUN RISKS

¶ Different purposes require ropes of varying constructions and qualities. Your best policy is to buy your ropes from experts, stating conditions under which the rope is to be operated. Greening's Wire Rope is the best on the market. Made from wire specially imported from the world's best producers of wire for rope making. All wire used in Greening Ropes is subjected to a complete set of the severest tests before being made into rope. You may rely upon it absolutely.

ONTARIO WIND ENGINE & PUMP CO., Limited
TORONTO and WINNIPEG

The Robeson Process Co. takes pleasure in announcing to the foundrymen of Canada that it has begun, at Grand Mere, P. Q., under Canadian patent No. 110049, the manufacture of glutrin, that cheapest and best of all sand binders, and that

Francis Hyde & Co.

31 Wellington Street,
MONTREAL, P. Q.

are selling agents.

The Man Behind the Cheque

If you are making machinery castings, you are likewise signing many cheques.

You will sign fewer, and a lesser aggregate will flow out from your bank balance if you use **STEVENS' STOPPER**, for "stopping" the holes and smoothing over the rough surfaces of your castings, It is a steel cement, and when you fill a hole with it, the hole is lost to sight and memory.

It costs less than any on the market. One manufacturer of castings uses five hundred pounds every month, at twenty-five cents per pound. No; I won't say who it is.

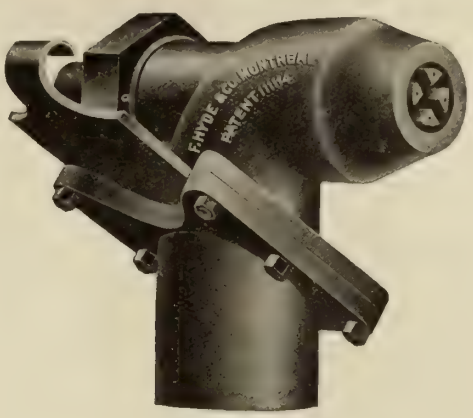
If it is not satisfactory, you do not have to pay for it.

I manufaoture FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES.

FREDERIC B. STEVENS

Export Warehouse—Windsor, Ont. - Main Office—Detroit, Michigan

The Vital Part of an Oil Furnace Is the Burner



Style No. B 1 A
Low Pressure Burner

THE JACOBS BURNER

is one of the many features that has gone to make

The King Oil Fuel Furnace

the leader. It is one of the reasons why we are being crowded for deliveries.

The Best and Most Economical

BECAUSE it does not require either compressed air or fan blast for proper atomization and combustion.

It can be operated by fan blast, compressed air or steam.

It has fewer parts, is more easily adjusted and cannot get out of order.

A perfect admixture of air and oil is assured by the simple and effective manner of controlling same.

TRENTON, N. J., U. S. A.

MANUFACTURERS OF

Crucibles of Quality

EUREKA BLACKING

As a core wash our **EUREKA BLACKING** will do something not done by anything else on the market.

When applied to a core and dried it will not rub off. Does it not naturally follow that if it will do this, it will not run before the metal, consequently the sand will peel off clean? This means a considerable saving in your cleaning room.

If you use Plumbago for core wash you are spending two or three times too much and not getting as good results as you should and could with **EUREKA BLACKING.**

A barrel on trial; if not satisfactory return at our expense.

Dominion
Foundry
Supply Company
Limited
Montreal-Toronto

"Everything you need in your Foundry."

SUPPLIES

"MORSE" REAMERS

are furnished in several styles and adapted for every kind of service from that which is roughest, as in Boiler, Bridge and Structural Iron Work to that which is finest, as in high-class Machine and Tool Work.

May we not send you our catalogue? In it we illustrate our various Reamers, Drills, Cutters, Chucks, Taps, Machines and many other tools.

OUR GOODS ARE HANDLED BY

Rice Lewis & Son, Limited, Toronto. Aikenhead Hardware, Limited, Toronto. Frothingham & Workman, Montreal. Mechanics Supply Co., Quebec.

Morse Twist Drill & Machine Co., - New Bedford, Mass., U.S.A.

WHY PAY FANCY PRICES FOR NEW HIGH SPEED STEELS?

Beardshaw's "Conqueror" Brand

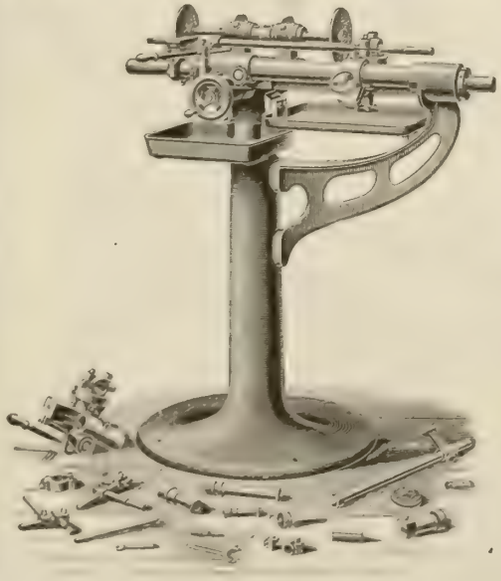
WILL MEET ALL REQUIREMENTS AND SAVE YOU MONEY AS WELL

Get Our Prices For "Conqueror" High Speed Drills

SELLING AGENT **ALEXANDER GIBB** 13 St. John Street MONTREAL

Cutters and Reamers deteriorate rapidly if they are not kept ground.

No. 3 Cutter and Reamer Grinding Machine



can be used to sharpen a large range of these tools.

The machines are economical in operation even if only a small amount of work is to be done.

All of the parts shown in the cut, together with the overhead works, are furnished with the machine and make it possible to cover a wide range of work.

HARBISON-WALKER

The Standard of Quality

FIRE BRICK FOR CUPOLA LININGS

Do you figure *prices* per thousand brick or fire brick *costs* per ton of iron melted?

If the latter, we can help you. Our foundry records show it. Let us take it up with you. Quality tells.

BOILER SETTINGS

The grade that practically insures your settings when running overload, whether hand fired or mechanically stoked.

Your request will bring Catalog and full information.

HARBISON-WALKER REFRACTORIES CO.

Pittsburgh - - - Penna.

USE

BASSITE

As a substitute for Tin in your brass castings.

WHY?—

A pound of Bassite will solidify a greater proportion of copper than one pound of tin.

It makes castings cheaper, cleaner and tighter than is possible with tin. Will not burn in the sand.

Bassite is not a theory—not an experiment.
It is a practical success—Tried and Proven.
Does this difference in cost interest you?

Tin at 32½c. per lb. Quantity one ton, Total....$650.00
Bassite at 20c. per lb. Quantity one ton, Total....400.00
Actual saving in cost per ton being.....$250.00

Send us your trial order. No pay if unsatisfactory. Bassite will do just what we claim for it and we will stand back of our proposition to you. Try us.

is, as its name signifies, a company with works situated at Levis, Quebec, manufacturing every machine required in the Shoe Making Trade, and also carrying on a large business as general engineers and machinists. The present works, originally occupied by Carrier, Laine & Company, were taken over last spring and since then several large contracts, including the engine and boilers of the Quebec & Levis Co., have been carried out most successfully.

The different Machine Shops, Foundry and Boiler Shops, are spacious and fitted with the most up-to-date plant for the rapid handling of the largest pieces. Mr. Ernest Caron of Quebec is the energetic and capable manager, and already a flourishing market has been opened in Great Britain and Europe for the firm's Shoe Machinery, where it is handled by leading firms in the trade.

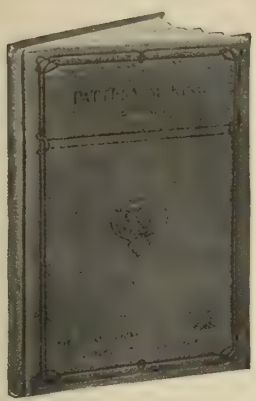
YOU MAY HAVE ONE OF THESE TECHNICAL BOOKS WITHOUT SPENDING A CENT

if you are a subscriber to "Canadian Machinery," by sending in to us the specified number of new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.



Pattern Making

By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

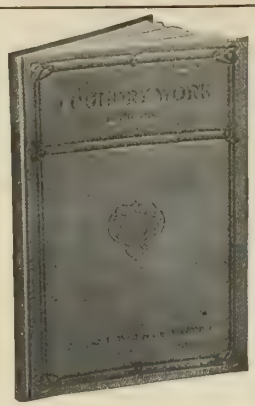
Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

Published Monthly at **$1.00** per year. **Address Subscription Dept.**

LONDON, CANADA

DO YOUR BELTS STRETCH?

We can just hear you say:—"Of course, **all** belts stretch." We will admit that if you don't specify the amount of stretch. We will **not** admit there are any leather belts that stretch less than ours.

Our Belts Stretch Less (by 15% to 25%) Than Any Others

Why? **Because** we take more care in stretching before the belt is made up.
Because none of the unstretched parts are used in the make up.
Because other makers smooth out this unstretched part and use it in their belts, and when the load comes on **that part is bound to stretch.**

Why pay for a lot of belting you have to throw away in little bits at a time, to say nothing of time lost in taking up slack?

Specify **"Extra," "Standard"** or **"Acme Waterproof"** and get prices from

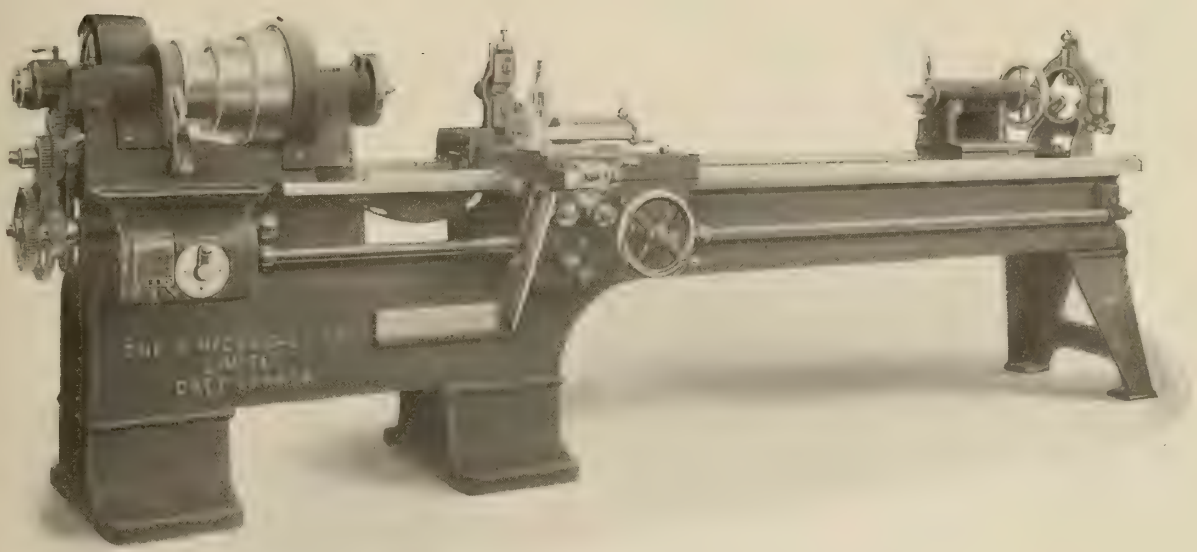
MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines



GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

LABOUR-SAVING MACHINE TOOLS

MANUFACTURED BY ALFRED HERBERT, LTD., COVENTRY ENG.

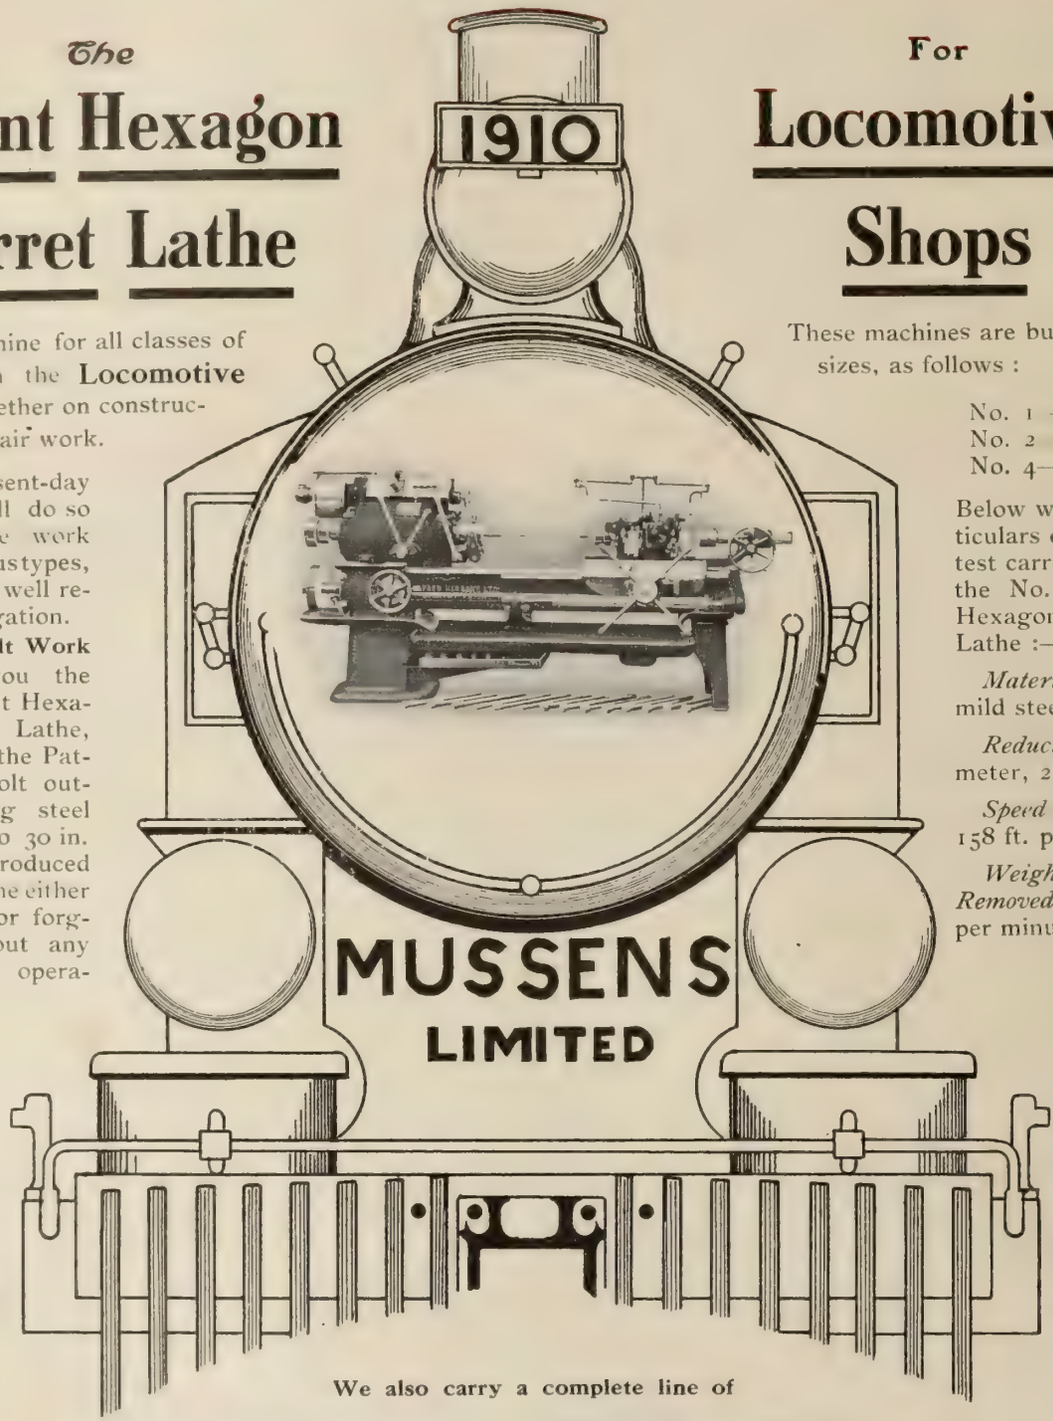
The

Patent Hexagon Turret Lathe

is the machine for all classes of bar work in the **Locomotive Shops,** whether on construction or repair work.

The present-day machine will do so much more work than previous types, that it will well repay investigation.

On Stay Bolt Work we offer you the No. 2 Patent Hexagon Turret Lathe, fitted with the Patent Stay Bolt outfit, enabling steel stays up to 30 in. long to be produced in record time either from bars or forgings without any subsequent operations.



For

Locomotive Shops

These machines are built in three sizes, as follows :

No. 1 — 1½" x 21"
No. 2 — 2¼" x 30"
No. 4—3½" x 42"

Below we give particulars of a recent test carried out on the No. 2 Patent Hexagon Turret Lathe :—

Material—30-ton mild steel.

Reduction in diameter, 2" to ¾".

Speed of Work 158 ft. per minute.

Weight of Metal Removed—7¾ lbs. per minute.

FULL PARTICULARS FREE ON REQUEST

We will be pleased to give a guarantee of output on receipt of samples or sketches

We also carry a complete line of

Two Leaders In Small Tools

That Cut Down Drilling and Reaming Costs

The P. & W. "Highpower" Twisted Drill

(Patented July 14. 1908)

The strongest long-lived drill on the market.

Requires no special drive.

Fits any standard taper socket.

Runs as true and drills as accurately as a milled drill.

Can be "crowded" in heavy drilling until machine stops for lack of power to drive drill.

The P. & W. Adjustable Blade Reamer

(Patented Dec. 22, 1903)

The dependable reamer that IS exact, can be KEPT exact, and that will LAST a lifetime.

Eccentrically relieved and can be set to size without regrinding.

Easily and quickly taken down to replace broken blades, and readily reset to exact size.

Projecting blades used for facing holes at bottom.

A PLANER WITH A SPEED VARIATION 10/180 FEET PER MINUTE

Has it ever occured to you that your planer might do a lot more work than it does, that it is expensive to run, its upkeeping in belts is higher than in any other machine because it wastes power in stopping and re-starting in the opposite direction at the end of every stroke? That if a belt breaks, the table will run off and do a lot of damage? That you ruin a lot of tools because you cannot run it slow enough when cutting a hard piece of cast steel, or waste time because you cannot run it fast enough when cutting a soft piece of brass? That you cannot rely on it stopping at exactly the same place every time and thus break tools if you are planing a dead-ended slot?

We are not selling planing machines, but we have an electrical drive which we can fit to your present planer or to your new one, which it will pay you to investigate. The "Lancashire" Planer Drive is fool-proof, and will enable you to increase your return strokes' speed to at least 180 ft. per minute with a table weighing 12 tons, and give you a speed variation of from 10 to 180 ft. per minute on your cutting stroke by simply turning the speed regulator handle to the speed you want. Furthermore, it stores up the energy generally wasted in stopping and reversing the table, and uses it during the next stroke. The table will stop at exactly the same spot, and there is no possibility of it running off under any circumstances. It is not like the old type of electrical planer drives with a 3 to 1 speed variation and with an expensive set of controller contacts to renew every six months. The "Lancashire" system is good for either direct or alternating current, has standard speed variation of 18 to 1 and will not cost you 50c. a year in renewals.

28″ Swing Double Back Geared

This Barrel Leaks Your Money

¶ Every wooden shop barrel you have is leaking away your money. You are paying more than you used to for wooden barrels — but even when you bought them cheapest you were really losing money that you might have saved with our STEEL SHOP BARRELS.

¶ Steel Shop Barrels you'd need, cost just about what you would pay for wooden barrels used during a year. But the second and third, and maybe other, years you would buy no barrels at all. That looks like 100% a year saving, doesn't it?

¶ Besides, our Steel Shop Barrels are easier to handle, take up less room, look better, and don't fall apart when you are not expecting it or any other time.

¶ Even a small shop can save hundreds of dollars a year with our Steel Shop Barrels, Boxes, and other money-saving things for factories.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills, Dust Arresters, Sand Blast and Foundry Equipment.

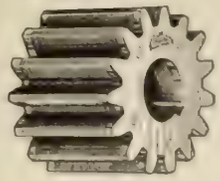
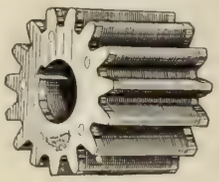
NEW PROCESS RAWHIDE GEARS WEAR LIKE IRON



This means durability too, for New Process Pinions are iron tough and iron hard — like iron but without the metallic noise.

New Process Pinions, being silent, remove the last objection to positive motor drive. Further, there is just enough spring to the teeth to cushion each contact and do away with vibration. Remember this when you contemplate installing motors. Rawhide gearing is the only means of securing the quiet of a belt drive with the higher efficiency of gearing.



Tell us the size of your noisiest gear and we will quote special price for a trial on one drive. Ask for our booklet "Noiseless Gears."

Automatic Forging Drop 3,000-lb. Hammer

FOR THE FORGE SHOP

Automatic Board Lift Drop Hammers
Hot Trimming Presses with Side Shear

The endurance and effectiveness of Automatic Drops depend in no small degree on a proper ratio between the weight of the base and the weight of the hammer. The additional cost with all parts made of proper proportions is more than compensated for by the larger quantity and better quality of the finished product, and by the comparative freedom from breakdowns obtained from their use.

The hammers are made of steel forgings. The bases are cast in a single piece.

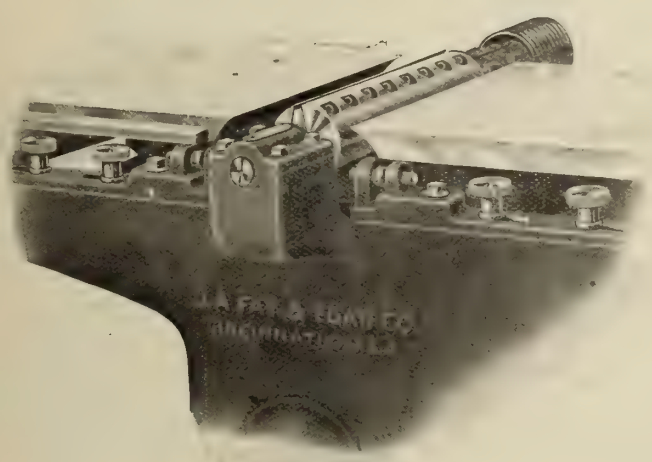
A New Circular Cutter Head



THIS ILLUSTRATION is a section taken from the **J. A. FAY & EGAN CO.'S** No. 61 C Hand Planer and Jointer, with the tables drawn back, giving the reader an idea of their New Safety Circular Cutter Head.

This new Cutter Head closely fills the opening between the tables, so that the most severe accident that could possibly happen would be the scraping of a finger or thumb.

The design is such that the cutting edges of the knives protrude but slightly from the circumference of the cylindrical-shaped head, and thus permit the tables to be set very close to the cutter.

You are requested to write the Manufacturers for their new Catalog No. 81, which illustrates and describes their New Safety Circular Cutter-Head in full

A Speed Variation of 18 to 1 on Motor Driven Planer

The Lancashire Dynamo and Motor Co. Have Recently Introduced an Electrical Drive, giving Remarkable Speed Variation of 18 to 1—The Accuracy Obtainable in Reversal by this System is fully Described and Illustrated.

The electrical driving of planing machines is a matter that has had a good deal of attention in an endeavor to eliminate the defects of mechanical reversing gear.

The objects to be obtained are: (1) Simplicity and reliability; (2) Some method of recovering the energy imparted to the table, particularly during the return stroke; (3) A large range of speed; (4) A method applicable to both direct and alternating systems.

A Unique Method.

In the following system known as the "Lancashire" system, these results are obtained in a very high degree, and the system provides an extremely flexible drive for this class of machine. The shaft that operates either the screw or the rack of the planer is connected direct to a motor, the motor itself reversing at the end of each stroke. This motor has its direction of rotation controled by a small high-speed motor generator set the motor of which is driven off the mains, by either alternating or direct current.

The armature circuit of the planer motor is not broken at all, the reversals being effected by reversing the polarity of the generator of the motor generator set, which is done by reversing the field connections. This means that the reversing switch instead of dealing with the full current required to drive the planer only deals with a few amperes, and the switch therefor can be made very light and yet strong. The whole of the mechanism for reversing is merely a two pole two-way switch actuated by the stops on the table. The makers claim that this method of reversal eliminates the rather expensive controller renewals generally required with systems in which the armature current is reversed. A separate small switch is provided to stop and start the planer, or in the case of large tools, two are provided one on each side of the machine.

18 to 1 Speed Variation.

The range of speed is really only limited by the maximum speed at which a table can be returned. As this is usually about 180 or 200. feet per min., the usual range of speed supplied is 18-1, that is, with a planer that returns at 180 feet per minute, there are provided about 30 steps on the cutting stroke the lowest being ten ft. per min. and the highest 180. These very low speeds are very useful in setting large jobs and in taking rough cuts off castings with scale on them.

The motor works at rather less efficiency at the lower speeds, but as the control is not by armature resistance the loss is not material. Two of the cuts show a 18 ft. x 6 ft. x 6 ft. planer which, with a total load of eleven tons, is provided with a cutting speed of from 5-180 feet per minute and a return speed of 180 feet.

Conservation of Energy.

One of the great features of the system is that the energy imparted to the table during acceleration is not lost in heating belts, clutches or resistances, but is partly returned to the mains, (the motor acting as a generator) and is partly stored up by raising the speed of the motor generator set, to be used again to accelerate the table quickly without drawing an excess of current from the line.

The power curve of a planer equipped with the system is shown herewith, Fig. 3, and this shows clearly the current returned to the line, and the absence of a large peak, during the accelerating period, notwithstanding the high speed that the planer was run at.

Planing to a Line.

This method of storing the energy has also the advantage that it causes the table to stop at exactly the same spot every time, owing to the fact that the braking effort is always constant, and is not dependent on any mechanical contrivance that may vary in strength through damp or heating. A photo-

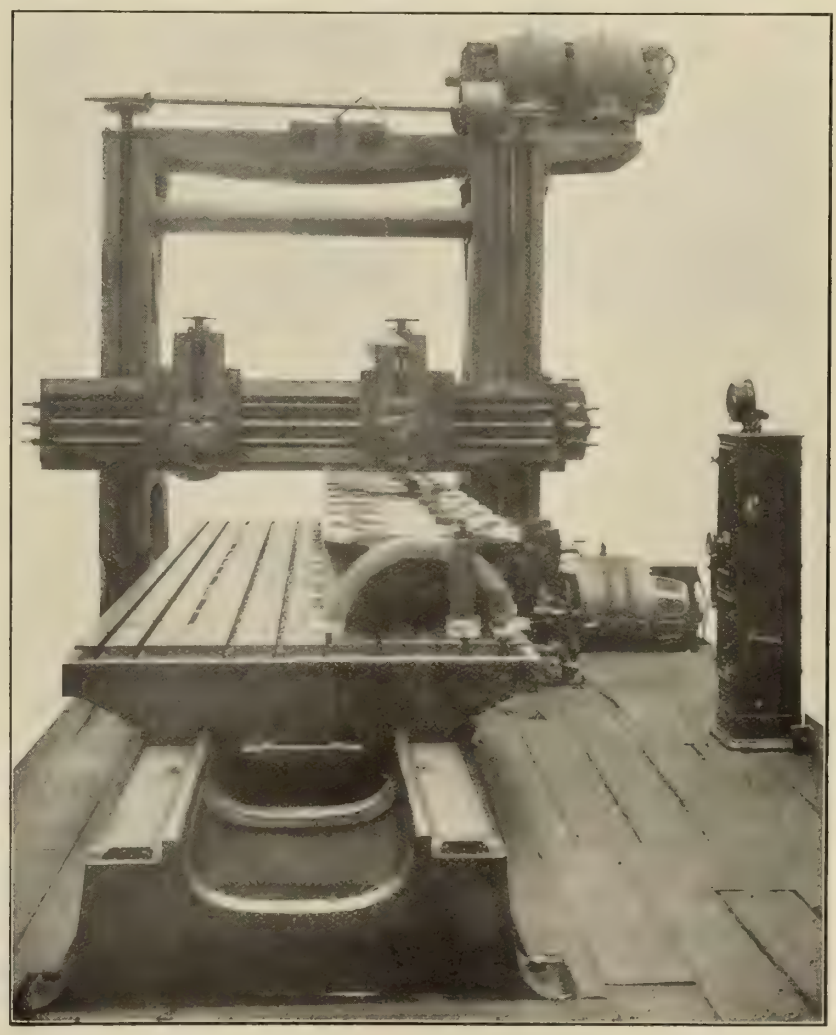

Fig. 1.—Planing Machine Equipped With Lancashire Electric Drive.

graph of the cuts made in a block by two planers is here shown. Fig. 4 shows the cuts made by a modern belt driven planer, cutting at 54 feet per minute and returning at 150 feet. Fig. 5 shows the cuts made by a larger planer converted to the electrical drive when cutting at 60 feet and returning at 180 feet. In the latter case the planer table comes true to the same mark at the end of every stroke.

Adaptability.

The system is very easy to adapt to existing planers, and the smoothness of the reversal enables the speeds to be

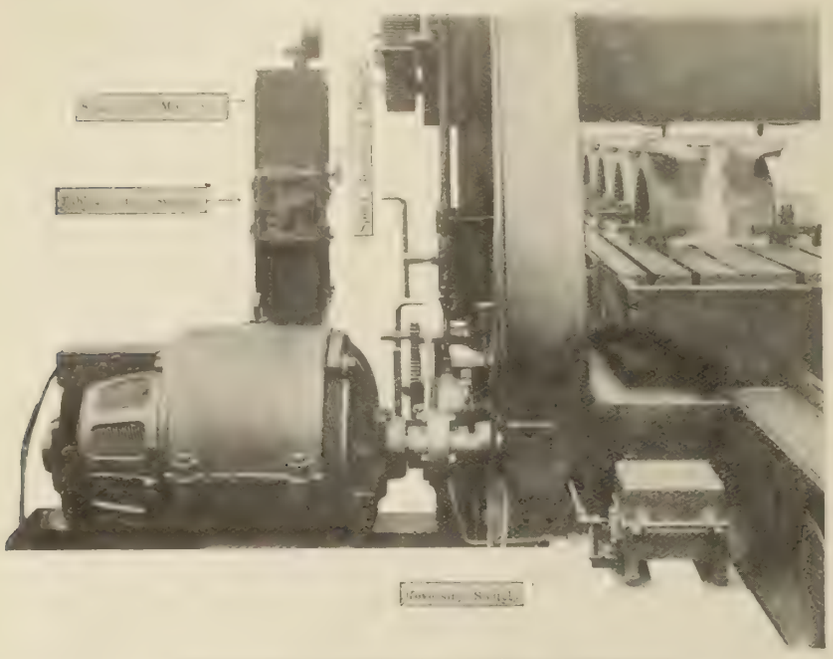

Fig. 2. The "Lancashire" Drive, showing Table Control.

materially increased, and with the large speed variation given one can always have the machine cutting just as fast as each job will stand, as of course to alter the speed is only a matter of turning the speed regulator to the speed required. As the motion of the reversing switch is a simple to and fro motion, and the speed of the movement is immaterial, it is adaptable to any existing belt shifter.

Foolproof.

The makers state that, provided the table has stops on it, it is absolutely impossible to cause the table to run off, under any circumstances, short of breakage. If the supply of current fails, the planer runs until the energy in the moving parts is expended, but if the supply fails when the motor is just on the point of reversal, the motor still reverses. This is a very important point, as with some drives, if the power fails, the motor will not reverse, but allows the table to run off. If any of the contacts in the reversing switch failed to make contact the table will pull up in about eight inches, even when running at 180 feet per minute, and with a table load of ten tons.

The originators and makers of this gear are the Lancashire Dynamo and Motor Co., Ltd., 152-154 Bay Street, Toronto. They do not make planing machines, but supply all the electrical gear for the drive.

DRY VERSUS WET TOOL GRINDING.

Users of tool grinders are leaning toward dry grinding for the general purposes of the machine shop, not because the results are better, but because with the wet process the average workman places altogether too much reliance upon the cooling influence of the water. He presumes that the cooling agent is able to carry away the heat generated by the contact of the steel and wheel, no matter how severe that contact may be, and the ruin of the tool may result. With dry grinding greater care must necessarily be taken. Of course in works where much of the tool sharpening is done by the toolroom, experts are employed, and the wet grinding is often preferred, for obvious reasons.

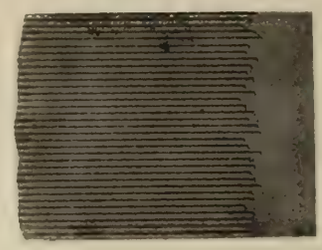

Fig. 4.—Block Planed on Planer Before Equipped With Lancashire Drive.

A series of tests made in the course of research into the characteristics of the high-speed steels developed the fact that the failure of tools made of such a steel to accomplish a good finish on

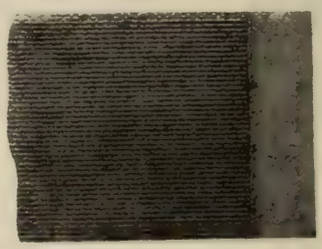

Fig. 5.—Block Planed With Lancashire Drive.

work is due to unskilful grinding. Even under a copious stream of cold water the tool becomes red at the surface. So great a degree of heat cannot be diffused rapidly enough, and inner stresses occur. The fineness of the cutting edge quickly breaks down under use. The tool loses nothing in its capacity for roughing, but it lacks the edge requisite for a finishing chip. A remedy is to

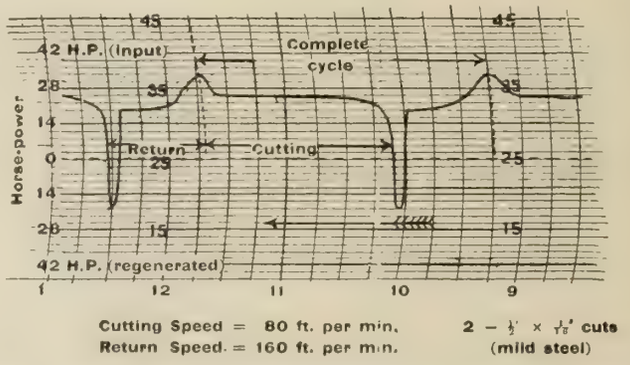

Fig. 3.—Power Curve of Electric Drive on the Lancashire System.

grind the tool hot. In the tests alluded to an extreme fineness of work was procured by this process, and equally good results were obtained when sufficient care was taken in grinding cold.—Iron Age.

A Group of Grand Trunk Railway Apprentices in the Montreal Shops.

How the G.T.R. has Solved the Apprenticeship Question

Canadian Railroads are in Need of Trained Mechanics; to Supply the Demand they have Successfully Devised and Carried out a System for Training Good Mechanics—This Article deals with the G.T.R. System.

With the idea of training intelligent mechanics, the Grand Trunk Railway several years ago started a class for its apprentice boys, who were eager to learn; commenced to teach subjects which at once aroused interest among the boys, bearing as it did on the every-day needs of mechanics. In a surprisingly short time, the desire for knowledge being whetted, it was found necessary to increase the scope of the teaching, as the apprentice boy of the day saw within his grasp the very highest position of responsibility in the management and operation of the road. He realized that here was an opportunity to obtain an education little short of a college course, with a minimum exertion on his part and at the same time be independent and self-supporting.

From the commencement on a small scale, the system has grown until at the present time these technical schools are spread at all important centres throughout the entire Grand Trunk System and hundreds of scholars are enrolled, whilst every large railway system of this continent boasts several graduates af the G. T. training schools as their chief mechanical engineers, and more than one of our largest industrial concerns have graduates as their chief draughtsmen.

The subjects taught are graded to suit the student's ability and in dozens of cases boys who left school when in the second book can now do problems which would tax the powers of a High School graduate to the utmost.

The subjects taught comprise everything from simple arithmetic to higher mathematics, mechanics, machine design and mechanical drawing, and so well has the course been graded that numerous requests from mechanics' institutes and even our largest technical colleges have been received for complete sets of instruction books.

The entire cost of education at these training schools is borne by the Grand Trunk System, who furnish all the equipments and engage the instructors, who must themselves have had a thorough technical and practical training, so as to enable them to anticipate the needs of the apprentices.

The appreciation of individual promotions forms one of the strongest features in the system and serves to keep alive the keenest interest in the classes, as the boys realize that as soon as they arrive at a certain standard of excellence, increased pay is their reward, and many of our foremost students of political economy, see in this system, as it is being carried out, the future supply of skilled mechanics, master mechanics, superintendents, etc., being carefully husbanded, and an effective solution to labor problem, namely, the prompt recognition of individual merit.

Night Classes in Drawing and Mechanics.

For two evenings per week during the fall and winter months he must attend mechanical drawing classes, study of practical mechanics and elementary electricity, the most competent instructors procurable being provided. On the staff are two graduates of American and Canadian engineering colleges, Purdue and McGill. The work in the drawing class is outlined in a special text book written by the company's Chief Draughtsman at Montreal, who is also the author of the book used on practical mechanics.

During the term frequent examinations are held, and the points gained by each boy are posted so that they may all keep advised as to just what progress they are making, and thereby be able to brush up the weak spots that the examinations have disclosed.

The master mechanic is constantly in touch with each boy's progress and standing, and if necessary he frequently calls a boy up, and in a kindly manner points out to him the necessity of applying himself more consistently to bring his rating up to the required standard.

Prizes for Best Work.

The annual competitive examination is always conducted by the company's chief draughtsman from Montreal, and has just been completed at all the large shops along the system. Prizes are awarded to the apprentices obtaining the highest average in their respective years. These prizes amount to $40.00 for each shop, and are distributed over the different years of apprenticeship, thus : the apprentice obtaining the highest average for his first year in mechanical drawing gets $4.00, and the one obtaining the highest in practical mechanics gets $4 also. Therefore, it is quite possible for one apprentice to ob tain both prizes. A keen interest is taken in this examination, which takes the form of a contest between the various shops.

In addition to the prizes as stated above there is a capital prize offered of $25 for each subject. This is competed for by the apprentices obtaining the highest averages in drawing and practical mechanics at their respective sta tions. These apprentices are given a trip to some point on the system where the final examinations are held, and the one receiving the highest number of points in each subject receives the amount stated. This, in addition to what he has already received at his station, will make a tatal of $29, $33 or $58, if he has been successful in all subjects.

The form of apprenticeship which has been adopted by the Grand Trunk Rail way System has been in successful operation for a number of years and has been the means of supplying that company with skilled mechanics in the most satisfactory manner. All apprentices are indentured to machinist's trade for five years, and to blacksmith's, boilermaker's, or other trades for four years. Five cents per day is deducted from the wages of each apprentice, and the total amount is returned to him at the expiration of his apprenticeship with an addition of $25 as a bonus if services have been entirely satisfactory.

G. T. R. Apprentices at Work on a Rebuilt Locomotive in Stratford Shops.

The first requisite in employing an apprentice is to know that he is morally, physically and mentally capable of filling the requirements of a mechanic. To ascertain this the apprentice is required to make his application direct to the master mechanic or the general foreman, and to be not under 15 or over 18 years of age. He is required to undergo a medical examination so as to assure the head of the department that he is healthy and likely to be able to follow up the trade after he has completed the term of apprenticeship.

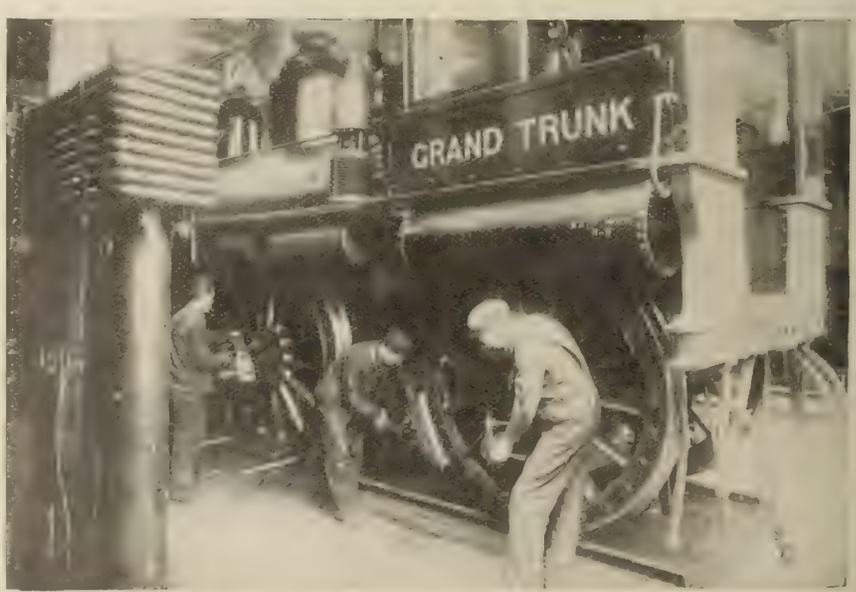
Making Apprentices Think.

Each year the apprentice must pass examinations, his whole training being with the object of making him think. His course through the various shops last five years. He is provided with instruction books and must pass his examination on these before entering the machine shop. The questions asked deal with drill speeds for various work, jigs, belts, etc.

An apprentice is required to seve five years at the following rates : 8c, 10c, 12c, 15c and 17c per hour. Before he is granted each years' advance he is required to pass a written examination on shop work, also make a drawing of some detail part of a locomotive, as specified in the apprenticeship book, which examination and drawing must have the approval of the master mechanic, and the supterintendent of motive power before his advance is allowed.

All Round Competency Secured.

The above system insures thorough education in all details of the trade, and while some of the work may be specialized it is not done by the apprentice until he becomes a journeyman. For instance, the apprentice comes from the boiler shop to the machine shop, from the machine shop to motion bench, to the side rod bench, to the axlebox gang, to the steam pipe gang, to the valve gang, and finally to the erecting gang, so that after an apprentice is out of his time he is a specialist in any one of these branches.



G. T. R. Apprentices at Work in the Montreal Shops.

Efficient Methods Followed in Shops to Reduce Costs

These Tried Out Plans are Reproduced from Factory, and Give Practical Ideas for Saving the Time of Valuable Workmen, Reducing Labor, etc. Question of Spoiled Work as Solved in Certain Factories is also Given.

The methods here given are not complicated systems of red tape. They are schemes that have been devised and tried out with great success. In present day competition schemes and short cuts assist a great deal in producing more for a dollar expended than would otherwise be possible. For any manager who is trying to get more out of his factory these examples of what other men have accomplished in the machine shop should be of special interest.

* * *

Locating the Foreman.

By R. M. Graham.

When the head of a department leaves his desk at the Browne & Sharpe Company's factory, he sets the indicator, Fig. 1, so that if he is wanted he can be quickly located by telephone.

The construction of this little indicator is clearly shown. The metal markers at the sides of the frame slide vertically on a thin metal strip so that they can be quickly set. The building numbers are printed in large figures and the telephone numbers for each department make it convenient to call the man.

* * *

Saving Babbitt Metal.

By H. S. Mitchell.

A gasoline engine factory used a high grade babbitt metal on the crank shaft bearings of its product. This babbitt was purchased in two pound cakes, and the form was such that it fit the average man's hand to perfection.

During the last money stringency the plant shut down for a few days for an inventory. While checking the machining and assembling departments the manager found that these cakes of babbitt were in use all over the shop, as hammers. No check had been kept on the babbitters, so every one had been free to help himself. As no one bothered about returning the battered chunks, most of the machines had several cakes lying on their tool stands.

The manager gathered up all the babbitt and returned it to the stores department. He had the tailings rendered from the babbitt fires and mixed in some lead. The firm purchased a babbitt hammer die and the cost clerk found some waste ends of tubing in the rough stores warehouse, that were just right for handles.

A babbiter was put at work molding hammers, and these were given out on tool-checks, when the factory resumed operations. The money involved in the extra babbitt was not saved, because the material was available if desired, but the money was released, at a time when needed.

* * *

Economy From Using Right Machine.

By C. M. Muruhy.

In a western shop, all the sheet metal from 1-32 inch up to 3-4 inch was formerly punched on one ponderous machine. A punch of smaller dimensions had been suggested, but was thought too expensive for a time of retrenchment.

One morning the foreman went to his supplier with a slip of paper. Upon this paper were figures on the current

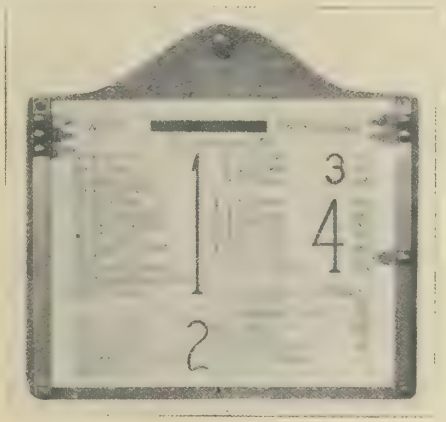


Fig. 1.—When the head of a department leaves his headquarters at Brown & Sharp's, his whereabouts are indicated by the simple little indicator here shown.

waste of time, labor and power incident to handling one class of thin sheeting on the large punch. Below was a requisition for a tiny, inexpensive air punch, and a note showing that in a few weeks the current loss would neutralize the purchase price of this machine.

The buyer had thought a much larger machine necessary. The foreman's low bid accordingly went through, and the instantaneous air punch, set down in the midst of the light work, soon paid for itself.

* * *

Making Errand Boys Responsible.

By H. M. Wood.*

At our plant messenger boys are called to different departments by a special annunciator and push button system. The annunciator is located opposite the tool room window and is connected with fifty push button stations conveniently located throughout the plant. The annunciator location is headquarters for the boys who respond to the bell.

In establishing a basis for paying these boys it was first ascertained that on the average the boys made about fifty calls per day. This figure was taken as a standard, therefore, and each boy was allowed a premium of one-half cent for every call made above fifty a day. If he does not make more than fifty calls, he receives his regular day's pay and no premium.

The number of calls which each boy makes is recorded in the tool room just across the aisle from the annunciator and bench. The boys are numbered from one to twelve, and in the tool room one hundred brass checks about the size of a quarter of a dollar are kept for each boy. When the annunciator indicates a call, the boy next in line reports at the tool room window to run the errand, and at that time one check corresponding to the boy's number is placed in the rack. When the rack is full the boy is credited with a hundred calls and the checks are removed from his rack to be used over again.

The advantages of this system are obvious ; each boy is interested to get in as many calls as possible a day, and consequently the boys respond promptly every time the bell rings.

Moreover the plan makes the boys more responsible and their job appeals to them in a business way. This is not an errand boy's ordinary point of view on his work. Each boy is uniformed in khaki and each wears a numbered shield. On the wall behind the bench is a blue print layout of the factory.

Saving Spoiled Work.

By A. R. Kipp.*

Piece work and the bonus system are, in my opinion, the only methods of wage payment correct in principle. My preference is for the piece-work system. In this the words "For value received" apply as they do in so many financial transactions, and under this system if

* Of the Lodge & Shipley Co.

* Mechanical Superintendent, The Minneapolis, St. Paul and Sault Ste. Marie Ry.

the workman spoils his work he pays for it, unless, of course, he does other damage to co-related parts beyond his control. Nevertheless, the premium is time-saving and good workmanship.

In paying a flat rate per hour, the only recourse an employer has is dismissal, which is at times when skilled labor is scarce very unsatisfactory, so that in my opinion the only solution of the problem of placing spoiled work where it belongs lies in a system of using the piecework principle.

Another question suggests itself as going hand in hand with this one, which is, "What system will present the bill for spoiled work to the proper party?" I believe the answer to this is worthy of consideration when the first one is solved.

Spoiled Work in Brass Foundry.

By Frederick C. Shafer.**

In our brass shop all piece workers pay us for the work they spoil. Of course, the total loss for the spoiled work is not covered in this repayment for spoiled pieces; but, to my mind, this method serves as a check upon carelessness.

Our day workers are not charged for spoiled work. But all the scraps from jobs are collected daily and separated into lots identified as defective in casting or in molding. This enables us to keep a check on day workers also, for if they spoil a great deal of work it comes automatically to the attention of the inspector, who reports the facts to the foreman and to me. The men knowing that this is done, are more careful than they would be otherwise.

In the foundry we have a method for handling spoiled work which has proved very effective. The molders are paid altogether on a piecework basis, and when they spoil work, they are charged back with it. Of course, in charging back, we are very careful that the spoiled work is wholly the molder's fault. A sheet is made out weekly and is placed in the man's pay envelope so that he has definite information as to just the amount of work he has completed.

Concise Cost System for Small and Medium Sized Shops

The Division of Expenses, Pointing out what Should be Considered Productive and what Non-productive Labor, Overhead Expense, Etc.

By GORDON C. KEITH

In a cost system for a small shop the details cannot be gone into with the same elaborateness as in larger shops some of whose systems have been described in these columns. The system for the smaller shops should be concise, taking into consideration that the proprietor must oversee both the office and manufacturing end, and often with the aid of a clerk perhaps, serves as bookkeeper, time clerk and superintendent.

In all shops, large and small there are a number of items that must be taken into consideration in figuring costs. These are rent or its equivalent, taxes, insurance, depreciation of plant, interest and discount, salaries of non-producers, traveling expenses, advertising, printing and stationery, postage, telegrams, freight, cartage, supplies (oil, waste, emery cloth, files, belts, belt lacing, drills, dies, reamers, mandrels, lathe tools, milling cutters, etc.), gas and coal, donations, doctors' bills, spoiled work and bad accounts.

The following classification has been given by a writer in the Iron Trade Review. Of course a number of them will not appear in the small shop used as an example in this article. In keeping track of the various items of expense these can be eliminated. For instance there may be no stable expenses to be dealt with and therefore this item may be dropped from the list. Those that do enter in must be provided for in the cost system:

Classification of Accounts.

1. Real Estate.
   - Interest on the cost of land.
   - Interest on the cost of buildings.
   - Insurance on buildings and equipment.
   - Maintenance of land and buildings.
2. Floor Rate.
   - The sum of the real estate expenses divided by the area in square feet of the entire floor surface, gives the overhead burden on this account per square foot.
3. Power.
   - Interest on cost of equipment for the generation and transmission of power, and its installation.
   - Depreciation of equipment.
   - Maintenance of equipment.
   - Floor rate for space occupied.
   - Cost of fuel.
   - Sundry supplies.
   - Wages of engineers and firemen.
4. Light.
   - Interest on equipment.
   - Depreciation of equipment.
   - Maintenance of equipment.
   - Power necessary to run dynamos.
   - Sundry supplies.
   - Wages of electrician, etc.
5. Heat.
   - Interest on equipment.
   - Depreciation of equipment.
   - Maintenance of equipment.
   - Power, or equivalent horsepower in steam.
6. Shop Transportation.
   - Interest on equipment.
   - Depreciation of equipment.
   - Maintenance of equipment.
   - Power to run elevators, cranes, etc.
   - Wages of elevator men, shop car men, crane men, etc.
7. Machine Rate.
   - Interest on cost of each machine and installation.
   - Depreciation in value of machine.
   - Maintenance of machine.
   - Floor rate, including necessary space around machine.
   - Power to operate the machine.
8. Man Rate.
   - Floor rate portion not covered by machine rates.
   - Consumable tools and supplies.
   - Liability insurance.
9. Productive Labor.
   - Wages of all men working on hand or machine operations on actual product.
   - Man rate, of surcharge or burden per hour.
10. Non-Productive Labor.
    - Wages of superintendents and assistants, foremen and assistants, gang bosses, time keepers, time study men, speed bosses, errand boys, clerks, stenographers, tool keepers, watchmen, sweepers, carpenters, inspectors, laborers, and others when on work not chargeable to production orders.
11. Material.
    - Castings, iron, malleable iron, steel, brass, bronze, etc.
    - Forgings, wrought iron, machine steel, cast steel, etc.
    - Bar Stock: iron, machine steel, cast steel, tool steel, high speed steel, copper, brass, bronze, etc.
    - Sheet Stock: iron, steel, copper, brass, fiber, etc.
    - Miscellaneous: all other kinds in use.
12. Tools and Fixtures.
    - Tools, jigs, gages and fixtures specially made for the purpose of machining, gaging and inspecting the product.
13. General Office.
    - Real estate charges.
    - Interest on equipment.
    - Insurance on equipment.
    - Maintenance of equipment.
    - Salaries of all officials, book-keepers, stock keepers, clerks, stenographers, office boys, and all others employed herein.
    - Light, proportion according to number of lights.
    - Heat, proportion according to cubic feet of space to be heated.
    - Supplies of all kinds for use in the office.
    - Legal expenses, traveling expenses.
    - Telephone, telegraph and postage expenses.
    - Express and freight charges.

14. Sales Department.
    Real estate charges.
    Interest on equipment.
    Insurance on equipment.
    Maintenance of equipment.
    Light, proportion according to number of lights.
    Heat, proportion according to cubic feet of space to be heated.
    Advertising, catalogs, circulars, etc.
    Allowances, collections interest.
    Legal expenses, traveling expenses.
    Supplies of all kinds for use in the office.
    Salaries and commissions.
    Engineer's expenses, preliminary drawings and estimates.
    Telephone and telegraph expenses.
    Mailing expenses.
    Express and freight charges.
15. Stable.
    Real estate charges.
    Interest on equipment.
    Insurance on equipment.
    Maintenance of equipment.
    Supplies, hay, grain, etc.
    Wages of stable men, truck men, etc.

In order to illustrate the distribution of costs under the various heads, take for example a small shop employing about fifteen hands. There are a great many of such shops in Canada, growing concerns that should have a cost system.

Shops located in power buildings pay to the landlord a fixed sum per year for space, power, heat, elevator service and watchman. The charge is about 25 cts. per sq. ft. and the shop pays so much for the space occupied by the building and not for the net available space.

Shops occupying their own ground and buildings are obliged themselves to pay for the above mentioned power, heat, elevator service and watchman, and in addition, they must pay interest on the value of the grounds and buildings, real estate taxes, insurance on buildings, repairs on buildings, power and heating plant. Except in the case of very large plants, the cost is greater than renting, but the cost would be at least 25 cents per square foot.

In figuring the amount of space required for running a certain number of men on medium sized work, without crowding, it is customary to allow 150 square feet for each man employed. This would require a shop of 2,250 square feet. This would cost $562.50.

The real estate and water tax is included under the head of "Rent or Equivalent."

Insurance.

The rate of insurance varies a great deal and depends on the quality and arrangement of buildings, and contents, fire protection, watch service, and its location. In what is known as a mill constructed building, fitted with automatic sprinklers and good watch service, the rate is much less than other construction. Fifty dollars per year will be a small estimate, but will serve to illustrate the distribution of costs.

Depreciation of Plant.

Everything in a machine shop wears out after a time. The length of time required to wear out a machine varies greatly under different conditions, but no matter what these conditions are, the machine becomes worth less and less until it is finally not worth shop room, and has to be replaced by a new tool. The plant cannot be figured at its full cost value each year, and then finally when the machines are worn out, replace them with others, charging the cost to the expense of that particular year in which the change is made.

What is done is this. The average life of a machine is found out and the cost is divided up into as many parts as there are years of its life, and each year one of these parts is taken from the value of the plant, considering the part thus lost in the expense of operating. When thus divided up one of these parts is called a depreciation. Machines wear out in from ten to twenty years. In the first case one-tenth of the cost of the plant must be added to the running expenses each year and in the latter case, one-twentieth. In a shop such as has been suggested the machinery equipment would have a value of probably $6,800 which includes tools, jigs, patterns, etc. If the depreciation was one-twentieth, then $340 must be added to the running expenses each year.

Interest and Discount.

In a general way both these words mean the same thing. Interest is the price paid for money. It might be called rent. Few concerns are able to carry on business without borrowing more or less money, and while borrowing is the word used the money must be paid on a certain day and an additional sum is charged for its use.

Productive labor is understood to mean the wages of those men who work on actual production. Non-productive labor includes all labor that cannot be directly charged to productive labor.

Material covers all stock that enters into the product. This does not include tools which are included in general expense. Insurance on material is added to the cost of the material. There is also labor on the material received, but this is included in the general expenses and added as a per centage over the product.

The total therefore consists of three items: material, productive labor and overhead burden. The overhead burden includes non-productive labor, general office expense, tools, depreciation, etc.

The overhead expense is figured as a per centage of the productive labor and when the cost of material and productive labor is obtained by a time-keeping system, by adding a per centage of the productive labor to these two items the total cost is obtained.

In some systems it is the practice to figure the percentage of overhead charge yearly, others half-yearly and still others monthly. The general expense accounts for a small shop may easily be made up monthly and for estimating that percentage, may be used for the succeeding month. The percentage varies little from month to month as a rule and the manufacturer, whether large or small can thus keep in close touch with the manufacturing costs.

CANADA'S TRADE RELATIONS.

In the March issue of Canadian Machinery reference was made to French and German tariff arrangements. A list was also given of French and Canadian goods affected by the treaty.

Attention was also drawn to the fact that a trade arrangement had been made with Germany, whereby the surtax of 33 1-3 per cent. has been abolished and German goods will now be taxed at the general tariff rates. Among the articles which Germany has chiefly exported to Canada, the duty on which is now removed are: Clocks, glue, glass, springs and axles; rolled iron or steel bars, angles and other shapes; agate, granite or enamelled iron or steel ware; scientific instruments; chemicals; dry red lead, etc.

The following goods are among those which may be entered into Germany at the conventional tariff rate: Grain, fruits, timber, greases, alcohol, leather for manufacture of driving belts, pulpwood, etc.

Canada's preference to Great Britain was the cause of the German tariff war, which is now over. Canada has maintained that foreign nations should not coerce her in tariff law-making. Happily a tariff war between the United States and Canada has been averted by the tact of a number of far-seeing officials and Canada will enjoy the United States minimum tariff. Had no agreement been arrived at, Canada would have retaliated with a 33 1-3 per cent surtax. Canada conceded lower duties on thirteen articles mostly foodstuffs and fancy goods, and President Taft has accordingly issued a proclamation giving Canada the benefit of the United States minimum tariff.

Canada's brightest year has dawned and with a great number of industries and gigantic undertakings under way, it is essential that Canada should be at commercial peace with the many nations with which she can exchange products. Arrangements are being made for a full discussion of the trade relations between United States and Canada, when it is expected that reciprocity adjustments will be made.

Efficient Handling of Raw Material at Minimum Cost

A Convenient System for Handling Material Installed in the "Chiclet" Factory, Toronto, by W. D. Beath & Son, Toronto—It is a Modern Labor-saving Device.

The accompanying illustrations show effective methods used in the factory of Frank H. Fleer & Co., Sterling Road, Toronto, for the handling of raw material. In this case it is chicle, imported in bags from Mexico for the manufacture of Chiclet chewing gum. The system is applicable, however, to a great number of enterprises, and a large number of instalations have been made resulting in a great saving of labor.

A railway siding runs into the yard and the chicle is loaded on to the carrier. From the point of unloading a covered trolley system extends to the warehouse and runs along the front of the warehouse, past several doors, as shown in Fig. 1.

When loading, one end of the carrier rests on the platform to facilitate loading. The end is then raised to the level of the other by means of the block and pulley, which may be easily seen in Fig. 2.

After loading, the carrier is moved along the trolley to the scales, where a section of the trolley is disengaged. The weight is then read direct. This completed, the trolley connection is again made, and the material is moved along until opposite the door of the warehouse where the material is to be stored. Then by simply pulling a lever the carrier is switched to the siding running into the warehouse. Fig. 3 shows the carrier being switched from the main trolley to the branch one, running into the warehouse.

There are thus only two handlings of the chicle, unloading the material from the car to the carrier, and again from the carrier at the warehouse.

When the chicle is required for manufacture, the trolley and carrier are again used. The chicle is taken by means of the trolley to the elevator, by which it is taken to the grinding room. In returning the finished product to the warehouse the trolley and carrier are used in a similar manner. They are also used in shipping the prepared raw material to the United States factory, the scales being used in a similar manner as that described above, in re-shipping.

One point in connection with this system of trolley is illustrated in Fig. 3. Very little space is required in turning into the warehouse. It is a single rail system, and can switch and turn on a radius of four feet. The system was installed by W. D. Beath & Son, 193 Terauley St., Toronto.

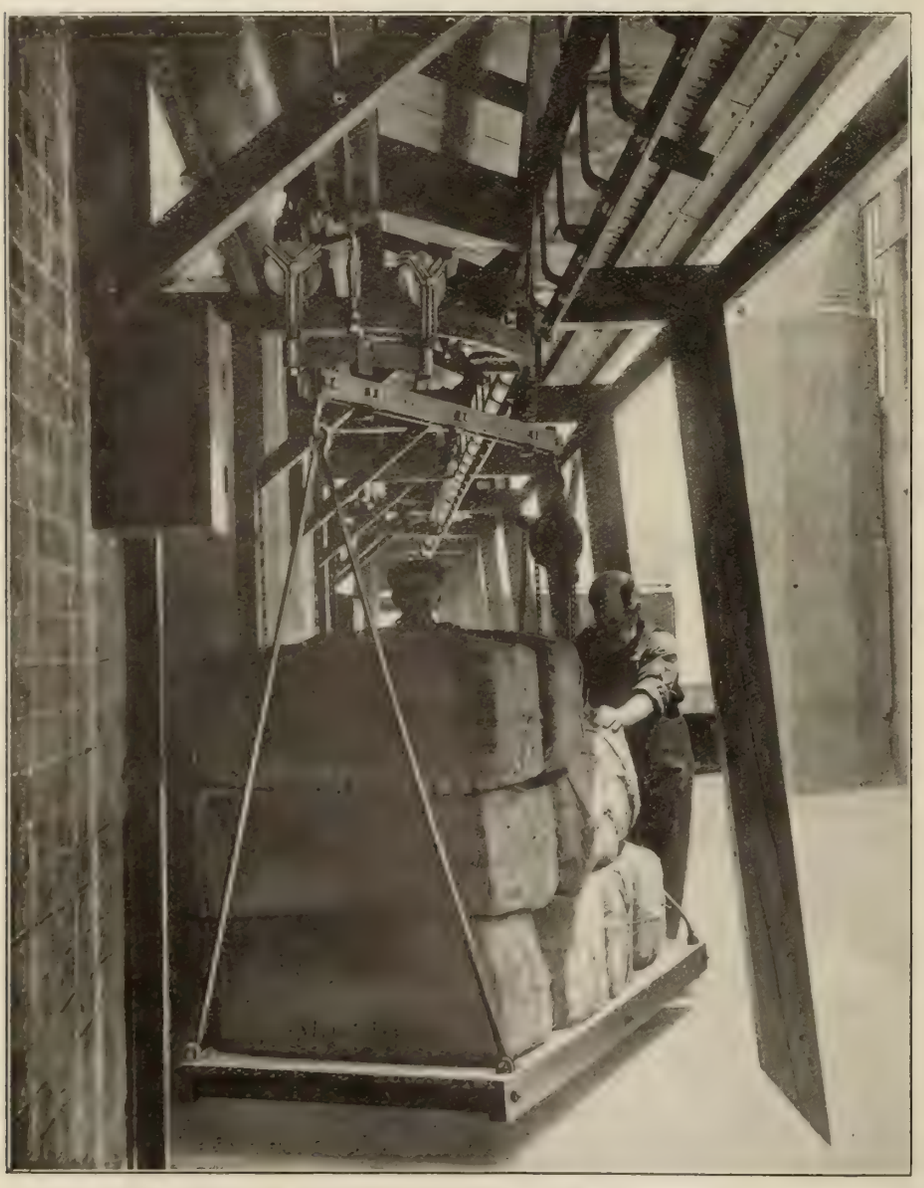

Fig. 3.—Carrier Being Switched to Warehouse.

RUMORED MACHINE TOOL MERGER.

There has been a rumor to the effect that a big manufacturing merger is in process of formation with Galt as its headquarters. Five large plants were mentioned, covering machine tool and wood working lines. Such a merger would require a capital of about $2,000,000, and while there has been talk of it, and several Canadian companies have been approached, Canadian Machinery has advice from some of the larger companies said to be interested, that they are not likely to seriously consider the present propositions presented to them.

It was also reported that wealthy United States manufacturers were behind the venture, but investigation has been unable to show anyone with capital behind the scheme outside of the Canadian companies themselves. Unless some other conditions arise, the Canadian companies are not likely to hazard their interests in a new venture.

R. S. Shoemaker, for some time connected with the Pittsburg Steel Company at Monessen, Pa., as electrical engineer, has become assistant consulting engineer of the Algoma Steel Company, Ltd., Sault Ste. Marie, Ont.

The Design of Bevel Gears ; Shafts Acute and Obtuse

Part II. on the Design and Manufacture of the Varions Types of Gears, Giving Information and Tables of Great use to Mechanical Men.

By G. D. MILLS

(Continued from March issue).

The interior gear can be cut with an automatic gear cutter by slightly altering the slide, or it may be cut on a milling machine.

In order to provide correct profiles of the teeth of bevel gears, it is first necessary to determine the pitch diameters of equivalent spur gears and on their pitch circles construct the profiles, which are the profiles of the teeth of the bevels on the edge line. The radius of the pitch circle of either spur gear is readily obtained graphically, by extending the edge line where the wheels mesh, in either direction, until it intersects the centre lines of both shafts. Its length is the distance from this point of intersection to the centre line of teeth as they mesh, and the angle at this point of intersection, is the compliment of the centre angle. The radius may be calculated by dividing the half pitch diameter of the bevel gear by the sine of angle at point of intersection, or cosine of centre angle. The pitch diameter of an equivalent spur gear is therefore the pitch diameter of the bevel gear, divided by the cosine of its centre angle, and since the numbers of teeth bear equal proportions

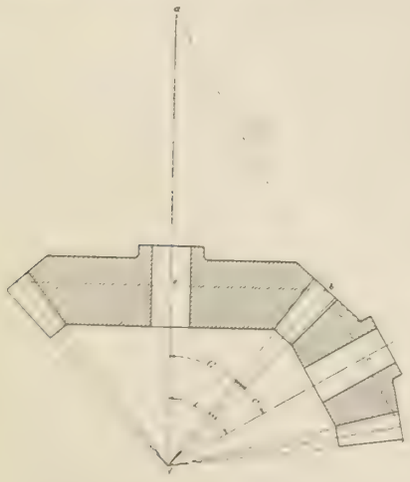

Fig. 8.—Gears With Shafts Acute.

to the pitch diameters, our formula, "number of teeth to select cutter for" is therefore the number of teeth in the bevel gear, divided by the cosine of its centre angle. Correct profiles of the large and small ends of teeth should be provided during the operation of cutting the teeth, that the blank may be tried direct or with a gauge, and any defects remedied by filing.

In Figures 8 and 9 which follow, will be found another method for obtaining the centre angles of acute and obtuse shafts, which presents many attractive features. In Fig. 8 are arranged a gear and pinion with shafts at an acute angle. In the above we have the angle of shafts L also the two pitch diameters. Tangent C is found by dividing the half

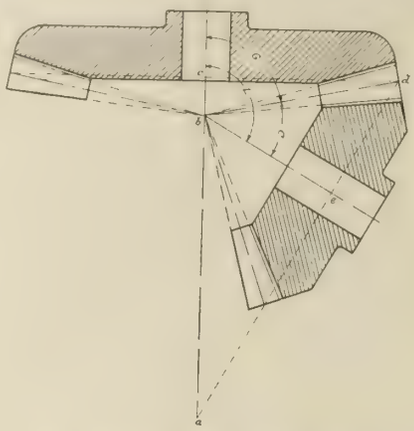

Fig. 9.—Gears With Shafts Obtuse.

pitch diameter of pinion or length bc by length cd which length however must be calculated. It will be noticed that the pitch diameter of pinion has been extended until it intersects the centre line of gear shaft at the point a, and that in the right triangle acd, the angle L is one of its angles. The angle at a is therefore the compliment of angle L. In the upper portion of Fig. 8 is a certain other right triangle acb. If we divide the half pitch diameter of gear or length eb by the sine of angle at a or cosine L, we shall have the length ab which is added to bc and our length dc is then ac multiplied by the tangent at a or cotangent L from which is derived this formula for acute shafts. Tangent C=

$$\frac{N_2}{\left(\frac{N_1}{\text{Cos. L}} + N_2\right)\text{Co} + L}$$

Angle G=L minus C.

Shafts Obtuse.

In Fig. 9 will be found a diagram of two gears with shafts at an obtuse angle.

As before the pitch diameter of pinion has been extended until it intersects the centre line of gear shaft at a, the triangle being reversed in this case, and we have the angle of shafts L also the two pitch diameters. Tangent C is therefore the half pitch diameter of pinion divided by the length be which length may be calculated in the right triangle abe. The angle at b is the supplement of angle L and its compliment is the angle at a. The enclosing right triangle acd has for one of its sides the half pitch diameter of gear or length cd which divided by sine a or cosine L gives us the length ad from which is deducted the half pitch diameter of pinion or length de. Our distance b e is therefore length as multiplied by the tangent at a or cotangent L and from which is derived this formula for obtuse shafts, tangent C=

$$\frac{N_2}{\left(\frac{N_1}{\text{Cos. L}} - N_2\right)\text{Co.} + L}$$

Angle G as before equals L minus C. Figures 8 and 9 still further verify the method as set forth in Fig. 2, since the results obtained are the same by either method. While the graphics of these last two figures are more brief than that of Fig. 2, the formulas obtained by the first method are to be preferred. It has been the writer's aim to fully set forth and prove the methods from which the centre angle formulas are derived and to provide practical examples for their application. I am sure the necessity for each operation will be apparent to every one who has practical designing of this kind to do. Bevel gears when new should mesh as close as possible without actually binding since the wear on the teeth will in time make them loose, and for this reason spiral gears are often preferred as the screw like motion of spirals take up the wear on the teeth so that it is almost imperceptible. They, therefore, wear longer and may be set at any angle, or made to mesh with a spur gear, the array of formulas and graphics connected with spiral calculations, however, is greater than for bevel gears.

G. Y. Chown, B.A., Registrar and Treasurer of Queen's University, has reconsidered his decision and will retain his connection with the University in the above capacity.

Machinery Equipment for N. T. R. Shops, Winnipeg

Machinery and Tools, Motors, Furnaces and Forges, Cranes, Air Compressors, Grey Iron Foundry Equipment, Brass Foundry Equipment, Belting, Shafting, Hangers, Industrial Track, Lockers, Etc.

The building and equipping of the National Transcontinental shops at Winnipeg is one of the largest undertakings of its kind that has been undertaken in Canada. When one considers the size of these shops it will be understood that the equipment will cover a large and varied line.

The shops consist of fourteen units, as follows:—

1. Round house to accommodate 25 locomotives.
2. Locomotive shop, 823' x 174' with 26 engine pits.
3. Store house, 62' 6'' x 262'.
4. Forge shop, 104' 9'' x 264' 9''.
5. Oil house, 30' x 40'.
6. Power house, 154' 9'' x 110'.
7. Carpenter shop, 104' 9'' x 74' 9''.
8. Watertank of 100,000 gals. capacity.
9. Chinmney 200' high.
10. Grey iron and brass foundries, 204' 9'' 134' 9'', with cleaning room 64' 9'' x 82' 4½''.
11. Crude oil storage, 25' x 62'.
12. Frog shop, 64' 9'' x 104' 9''.
13. Storage platform, 56' x 180' and superstructure, 58' x 151'.
14. Iron storage, 30' x 60'; coal, 30 x 30'; coke, 30' x 20', and scrap, 30' x 100'.

The shops are located at Springfield, east of Winnipeg, and the work on the pumping plant and reservoir must be finished and the machinery ready for operation by August 1, 1910. The buildings are nearing completion, and it is expected that the works will be in operation by Jan., 1911.

Power Plant.

The current to be used is 3-phase, 60-cycle 550 volts, alternating current.

The air compressor will be of the horizontal type with two-stage air cylinders designed for motor drive. It will have a capacity of 660 cubic feet of air and speed of 150 r.p.m. Air will be used at from 80 to 120 lbs. per sq. in. The air valve inlet gear will be of the Corliss type. The outlet valves will be of the high speed type.

Machine Tools.

The machine tool equipment makes a long list of machines of well-known types. These include lathes, drills, shapers, planers, grinders, boring machines, etc., necessary for efficient work in the construction and repairing of locomotives.

The shops have been divided into departments and the tools will be arranged in groups. There are two general groups in the locomotive shop. No. 3 and 4 are the piston, motion and crossheads; 5, tool, 6, 7 and 8, are bolt departments; 9, rod; 10, brass; 11, 12 and 13, boiler and tank shop, and 14, flue and pipe shop.

A number of the tools will be equipped with individual motor drive including bending rolls, 200-ton hydraulic press shears, 42'' car wheel lathe, etc. There wil be a number of hydraulic machines including punches, riveters, 560-ton hydraulic forging press, 4-column type, etc.

The forge shop will have machine tools for cutting, centreing, forging, etc. The hammers will be two of 200, one 1,250, 1,500, 3,000, 3,300, 3,500 and 5,000 lbs. There will also be hydraulic bull-dozer, squeezer, etc.

The scheme of grouping is being carried out in all the shops, so that work will pass through the shops with the least number of handlings.

Cranes.

The locomotive erecting shop will have one 120 and one 10-ton electric crane; machine shop, two 10-ton; boiler shop, one 30 and one 10; riveting tower, one 20; tank shop, one 20 and one 5; grey iron foundry, one 15-ton with a 5-ton auxiliary hoist for light work; cleaning room, one 5-ton; forge and tank shop, one 10; and yard midway, one 10-ton. These are all electric. There are also the following hand hoists: power house, one 10-ton; stores, one 10; and grey iron foundry, three 1-ton. Jib and bracket cranes are also arranged throughout to facilitate the handling of work when the large cranes are in use.

Foundry Equipment.

One cupola will be 50' in height, sheil 84'' diameter; wind box 104'', with 12 tuyeres. The second will be 50' in height, with shell 72'' diameter, wind box 92'', shell of cupola to have 12 tuyeres.

A 40 h.p. motor will drive the blowers. The cupolas will be equipped with pneumatic charging machines and the charging floor will be served with a 4,000 lb. pneumatic elevator. Tumblers, grinders, core oven, pneumatic sand sifters, ladles, brake shoe, molding machine etc., will form part of the equipment.

In the brass foundry will be four 26'' diameter brass furnaces, and one 32'' diameter, core oven, metal cutting band saw, sprue cutter, tumblers, axle brass molding machine, etc.

Thousands of feet of belting will be required for the various shops. In each shop there will be a number of tools specially designed for the work in the new shops of the National Transcontinental at Winnipeg. When completed the shops will be among the most modern and best equipped on the continent.

PERSONAL NOTES.

W. R. Sweaney has been appointed business manager of the Toronto Electrical department.

D. MacDougall has been appointed assistant general manager of the Dominion Iron & Steel Co., Sydney, N.S.

Mrs. Main, wife of J. J. Main, manager of the Polson Iron Works, Toronto, died in March after a few hours' illness at her home in Toronto.

Mr. Mitchell, superintendent of the Dominion Iron & Steel Co., Sydney, has been visiting the steel centres of the United States investigating the latest practice and ideas for the new mills to be installed this summer at Sydney.

J. J. Foote, manager of the McClary Mfg. Co.'s Winnipeg warehouse, spent a day in Toronto last month, on his way back home from a visit to the London head office. He reports bumper business in the west and expects this fall to outdo the record established last year.

J. C. MacLeay, superintendent of blast furnaces, Dominion Iron & Steel Co., Sydney, was severely unjured on March 19. One of the workmen accidently poured cold water into a hot slag pit causing an explosion in which Mr. MacLeay and five workmen were injured.

Those who perused the "First aid to the Injured" article in Canadian Machinery for February will be further interested to note that the writer of the article, S. A. Gidlow, has had the distinction conferred upon him of Hon. Associate of the Order of St. John of Jerusalem in England. This honor was conferred upon Mr. Gidlow by King Edward upon recommendation by the Prince of Wales, who is the Grand Prior of the Order.

SYSTEM AT BALDWIN LOCOMOTIVE WORKS.

There is surely a reason for the progress of large manufacturing establishments. Take for instance, the Baldwin Locomotive Works, there is a firm of world-wide reputation. In these works are built locomotives, not only for American railroads, but for roads in almost all countries in the world, thus competing successfully with the locomotive manufacturers in all these different countries. There must be a reason why locomotives can be built at Philadelphia, shipped to any country in Europe and placed on the roads there for the same cost or less than they can be built in shops in that country. Giving all due credit to the national advantages this works has, because of its geographical position, the greater part of the credit must be due to the management of the works, a review of the chief points in the management policy of this establishment would probably throw some light on the reason for their success.

In these works are employed in the neighborhood of 15,500 men, distributed among 20 departments. The executive consists of one superintendent, four assistant superintendents and twenty foremen, one for each of the departments. The foreman in each department has assistant foremen and underforemen according to the size and importance of the department. Each under-foreman is a specialist in his line of work. Each department is a factory in itself, turning out special parts of the locomotive. Each department is operated on contract or piece work system. Now there is considerable diversity of opinion regarding the best methods of paying labor, but the success or non-success of any system of payment does not depend on the system alone, but also on the way the system is managed. It is the claim of the Baldwin Locomotive Works that under careful management they get more work per man out of their piece workers than any other similar concern in the world, and that their men are allowed to make higher wages. Dissatisfaction is rare at Baldwin's, and they have no strikes.

No attention is paid to unions at Baldwin's. A man is hired on his own merits, and after he enters the works he is expected to abide by the regulations of the shops.

Their system of apprenticeship is worthy of notice. They find their apprentices of great value, simply because they have been brought up in the work and therefore are much better able to fill positions in the works than any mechanic unaquainted with the system. The apprentice system is as follows:—

The apprentices are divided into three classes, i.e., first, those with an ordinary public school or grammar school education; second, those with a high school education; and third, those who are graduates of a technical school. A first-class apprentice must be 17 years of age. He serves 4 years; and during that time he is moved from one department to another until he has been through the whole works. He attends night school two nights in the week to take up mathematics and mechanical drawing. His pay ranges from $3 to $6.60 per week during his apprenticeship, and on completion of his time receives a certificate and $250. A second-class apprentice serves 3 years instead of four and gets from $4.20 to $6.60 per week, and upon completion of time receives a certificate and $200. He also attends night school. The third-class apprentice serves 2 years, and does not attend night school. He gets from $9 to $12 per week and a certificate upon completion of time.

There is another feature of the management that goes towards making the firm what it is. The foremen of the different departments are encouraged to improve existing conditions, and they are sent by the firm all over the country to see and appropriate new ideas. If a foreman can prove that by the instalation of some new machine, work can be handled in a more economical manner, he is furnished with the machine without any question, and in this manner the works are kept up-to-date in every particular. Because they are up-to-date in every particular is a very substantial reason why they can compete with manufacturing plants so far away from home. Many of the shops in England, Sweden and Russia are 25 years behind in equipment.

Thus the secret of success in manufacturing is to keep up with the times.

IRON BOUNTIES TO CEASE.

The Dominion Government has announced that it would not renew the iron and steel bounties at the end of the coming fiscal year. The bounties have been in force fourteen years and the Government believes the industries are now established on a sufficiently firm basis to stand alone. These bounties were fixed on a sliding scale for different iron and steel manufacturers, decreasing year by year, and varying from $2.10 per ton for pig iron produced from Canadian ores in the calendar year 1907 to 40 cents per ton for pig iron from foreign ore produced this year. The extent to which these industries have grown is shown by the following schedule of bounties paid during the year ending March 31, 1909:

Pig iron	$693,423
Steel	838,100
Mfrs. of steel	383,091
Total	$1,914,614

Since 1896 a total of over $14,000,000 has been paid in iron and steel bounties, the abolition of which will not affect the protection of $1.50 per ton upwards imposed on imports of iron and steel.

BROWNING ENGINEERING CO.

The Browning Engineering Co., Stop 118, Shore Line, Cleveland, Ohio, have been instaling a number of locomotive cranes in Canada. They have had a number of requests for operators for their locomotive cranes and are anxious to have the names and addresses of available men on file for positions as they open up. Two important instalations were described in a recent issue of Canadian Machinery. These were at the Canadian Locomotive Works, Kingston, and Angus Shops, Montreal.

BOB'S BALKY PUMP.

By C. Tuells.

Bob was a good-natured, curly-headed apprentice boy in the best and largest machine shop in town. He had passed the days when the men used to send him to the blacksmith shop to get the teeth of a file drawn out a little longer, or to the stock room for a half-inch counterbore with a five-eighths pilot. As he was in his second year, he got fairly good work—compared with turning pulleys and snagging castings, or running errands and "chasing the broom."

He was now at that stage of the trade where he was commencing to earn a little money for the company, for he could make a simple machine or a plain jig as well as most of the journeymen, and there was quite a difference between his thirteen cents an hour and the journeyman's thirty, which went on the right side of the books.

One day the boss brought around the blue-prints and castings for a rotary pump and gave Bob instructions how to make it. It was his first pump, so with all the vigor of ambitious youth he "waded into his job." He bored out his casting for the pump casing, turned up his gear blanks, and made his union as good and as quickly as the best of the men could do. True, he slipped up cutting one of the gears, but he hustled out a new blank, and this time his gears were cut the right number of teeth and the proper pitch.

After three or four days of interesting work his pump was completed and ready to be tested before being sent out of the shop. In "trying out" a rotary pump, it was customary to set it up on the ways of an old lathe, with the pump spindle in the chuck and the inlet and outlet pipes reaching to the floor into buckets ; in this way, by starting the lathe, a bucketful of water was pumped from one bucket to the other, when everything went right.

Well, Bob got his pump set up all right, and it pumped, and pumped good, too. After pumping a few bucketfuls he shut off the power and went to get the boss to inspect the pump and see it work—his mind in that harmonious state that always accompanies a successful job.

In the meantime, two of Bob's brother apprentices conceived the brilliant idea of inserting a large cork stopper in the end of the inlet pipe and pushing it up out of sight.

Bob soon came back with the boss, who, after looking it all over, ordered him to start the pump. The pump started all right, but, strange to say, there was "nothing doing" at the outlet end, much to Bob's astonishment, and all attempts to make it pump were in vain.

The boss looked dubious and Bob looked worse, but the sly glances his fellow apprentices cast in his direction were full of fiendish glee. After telling Bob to "pull her to pieces and see what's the matter," the boss left Bob to work

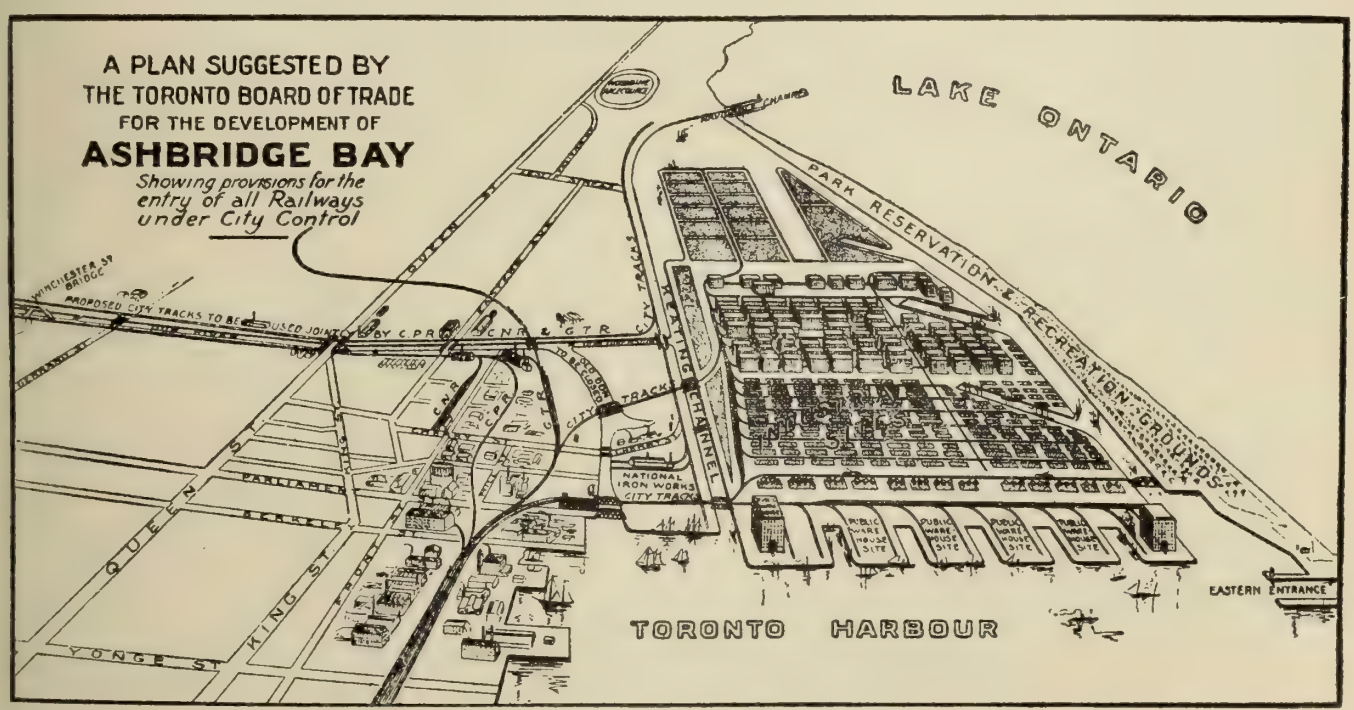
"There was nothing doing at the outlet end, and all attempts to make it pump were in vain."

out his own salvation. Although he took the pump apart and examined every inch of it thoroughly, he could find nothing wrong, until he tried to look through the inlet pipe—he couldn't see light. Then Bob knew what the trouble was, and another leaf was added to his book of experience.

Back together went that pump in double-quick order, and this time it worked fine and to the satisfaction of the boss. Bob's detective abilities traced the stopper to the empty bottle in his shop-mates's dinner box, and it wasn't long before he was paid back in his own coin—but that's another story. —Machinery.

When comparing competitive bids on direct current electric motors one manager always keeps in mind the fact that the cost of the machines increase with the horsepower, but decreases with the speed.

For emergency work about the boiler shop, the foreman of a locomotive factory constructed six small hand trucks, heavy and low wheeled. On three of these he rigged anvils : on the others, forges. When a bit of smithy work is needed on some massive part, such as a boiler or firebox, one of these forges is dragged in and connected with the air main. The anvil follows ; and the work is done, independent of other smithing, in quicker time than work could be taken to the blacksmith department, run through the routine and returned.



At a luncheon given by President W. J. Gage to members of the Board of Trade, Toronto, recently the following resolution was unanimously passed :—

"Whereas the Board of Trade of the city of Toronto consider the control of the waterfront in and contiguous to Toronto is essential to the commercial development of the city ;

"And whereas no satisfactory plan of development can be devised and carried out without permanent concentration of authority ;

"And whereas the proper development of the waterfront will enrich the city many millions by enhancing the actual value of its property in Ashbridge's Bay and elsewhere ;

"Be it therefore resolved that this meeting most strongly urges placing the management of our waterfront in the hands of a commission, and that the Secretary be instructed to forward a copy of this resolution to the Mayor, Board of Control, and Council of the city of Toronto, with a request for immediate action."

SAWMILL DEVICES.

By Staveley.

For the purpose of lifting round logs on to rack benches or timber frames, a suitable device is necessary for carrying out this operation quickly. If the logs

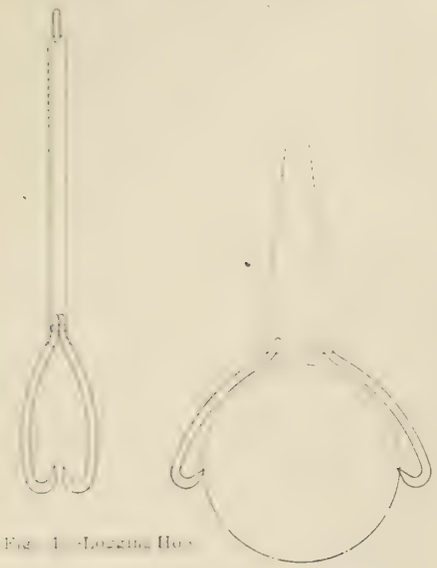

Fig. 1.—Logging Hook.

Fig. 2.—Gripping a Log.

come into the mill, drawn up by an endless chain, they rest on the floor, and there is no way of passing a sling chain under, or if there were this would take a longer time, than the hooks shown in Fig. 1. These are made from a good class of $1\frac{1}{2}$"x$1\frac{1}{2}$" iron, and a $\frac{5}{8}$" chain goes through the eye of each and through the ring which is attached to the traveling crane hook overhead. Fig. 2 shows the hooks gripping the log, which slide

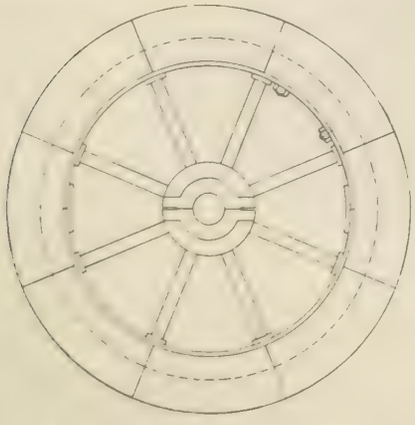

Fig. 3.—Pulley Lagged With Timber.

or adjust themselves on the $\frac{5}{8}$" chain, as in the sketch. The hook points are sharp and hardened, so that they dig themselves into the log, when the slack is hauled up.

Fig. 3 shows how a W.I. pulley in halves can be lagged with timber, either for a belt or rope drive. In the figure, it has has been shown for a rope drive. The segments are cut from well seasoned hardwood, the grain running radially. The segments are well bedded to the rim and fixed by tee-headed bolts let into the wood, so as to clear the ropes. By removing the segments over the lap plates, the pulley can be removed in halves in the usual way.

ABOUT CATALOGUES.

By K. Campbell.

There are other troubles for the recipients of catalogues besides the filing of the heterogenous collection of catalogues that are necessary in a well managed manufacturing plant. We successfully disposed of the filing difficulty by using vertical files and following the same manner as in letter filing. In this connection, we used a double card index in which the names of the companies were tabulated alphabetically with a list of the lines manufactured given on the card of each company. On the second index the various articles in which we are interested were listed alphababetically and on each card the names and addresses of the companies manufacturing these lines were given.

The point I wished to bring to the attention of those issuing catalogues is to be sure to have the name and address of the company on the catalogue. In fact it is a good idea to have it on every page. A page is often torn out and sent to the superintendent or foreman. It is returned only to find that there is no name on the page to tell from which catalogue it was taken. The one in care of the index must trust his memory and if there is a page from one catalogue sent to the foundry foreman, another to the carpenter shop, the pattern and a few other departments, it is practically impossible to trace some of the pages. It would be an easy matter to have the name and address of the company on every page.

The technical, trade and daily press are careful to have the name and address on every page and the manufacturer who issues catalogues would do well to follow this example. Orders are sometimes lost through this neglect.

Perhaps it would be hard to believe, but it is a fact, that catalogues are received in our office containing no name or address to designate the company issuing them. British manufacturers are the chief offenders in this regard as far as I can learn. We have received catalogues on which there was absolutely no name or address and consequently, if we had not been interested in the lines the catalogue would have been relegated to the waste basket instead of following up the trade-mark and thus locating the name and address after a great deal of inconvenience. It is an easy matter to carry out the suggestion of having the name on each page and is worthy of consideration.

$10 For An Idea

For the "Machine Shop Methods and Devices" department of Canadian Machinery.

We want ideas for this department—ideas of practical, labor-saving, cost-reducing value. We will pay at regular rates for each idea accepted, and in addition will pay $10 for the best idea submitted during the next six months—that is, until Sept. 30, 1910.

Address all communications to the Editor of Canadian Machinery, 10 Front Street East, Toronto, Ont.

FRICTION CLUTCH REQUISITION FORM.

The two illustrations shown are used in connection with ordering friction clutches by Vandeleur & Nichols, Electrical, Mechanical and Constructional Engineers, Dineen Bldg., Toronto, but they may be applied to requisitions in the factory and in ordering various articles and equipment.

Standardizing will allow the use of this method of making drawings. In connection with the clutches the various measurements are indicated only. The sizes are filled in to suit the conditions under which the clutch will be operated.

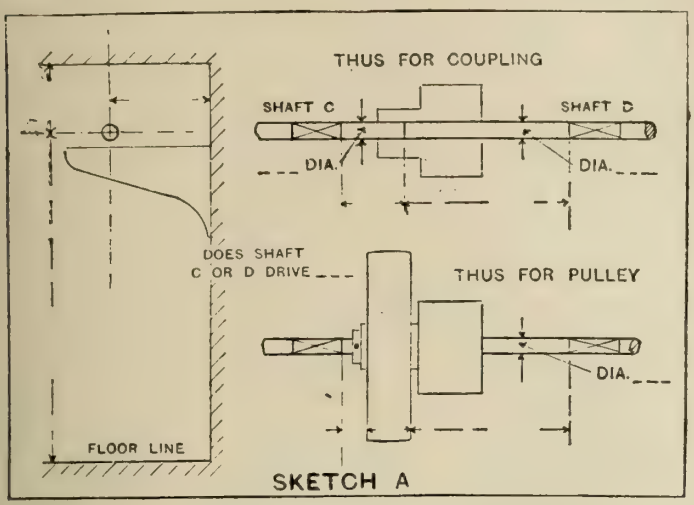
In ordering a clutch a customer is asked to give the following information:

1. Maximum horse power in ordinary work.
2. Maximum horse power at starting (which is generally greater than 1.)
3. Revolutions per minute.
4. How often in the 24 hours will the clutch be put in and out?
5. Are there any heavy masses, flywheels, large belt, or rope pulleys, heavy machines, etc., to be put in motion? If so, give particulars.

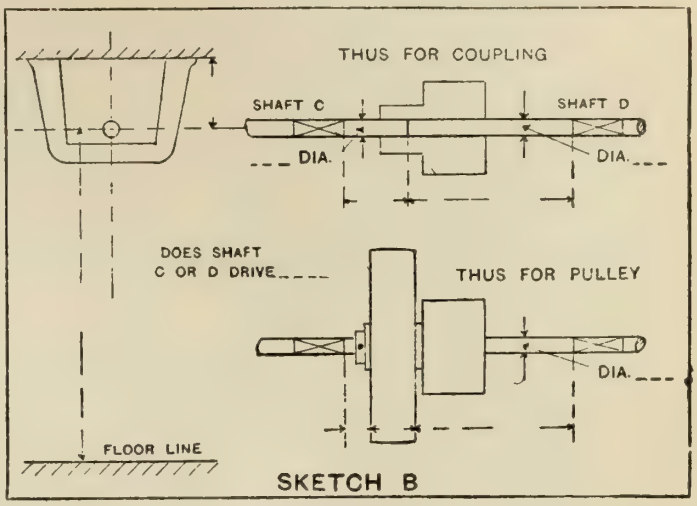
6. What kind of machine or machines is clutch to drive ?

7. What kind of motor drives clutch —steam, gas, oil, electric, turbine, etc. ?

8. If clutch couples shafts, give their diams. and fill in dimensions in sketch below.



Sketch A.—Clutch Requisition.



Sketch B.—Clutch Requisition.

If the clutch is to carry belt or rope pulley, gear wheel, etc., state, in addition to the above :

9. Diam. and width of pulley, width and thickness of belt, or particulars of gear wheel.

10. Diam. of rope pulley ; number of grooves ; size of ropes.

11. Does pulley drive shaft, or shaft pulley ?

12. Average length of time per 24 hours during which clutch would be out of gear with either part running.

13. Give shaft diams. and fill in dimensions on sketch below.

If striking gear is required :

14. If the shaft is carried as either sketch A or B, fill in dimensions on that sketch. If neither meets your case, give rough sketch in space below (or on back of form), showing how shaft is carried, whether in slings, hangers, brackets, pedestals, etc., and giving dimensions corresponding to those in sketches A and B.

Where a number of articles are manufactured with variations in certain measurements these could be left as in the accompanying illustrations and filled in on the blue print.

Another method, and one that is used a great deal, is to designate the distances by letters. Then when an article is required a table may be prepared giving the measurements for the various letters.

TIME KEEPER'S DAILY REPORT.

The accompanying illustration shows the form submitted by the time keeper to the general manager every morning, at Frost & Woods, Smith's Falls, manufacturers of agricultural implements. In the columns A, B, C, etc., are entered the check numbers of those who are absent.

In the column at the right are entered the total number present, the number on the roll and the corresponding figures for the year previous.

One of these forms is filled out for each working day so that the general manager can tell at a glance each day, the number on the roll, those absent, any new men starting and those leaving the employ. If any department is behind on the work the foreman of that department, the superintendent, and general manager can co-operate in obtaining sufficient men to keep up the work. The form keeps the general manager in close touch with the conditions in the shops.

At the foot of the sheet is given the check number and name of each new employe and workman leaving the employ of the company. In the case of those leaving the employ, the reason is also stated.

BURNING A WIRE CABLE IN TWO.

The quickest and best way to cut a cable, is to place it in the forge fire and burn the strands in two. Almost any size or kind of hoisting cable may be easily separated by this method.

First mark the place to be cut and hold the cable in the fire until there is a shower of sparks thrown off. Begin pulling on both parts of the cable at this time and when it is heated to a welding heat give the parts a good hard twist in the direction of the strands. This will pull the cable apart where it is heated, leaving the wires at each end all welded together and tapering down to a smooth point. Such an end does not need any wrapping to keep the wires that form the cable from coming apart.

ELEVATOR TROUBLES.

By J. H. Shales.

As a rule troubles arise from lack of attention to the machines, by those in charge. As long as a machine will respond to power, it is let run regardless of its physical conditions. It may have badly worn cables, or rust eaten piston rods, or burnt out contacts, no oil in worm gear, worn out bearings, safety out of order and a host of other infirmities. But as long as it will go up and down, people will use it, jeopardizing their lives and limbs, month in and month out. I have been called in to examine elevators in this city that had been in use for months without having a drop of oil put on the running parts or overhead sheaves. I have seen overhead sheaves bearing cut down through the babbitt and ½-inch into the metal and the shaft scored so that we had to put in new ones. This happens in scores of buildings.

I have one in mind that came under my notice two years ago in a leading hotel within a block of where we are assembled. The manager and engineer's attention had been called to the worn out condition of the machinery, but they thought it could run a little while longer, and so it went on until the armature gave out through over work, and they had to shut down for four days and make repairs, costing them four times the amount that it would have done if they had given it proper care. It is surprising how careless the owners of buildings are about their elevators. And when their attention is called to the need of repair, they will say it should run without looking after, forgetting that iron and steel want looking after as well as the human body.

This brings to mind a case I had some years ago of an electric elevator I had installed in one of our large hospitals. It had been in some months and was giving trouble occasionally through not having a steady operator. On this occasion, as I was leaving the building, I was met by the medical superintendent and was asked if the machine was all right now. I said: "Yes." "Well, how long will it stay that way?" My reply was the Irishman's answer, by asking him: "Doctor are you well now?" Of course he said "Yes." "Well how long will you remain that way?" Needless to say, I was not asked that question again, although I have done the repair on that machine for seventeen years. This is but one of hundreds of thoughtless questions we have to answer in our business.

Fifteen years ago we had great trouble in getting architects to give us room to put in elevators. They thought any old place was good enough for the elevator, forgetting that those machines would need repairs. And through this short-sighted policy it has cost owners hundreds of dollars for repairs which would have been saved if the machine had been placed where they could have been looked after.

NOTICE TO SUBSCRIBERS

Subscribers will confer a favor on us by notifying us in case they are not receiving their paper regularly, or if they find they have missed one or more issues. We send out thousands of copies each month, and it is only natural to suppose that a few copies will go astray in the mails, even though every precaution is taken by us to avoid this.

We should also be notified at once of any change of address, giving both old and new addresses.

In one of our large office buildings we were installing a first class hydraulic plant, and when we came to set up our valves and control machinery, we could not get them in place on account of having a small lavatory in the way. This room is 5x6 on the ground floor with a large lavatory within 20 feet on the same floor. After a great deal of coaxing, the architect gave orders to move the terra cotta wall 18 inches. This just gave us room to get our machines in position. But for the last 18 years, every time there are repairs made the architect is cursed for his folly, as the small room is not used and is of no value to the building for revenue. I have met with instances like this in my 25 years' experience in elevator work.

My advice to all persons in charge of elevators, is to give them the same attention you would give a steam engine, as they are only hydraulic electric engines in the true sense and produce power to operate the cages.

If your plant is an electric one, be sure that all contacts are clean and have good faces. Also that all connections are firm and tight. Those parts should be gone over and tested every day. Also keep an eye on all ropes, overhead sheaves and bearings. Also keep your girder well oiled and car properly adjusted as well as cables tuned up. When this is done on either electric or hydraulic machines, you will be all right.

LOCOMOTIVE SHOP REPAIR JIGS.

Repairing locomotives is a very different proposition from almost any other work I know of, and requires different treatment, says a writer in the American Machinist. Micrometers are an unknown

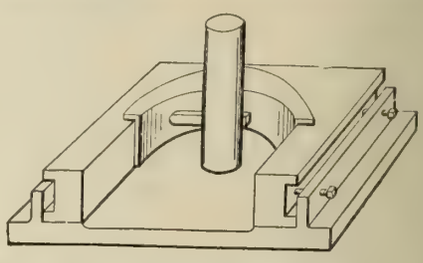

Fig. 1.—Boring Driving Boxes.

quantity in most of the work, yet the results are probably as good as can be expected, when the service is considered. Side rods must have play on the pins, both as to diameter and end movement, varying from 1-64 to 1-32 inch, because the different crank pins are almost never in line on account of frogs, switches and high and low spots in the track. But the main rod has to be as close as it will run cool, on account of pounding out the brass, to say nothing of the noise.

Rebolting a Frame.

When an engine comes in for general repairs and the frame bolts have to be driven out, it's a case of new bolts when the engine is put together again. These bolts have a taper body and drive into the reamed taper holes of the frame. The taper is usually 1-16 inch to the front.

This is usually a case of fitting each

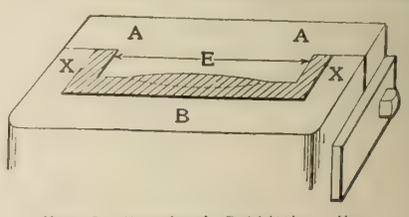

Fig. 2.—Crosshead Babbitting Jig.

bolt to its place, as the holes are just cleaned up with the reamer in the air drill. This fitting has to be well done, as it is very important that they should not work loose.

To do this rapidly, the foreman in charge of this work at the East Buffalo

shops of the Delaware, Lackawanna & Western road has a portable outfit which he sets down near the track the engine is on. This outfit consists of a lathe, a centreing machine and a grinding wheel for sharpening tools, all tied together on on base and driven by an independent motor.

A bright boy completes the outfit and the combination gives star performances when it comes to fitting up a locomotive frame with new bolts. The bolts are centered and the ends all threaded to standard size before the frame has been reamed, and as soon as a few holes are ready the boy gets busy.

He sets a pair of inside calipers to both ends of the first hole to be sure and get the right taper set in the lathe, then he starts in, only measuring one end of the rest of the holes, and turns each bolt to fit its hole. There is no micrometer about it; he just sets his outside calipers by the inside calipers set to the hole, measures by "feel" in the old-fashioned way, and does a good job in a lathe that had seen hard service long before it joined the bolt-turning outfit.

Detecting Cracks in Frames, Rods and Axles.

Every railroad shop has its hair-raising story of axles that have dropped in two on the turntable after a hard run and other cases, all depriving the yellow journals from a prominent display of scare headlines about another wreck, and the best or worst of it is they are true. In no place is the effect of constant vibration better shown than in railroad service, the most prominent defects occuring in frames, rods and axles, all of which are hard to detect unless they are very pronounced. The hammer test helps in many cases where the man is trained for the work, but even this is not infallable.

The master mechanic at these shops, B. H. Hawkins, has introduced a method that is at once simple and efficient whether it is original or not. When an engine comes in for repairs and is stripped, the frames, axles and rods are given a coat of a white water paint. This dries in about an hour and does not rub off readily.

Then, as the wheels are turned up in the lathe, or the frames and rods worked on in any way, or even without it, the oil and dirt that are in any crack in these parts work through this paint and show a dark streak so plainly that it cannot be mistaken. At the time of my visit a driving axle had just been discarded, owing to a slight crack just starting from the round corner of a keyway for the eccentric, and which would never have been discovered in any other way.

The same thing holds good in the other parts, and cracks are constantly discovered that might cause accidents later had they not been found. So a little white paint is probably a life saver when applied in this way.

Boring and Facing Driving Boxes.

Two Bullard vertical lathes or boring mills with a side tool carriage or head, are in use here doing all sorts of face-plate work. The way in which driving boxes are bored is interesting as showing the use to which the side head is put as well as the method of holding and boring.

The lower plate or fixture is bolted to the face-plate, and the driving boxes fit in this and are easily centred and set. A mole in the centre of this plate forms a guide for the pilot on the boring bar, as shown in Fig. 1, holding it steady in its work and insuring a straight cut as well as making high speed possible.

At the same time the side head comes in and faces off the hub lining so that no extra time is required for this work. It makes a neat way of handling work of this kind.

Babbitting Crossheads.

They have the simplest form of babbitting jigs, as shown in Fig. 2, I have seen and they do the work in good shape. They depend on the faces XX of the crossheads C, being planed alike in all cases so far as the distance from one guide to the other is concerned, as well as being the same width on the outside. This allows the fixtures or jigs to be held on the crossheads by the simple clamps, shown at the side, and the babbit fills the opening between the two, being retained at the bottom by an asbestos sheet or pad on which it rests. The crossheads are tinned beforehand, being heated by an oil torch for this purpose.

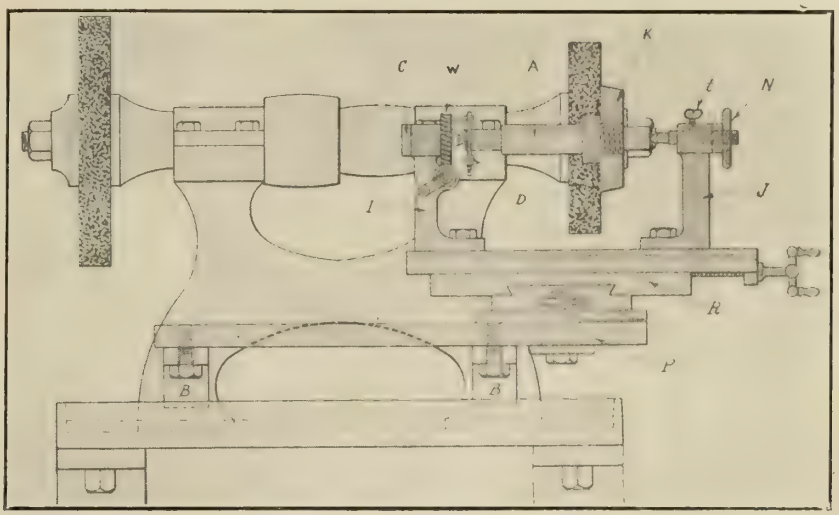
There are several sets of these jigs of different widths at C to allow for guides being planed down on the sides to true them up at different times. These cost very little to make and have been handling all the babbitting done here for some time.

GRINDING CIRCULAR CUTTERS.

By J. H. R., Hamilton.

The accompanying sketch shows an attachment placed on an ordinary emery jack for grinding circular cutters. The shaded portion of the sketch shows the attachment in position.

The piece P is secured to the two brackets BB. On one end of piece P is the compound rest R, the top table of which carries the two centre heads I and J. The arbor A carries the cutter K and is supported between the centres as shown.



Grinding Circular Cutters.

A worm wheel W is secured to the centre in head I and by turning the wheel by the handle and worm the arbor and cutter are revolved on the centres. By removing collar C and putting on a grooved pulley the arbor can be revolved from a shaft overhead.

By the use of jigs in place of the centre head, different small jobs of grinding can be done.

OVERHEAD RUNWAY.

By J. S. Staveley.

For quickly transporting goods patterns, castings, etc., the accompanying sketches show a convenient method of building an overhead runway. Fig. 1 shows the arrangement of the posts, which are "halved" at the point where they cross each other and a plate coach-screwed on the top to take an $1\frac{1}{4}$" bolt which supports the carrying beam.

In order that the C.I. wheels of the "runner" can traverse freely, a $2" \times \frac{3}{8}"$ flat is screwed to the top of the beam,

the heads being countersunk. Where it is necessary to join the beams, the type of joggle joint suitable is also shown.

In Fig. 2 is seen the runner complete, with swivel ring bolt at the bottom. This is convenient for attaching the pulplicates. Attached to the double-armed leader C is a stud upon which is mounted a loose sleeve which travels in, and fits the slot of the templet. As the head is driven along the rail the tool is automatically raised or lowered accordright in London, with employes of the Dennis Wire & Iron Works Co., Ltd., as pupils. If the true "German Peril" be, as claimed, in the struggle for industrial supremacy, this firm is doing its part to avert it.

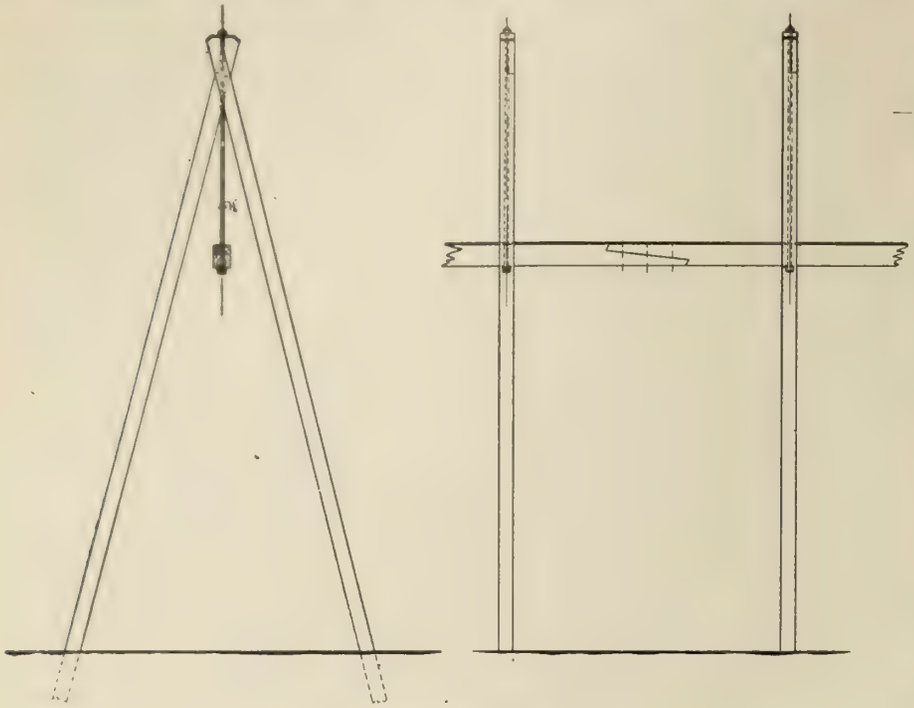


Fig. 1.—Arrangement of Posts.

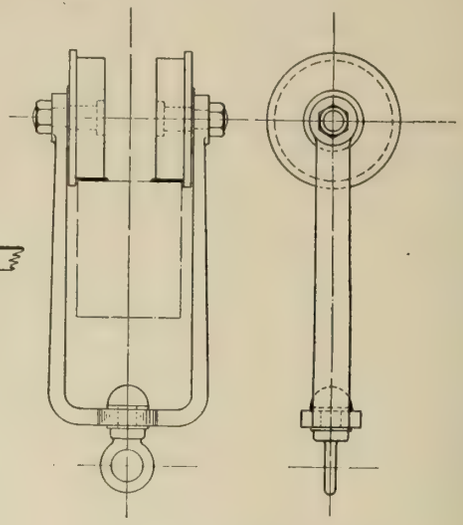

Fig. 2.—Runner Complete.

ley block, and adjusts itself to the direction of pull. It is well to rivet over slightly, the nut ends of the wheel spindle, to prevent them slacking off.

PLANING CURVED SURFACES.

An attachment for planing work of a convex or concave shape is shown in the accompanying engraving. The attachment consists of four parts all of which are of cast iron. These castings comprise the two side pieces or brackets A, the templet B, and the double-armed "leader" C, which is attached to the tool slide. Of course, different templets have to be used for different jobs, the shape of each being governed by the special requirements of the work in hand. The side brackets must be cast with bosses to allow the templet to clear the planer head, so that the latter can move along the rail. As shown, the brackets fit over the top guide on the rail and any slack is taken up by the set-screw shown in the end view. Separate pieces are fitted to the bottom of each bracket which are put in place after the fixture is put on the rail. These brackets are at all times stationary. The templet is worked out on a profiler or slotter, and it is attached to the brackets A by bolts. It should be machined carefully to the required shape, for, obviously, when it is made it will produce any number of pieces which will be exact duing to the formation of the guiding slot in the templet. Of course, when this attachment is in use, the screw of the slide is removed. The fixture is entirely automatic, and when it is in use the cross-feed may be put on, and the planer will take care of the work. This fixture is not new, but there are doubtless many who are not familiar with it.—Machinery.

TECHNICAL EDUCATION IN LONDON.

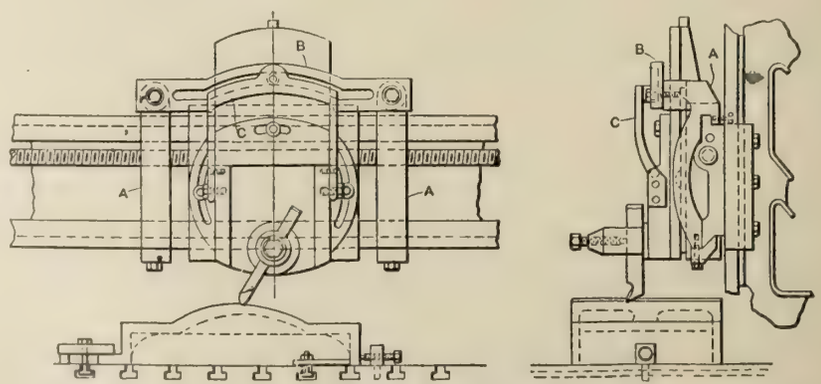
By W. E. Elliott.

While slow-moving Governments and college faculties are talking of the need for technical education, private enterprises has initiated a modest trade school

One hundred men are employed in the Dennis works. Between 25 and 30 have already enrolled in a night class for training in the higher elements of the work in their own factory, and the company has provided a room in the upper part of the works for theoretical instruction.

Here are workmen who make first-class material. Here, also, are a few capable of acting as instructors. Machinery and other equipment is to hand as no trade school has it, with regard to the particular work in which Dennis employes are interested, and the management figure out that the least they can do is provide facilities for those who are ready to be taught.

"The men get their manual training in the day time," says Mr. Earnest R. Dennis, managing director; "and now we are prepared to give them the theoretical part at night."



Planer Attachment Which Automatically Guides Tool in Planing Curved Surfaces.

Mr. Dennis' idea is to secure Inspector Peake and others from Toronto, as well as local experts, to give lectures to the men, from time to time—lectures of Canadian Club quality and Dennis practicability.

"For some time my hobby has been technical education," said Mr. Dennis. "About two years ago I brought the matter up in the Board of Trade, but nothing was done.

"We get good men from England, and also a few from Germany. Some people speak disparagingly of the Englishman, but I tell you they can deliver the goods, thanks to trade schools.

"I have changed my mind about technical schools. I believe now that trade schools are the thing. At Detroit they have the best Y.M.C.A. in the United States. You go in there and find a great plumbing shop, with men making joints and all that sort of thing. They have another big electrical room with dynamos, meters, rheostats, etc. Then they have drafting and carpentering rooms. These things help a man make his living.

"We have the equipment right here for working in iron, and training will make our men worth more to us, and we will pay them more.

"We have a draughtsman whose father and grandfather before him were architects, and he was brought up in a technical institute himself. He is capable of showing these fellows."

In 1876, Mr. Dennis points out, an exposition was held in Philadelphia, and the German Government, always watchful, sent a commission over to see how German students and manufacturers stood, as compared with other nations, as shown by the exhibits. They went back and reported that England and the United States were far in advance. Then the Germans, being practical people, appointed another commission to find out ways and means of remedying the situation. They said, "If you want to manufacture good stuff you have got to have good men, and we need training schools," and so arose the present system of technical education in Germany.

"That was in the neighborhood of 30 years ago," remarked Mr. Dennis, "and now Germany has the most highly organized industrial plants in the world. We have a German manager in our Toronto branch. He is an engineer. 'You talk about militarism in Germany,' he will tell you, 'but it is not militarism—it is law and order, in the business and the home. Everything is done with precision.'

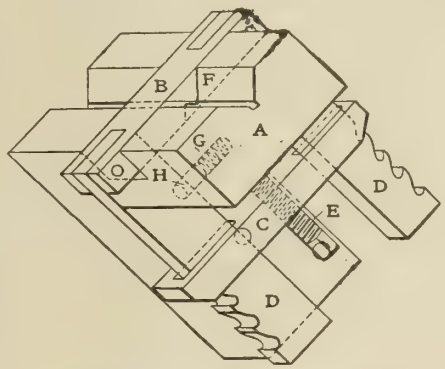
"We had a $10,000 contract for ornamental iron work for a technical school in Quebec," added Mr. Dennis. "If they need one down there, surely we need on in London. A manufacturing concern cannot run ten minutes without labor, and intelligent labor is what we want. We have good material here, if we can only educate them a bit.

"It is awful, you know, when people come in here and ask for a job. I say, 'What can you do?' and the answer is, 'O, almost anything.' When I ask, 'Blacksmithing? Machines? Iron work?' they can do none of these. In this country there is nothing along this line between the public school and the college."

COMBINED ANGLE PLATE AND V-BLOCK.

By G. A. Beaudry.

This device I designed and built for use in my work of die making. The new feature about the tool is the arrangement by which a short screw is used. This short screw will clamp all the different sizes which the tool can take in, that is, from ½-inch up to 4-inch, round or square stock.



Combined Angle Plate and V Block.

A is the body of the tool proper; B is the clamping bar into which a V is cut to correspond with F (the V in the body) and it can be moved forward or back according to requirements. D D are side bars into which are cut a certain number of teeth which catch the ends of the binding bar C and when the screw E is set up against the body A and forces the bar C backward, bar B is pulled back and clamps the work. To move bar B forward take parts D D between the thumb and forefinger and press them together; this releases binding bar C and allows it to be pulled backward and then bar B can be pulled forward so as to admit the stock. G is a coil spring and H is a pin set in the body A on each side to force rods D apart so that they catch on the ends of binding bar C; then a few turns of screw E will clamp the work solidly. This appliance can be clamped on the table of a drill press or on the face plate of a lathe or grinding machine.—American Machinist.

A CO-OPERATIVE SYSTEM.

In the year 1825, Charles Allen, a native of Andover, Vermont, settled in Waterloo, Que., and there worked as a blacksmith. A few years later he formed a partnership with Daniel Taylor, a native of Newfane, Vermont, to carry on the business of blacksmithing and cloth dressing. That partnership continued until 1858, when Mr. Taylor died. In 1861 a new partnership was formed, and a son of each of the former partners was admitted into the company. Charles Allen died in 1881, and his second son became a member of the company.

This firm is still carrying on the business of machinists and dealers in general merchandise, their general store being started by them in 1839.

D. L. Allen commenced working as clerk for Allen, Taylor & Co., in 1861, and was admitted a partner in 1881. The general merchandise business has been carried on in the same store for seventy years.

The Waterloo (Que.), Iron Works, the manufacturing end of the company's interests was started by Charles Allen as stated above. The works have been in continuous operation eighty years. The works and the store are now being conducted by the third generation with the exception of D. L. Allen, who is of the second generation.

Owning both works and store, it is an easy matter for these two institutions to work together. The employer and employe exchange work for merchandise, the co-operative system followed being very simple. It is not compulsory for a workman to deal at the general store of Allen, Taylor & Co., but it is made very easy for him to do so.

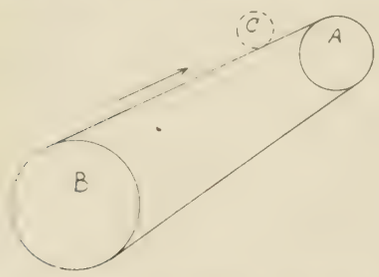
If a workman decides he will deal with the company for whom he works, he is furnished with a pass book in which is entered the purchases made at any time. At the end of the week the pass books are checked up. The amount of purchase is treated as an advance payment, and is deducted from the total wages due the workman. The balance due him is placed in his envelope. The system is found to work satisfactorily and is beneficial to both workman and proprietors.

Correspondence

Readers are invited to send in replies to answers asked under "Correspondence," and these will be paid for at regular editorial rates. Anyone desiring the names of firms manufacturing certain lines will be answered under this heading. Comments on previous articles containing good ideas will be paid for.—Editor.

Position of Belt Tightener.

Will a reader please inform me the proper place to put tightener on a main driving belt, as shown in the illustration. A is the driven pulley on line shaft. B is the driving pulley on the engine. The arrow shows the direction in which the belt runs.



Where Should the Tightener be Placed?

CENTRE PUNCH.

The dotted circle C shows the suggested position for the belt tightener. In addition to tightening belt, it will give a larger belt contact on the small pulley if placed close to it.—Editor.

* * *

Boring Deep Holes.

I have some castings in which deep holes must be bored, and I find it very inconvenient. Are there not some methods for boring, without having to withdraw the drill every few turns to remove the cuttings?

SUBSCRIBER.

In the Feb., 1908, issue, Canadian Machinery, is an article on this subject by John Edgar. Hollow drills may be obtained from the manufacturers of twist drills advertising in Canadian Machinery, and it is comparatively a simple matter to use a hollow drill and lubricate the work. One method is to attach a hollow tube of less diameter than the hole. Feed in the lubricant through the centre and the chips will be carried out along the flinted sides and out along the outside of the hollow tube.

If the work to be bored is firmly chucked and runs true in a rest, and the boring bar is held rigid in the lathe rest, great accuracy may be obtained.—Editor.

* * *

Rust on Metals.

We store away iron and steel, but as the storehouse is a little damp the bars rust. Will you recommend a preventative for rust—READER.

Answer—A coating of sperm or lard oil will prevent rusting. Do not use lubricating oil. A box of lime placed near the steel will absorb dampness.—Editor.

* * *

Lignum Vitae.

Where is lignum vitae obtained.

B. C. SUBSCRIBER.

Guaiacum, Brazilwood, or lignum vitae is obtained in the American tropics, and is remarkable for the hardness and heaviness of the wood. We would appreciate receiving the address of a Canadian or United States company handling lignum vitae.—Editor.

* * *

Vulcanizing Rubber Tires.

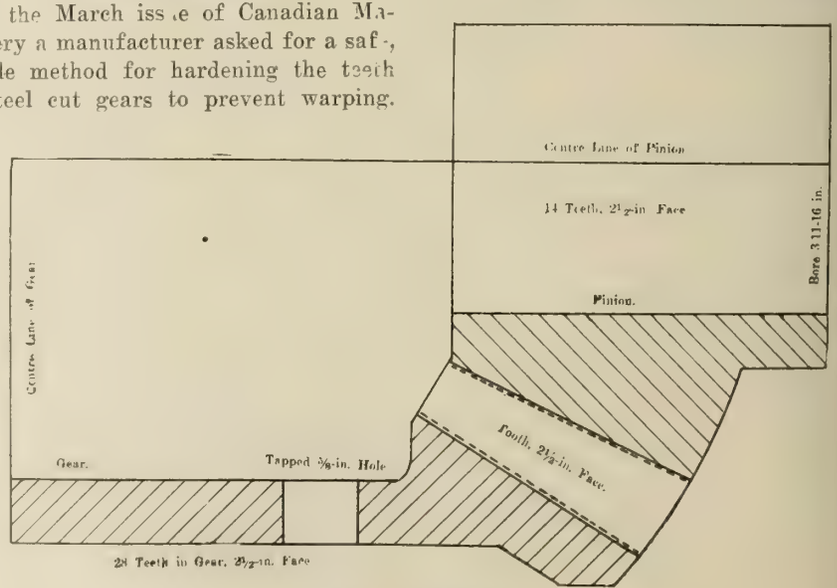
How can I vulcanize automobile rubber tires so that after vulcanizing the rubber will again be brought to its normal elasticity. I find that after I heat the rubber to its melting point, it is completely spoiled, and the reason is probably because I am not using the right process. Will a reader of Canadian Machinery give the correct method through this paper.

MILDMAY.

* * *

Tempering Gears.

In the March issue of Canadian Machinery a manufacturer asked for a safe, simple method for hardening the teeth of steel cut gears to prevent warping.



Gears to be Tempered.

Herewith is given a sketch and suggestion for hardening them will be appreciated and paid for. The teeth are to be hardened one-sixteenth of an inch on the surface. There is no furnace in which the gears can be placed, except a small brass furnace, which has a diameter of about 15 or 16 inches. It is necessary that these gears run perfectly true, as they run at high speed.

* * *

British Locomotives.

Are there any locomotives of British manufacture running on the railways of Canada. I undestand there are some Scotch locomotives in Lower Canada. Will readers please send this information.—C. E.

5th ANNUAL BANQUET OF G.T.R. APPRENTICES.

An excellent toast list was provided at the fifth annual banquet of the Grand Trunk apprentices, Stratford, on March 15, and the addresses given were listened to by nearly all the members of the club and their friends.

The toast to the "G. T. R." was responded to by Master Mechanic, J. G. Markey, Toronto; "The Local Shops," W. Seeley, and "The City," by Mayor Dingham and W. Preston; "Apprentices," W. Margett, "Ex-apprentices," E. R. Dalley.

Prof. Angus, of Toronto University, was on hand, and replied to the toast of "Educational Facilities," as did Principal Mayberry and W. Walton. "Our Teachers," by E. Meldrum; "Visiting Apprentices," L. Andsky, P. Drummond and E. Thorpe, of Montreal; "Athletics," H. Humber, and "The Ladies," H. Walton.

The Grand Trunk band discoursed several selections, and solos were rendered by J. G. Sarvis, H. Genson, A. Kelso, W. Bryanston and A. Walton.

POWER GENERATION AND APPLICATION

For Manufacturers. Cost and Efficiency Articles Rather Than Technical.
Steam Power Plants ; Hydro Electric Development ; Producer Gas, Etc.

BELTING OF HALF COTTON AND HALF LEATHER.

In a discussion of lineshaft efficiency in the proceedings of the American Society of Mechanical Engineers, W. F. Parish, Jr., points out that for comparative tests made under work-shop conditions it is advisable to have the belts made up half of cotton and half of leather, thereby eliminating the effect of humidity, which may cause variations of 12 per cent. in the power delivered.

An English firm five years ago purchased a cotton belt to drive a dynamo, but this belt was not equal to the speed and power required of it, so a leather belt was substituted. It was decided to use the cotton belt on one of the main mill drives, but it was found to be much too short. So a piece of leather belt was spliced in, the whole being, when finished, half leather and half cotton. A casing was built under it, as it was low down and in a dangerous position. The manager was annoyed to find that this casing had been built too close to the belt, no allowance being made for sagging.

The dampness greatly affected the leather belt, as the drive was in a low part of the mill, but the casing under the patched belt was never altered. The length of the belt never varies whether the weather is damp or dry, and it is the best belt drive in the mill for steady work. Moisture has an opposite effect on leather and cotton, leather lengthening and cotton contracting with an increase of humidity, so that in the half-cotton and half-leather belt the weather effect is practically compensated for.

VACUUM CLEANERS IN INDUSTRIAL PLANTS.

The vacuum cleaner has been developed with much aggressiveness by its various builders, and has now become of recognized utility in industrial as well as residental life. The modern shop and factory are well ordered institutions, and cleanliness is a prime requisite.

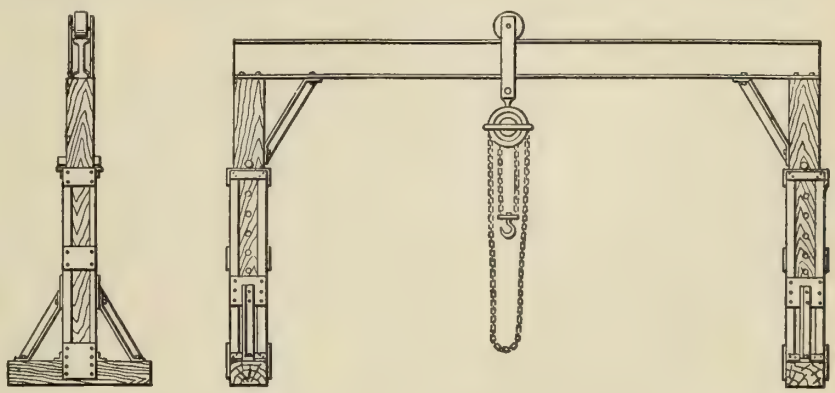
The vacuum cleaner is a most complete remover of dust and dirt and finer debris of all sorts. The vacuum system of cleaning promises exceptional usefulness in ridding works of those kinds of dust which are injurious to the health of employes. The manufacturers believe that they can be of great service to factories which do wet grinding, by collecting the dried sediment of particles of abrasive and metal.

Where an exhaust system is installed, the apparatus is designed to be attached at conveniently spaced stations. The self-contained unit, with an electric motor attached to the fan, can be employed in any works having electric wiring. The blower and exhaust have a great usefulness, extending over a wide field. The vacuum cleaner is an addition to the scope of effort, which will undoubtedly be adopted quite generally in the next few years.—Iron Age.

HOME MADE ERECTING CRANE.

By Charles Collins.

Recently I happened to be where a new light and power plant was being installed. As the parts of the machines were cumbersome and heavy to handle the erecting crew were provided with a light and handy portable traveling crane of home-made construction, which seemed to be the acme of convenience.



HANDY HOMEMADE ERECTING CRANE

It consisted of a ten-foot length of I-bean supported by two 6x6-inch timbers, which telescoped into light, well braced frames of angle iron, thus permitting the beam to be raised to a height suitable for the job. A traveler and a chain tackle completed the outfit.—American Machinist.

POWER TRANSMITTED BY BELT.

By H. D. Chapman.

The power transmitted by a belt is directly proportioned to its speed. A safe rule is:

Allow one h.p. for a speed of 1,000 feet per minute, with a belt of single thickness, 1 inch wide.

This is a more liberal allowance in favor of the belt than is usually given, but will increase its life in far greater proportion than the increase in first cost.

Double belts will transmit about 1½ times as much power as single belts.

This rule applies to belts running over pulleys of equal diameter, or where the arc of contact is 180 degrees. For smaller arcs of contact, use the coefficients found in the following table:

Deg.	90	100	120	130	140	150	160	170	180	200
Coef.	0.65	0.70	0.75	0.79	0.83	0.87	0.94	0.97	1.00	1.00

To increase the power transmitted, either increase the speed of the belt by using larger pulleys, or use a wider belt.

Example. A 3-inch, single belt is running over a 24-inch driving pulley, which makes 200 revolutions per minute. How many h.p. will it transmit?

The circumference of the pulley in feet is $2 \times 3.1416 = 6.2832$ feet.

As the speed of the pulley is 200 revolutions per minute, the speed of the belt will be $200 \times 6.2832 = 1256.64$ feet per minute.

For every inch of width it will transmit $1256.64 \div 1000 = 1.25664$ h.p.

Then, a 3-inch belt will transmit

$3 \times 1.25664 = 3.76992$ h.p.

If it is desired to increase the power in the above example to five h.p., it may be done by using a wider belt in the proportion of 3.75 to 5, or in reality a 4-inch belt. The same thing could be effected by increasing the size of the pulley in the same proportion, or

3.75 : 5 :: 24 : 32.

It would thus require a 32-inch pulley. A double belt of the same width would transmit 1½ times as much power or $1.5 \times 3.75 = 5.63$ h.p., which would be a little more than the required five h.p. — Power.

CANADIAN MACHINERY
AND MANUFACTURING NEWS

A monthly newspaper devoted to machinery and manufacturing interests mechanical and electrical trades, the foundry, technical progress, construction and improvement, and to all users of power developed from steam, gas, electricity, compressed air and water in Canada.

Vol. VI. April, 1910 No. 4

TARIFF AGREEMENT.

Much to the satisfaction of the people of United States and Canada, a tariff agreement has been amicably arranged. Canada has conceded lower duties on thirteen items, and in return receives the benefit of the United States minimum tariff. The items cover food stuffs such as dates, figs, nuts of all kinds, etc; soaps, toilet preparations, window glass, watch actions, feathers, etc. The reduction amounts from about 2½ to 3 per cent.

In connection with the tariff arrangement, there is a reciprocity offer, President Taft proposing negotiations looking toward the establishment of closer relations between United States and Canada. Any movement in the direction of broader and closer commercial relations will receive the hearty support of the large majority of the people of these two countries.

Canadian manufacturers are in hopes that when the representatives of the two countries meet, the subject of reducing the tariff on machinery not made in Canada should be considered. At the present time there are a great number of machine tools not manufactured in Canada and Canadian plants are at a disadvantage on account of the high initial outlay necessary when certain machines are required.

Take the automatic for example. The machine costs probably $1,500, fo.b. place of manufacture. The duty is 27½ per cent., bringing the total cost up to $1,912.50. This includes only one set of tools and many are required which the user must make himself at great risk of inaccuracies on account of all toolmakers not being familiar with the automatic. Otherwise, he must pay heavy duty on the necessary tools. We have not considered the freight in the above figures.

It is manifestly unfair to place the Canadian manufacturer at such a decided disadvantage in regard to shop equipment, when the machines cannot be obtained in Canada. This applies not only to automatic machinery, but to cylindrical grinders, gear cutting machinery and numerous others. If the Canadian manufacturer is to be the factor in the world's market that he should be, he should receive all the assistance possible to compete with other manufacturers placing similar lines on the market.

ONTARIO BOILER LAW.

For a number of years manufacturers and users have been working towards the adoption of uniform boiler regulation in the various provinces. At a meeting in Regina in December, 1909, representatives of the various provinces met and discussed regulations which would be acceptable to the several provinces.

At the recent session of the Ontario Legislature a bill was passed respecting steam boilers. As the bill states, the regulations shall come into force at such a date as is deemed advisable. The following are the provisions of the Ontario Boiler Act:

1. This Act may be cited as "The Steam Boiler Act."

2. In this Act "steam boiler" shall mean a boiler used for generating steam for heating and power purposes, and every part thereof or thing connected therewith, and apparatus and things attached to or used in connection with any such boiler, but shall not include a boiler used for heating water for domestic purposes or a railway locomotive or steamboat boiler.

3. Upon the recommendation of the Minister of Public Works the Lieutenant-Governor-in-Council may make such rules, regulations and specifications as may be deemed proper respecting the construction of steam boilers, including the materials to be used, the method of construction, the tests to be applied, the inspection of the boiler during its construction and before it is permitted to leave the place of construction, and generally such other matters as may secure a uniform standard of strength, safety and efficiency.

4. The rules, regulations and specifications shall be published in the Ontario Gazette and shall come into force and take effect at a date to be named by proclamation.

MR. FOSS AND RECIPROCITY.

The election of Eugene N. Foss to the United States Congress marks a long step towards securing fair trade between United States and Canada. Reciprocity has been a hobby of Mr. Foss' for years and his policy, "Canadian Reciprocity and Tariff Reform," has won for him a notable victory in a constituency which had always voted Republican.

E. N. Foss is president of the R. F. Sturtevant Co., Boston, whose blowers and ventilating apparatus are known the world over. Mr. Foss' creed is thus summed up :

"Reciprocity with Canada is not a question of a year or a day. It is one for the statesmanship of the future, and it is to the interest of both countries to have this question settled intelligently and upon broad lines, which will permit to both countries the highest development of all their resources. Reciprocity accomplished, contemplates the extension of American conditions to Canada. These have made the United States the most prosperous country in the world, and they will make a prosperous Canada."

Mr. Foss' victory should go far in bringing about the realization of his creed.

CANADA'S GROWING TRADE.

The total trade of Canada for February, 1910, was $46,291,201, an increase of $8,202,374 over February of last year.

For the eleven months of the fiscal year the total trade has been $610,577,981, an increase of $104,113,307, or over 20 per cent., as compared with the corresponding eleven months of the last fiscal year, and constituting a new record for Canadian trade.

Imports for the month totaled $30,341,462, an increase of $7,152,794. For the eleven months the imports totaled $332,391,669, an increase of $68,131,239.

Exports of domestic products for the month totaled $15,337,043, an increase of a little over one million. Exports of domestic products for the eleven months totaled $257,012,262, an increase of $32,805,650. Of this latter increase, about seventeen millions was in agricultural exports, about seven and a half millions was in exports of the forest, and about two millions in exports of manufactures.

Exports of foreign products for the eleven months totaled $21,174,050, an increase of a little over three millions.

The total customs revenue for the eleven months was $53,781,333, an increase of $11,389,085.

The monthly financial statement of the Dominion shows an increase of $1,606,751, as compared with February, 1909, and an increase of $14,179,638 for the first eleven months of the present fiscal year, as compared with the corresponding period of last year. The total revenue for the eleven months has been $89,684,460. When the books are finally balanced for the year it is expected that the revenue will run very close to the hundred million mark, and will exceed by a million or so Hon. Mr. Fielding's conservative estimate in his budget speech of December last.

The expenditure on account of consolidated fund for the eleven months has been $63,876,584, a decrease of $3,127,898. On capital account the expenditure has been $29,989,535, a decrease of $9,312,567.

The net public debt at the end of February was $328,658,879, a decrease during the month of $1,211,090.

GOOD TIMES AT CANADA FOUNDRY.

"I have been authorized to announce that, dating from March 1, 1910, a general increase in wages of five per cent. will be made to all the works' employes of the Canada Foundry Co., Limited, who are on an hourly basis.

"The management recognize the harmony that has existed between themselves and the employes during the dull times, and take the earliest opportunity afforded by improved prospects of showing their appreciation in a practical manner."

This is the notice which the 1,000 employes of the Canada Foundry Co. saw posted in the works on March 1. The total amount of wages affected upon which five per cent. increase will accrue will be between $12,000 and $13,000 weekly. The increase means, therefore, $600 or $650 a week.

This action in asking the employes to share in the prosperity the company has enjoyed is an encouraging sign of the times, indicating, as it does, the hopeful view the directors of the company take in the future. It augurs well for the cordial relationship between employer and employes. Having a reputation for fair dealing with employes or customers is one of the greatest assets a company can possess.

CANADIAN MACHINERY IN THE WEST INDIES.

It will, no doubt, be of interest to our thousands of Canadian readers, that mechanical men in the West Indies are also interested in the Canadian Machine Shop and Foundry paper. David Williams, one of the best known of our large staff of circulation representatives, has been visiting the West Indies for the past three months, and he writes that Canadian Machinery is taking well among the reading class of mechanical men, and that all appear anxious to keep in touch with Canadian practice.

Writing from British Guiana, Mr. Williams reports securing fifteen subscribers to Canadian Machinery, as a result of his first few days' work there. He will remain some time yet in the West Indies and British South America in the interests of the MacLean papers. What is being done in the south is being done in Canada.

Three new salaried circulation men started work on the MacLean papers on April 4, in addition to a number of local shop agents. It is the intention of the MacLean Publishing Co. to keep pace with Canada's industrial growth, and this can only be done by increasing the staff. As soon as capable men can be secured other additions will be made to the circulation staff.

DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

SLOTTING ATTACHMENT.

There are many times when a slotting attachment can be used to advantage on a milling machine. This is especially true of the tool room miller, as much time can be saved on slotting boring bars, dies, wrenches, internal gears, keyseating, etc.

In the attachment illustrated herewith, the adjustment of stroke is easily effected. The ram is a rectangular steel bar carrying at its lower end hardened V-jaws in which to clamp the slotting tool.

The tool can be of any form or shape, rough or finished. The form of ram permits of a long bearing relative to its width which ensures rigidity and alignment.

The cutting stroke is one half the speed of the return, greatly increasing the output. The ram can be swiveled through the entire 360 deg., making it possible to hold work in the chuck on the dividing head in a horizontal position and cuts taken, using the head for indexing on such work as a hex socket wrench, internal gears or anything of this character that cannot be done accurately by other means.

The return is effected through the driving shaft which has a T-slot cut through its front end to receive the adjustment bolt. This bolt is adjusted with a wrench, an opening being provided for this on the right hand side. Adjustment of stroke is provided from 0 to 4 inches.

The driving shaft has a groove in which is fitted a bronze block that is driven by a collar directly on the main spindle of the machine. The centre line of the driving shaft is above the centre line of the spindle, a distance sufficient to give a quick return of two to one as before mentioned.

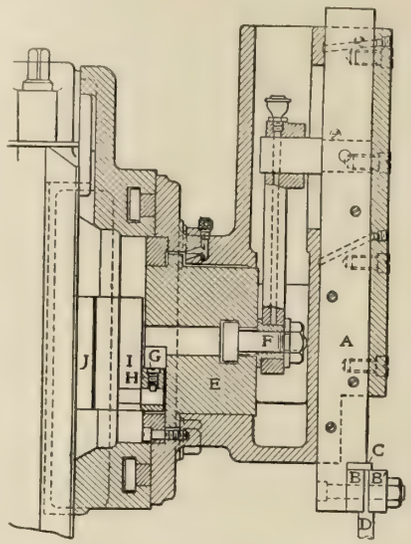

Fig. 3.—Details of Slotting Attachment.

Milwaukee Milling Machines are all constructed with the knee slide carried upward to the over-arm, the primary object being to securely hold attachments such as this.

The attachment could be used in connection with rotary table, as shown by photographs for any work requiring slotting and indexing as, for instance, internal gears or anything of that nature. It can also be swiveled to a horizontal position and used in connection with universal centres for similar work where rotary table is not available.

The oil tubes for conveying lubricant to the cutting edge are regularly supplied on all of their milling machines, none being made without them.

The details are shown in Fig. 3. The ram A is a rectangular steel bar, and carries at its lower end V-blocks BB1 with a hardened piece C to back up the tool. The tool D can be of any form or shape, rough or finished. This form of ram permits of a long bearing relative to its width, which insures stiffness and better alinement.

The return of two to one is effected through the driving shaft E, which has a T-slot cut through its front end to receive the adjustment bolt, F. This

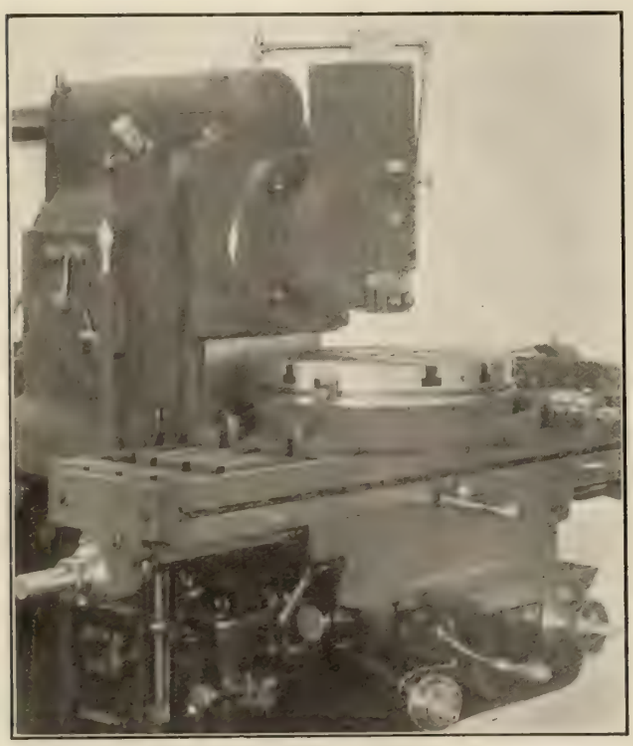

Fig. 1.—Slotting Attachment on Kearney & Trecker Milling Machine.

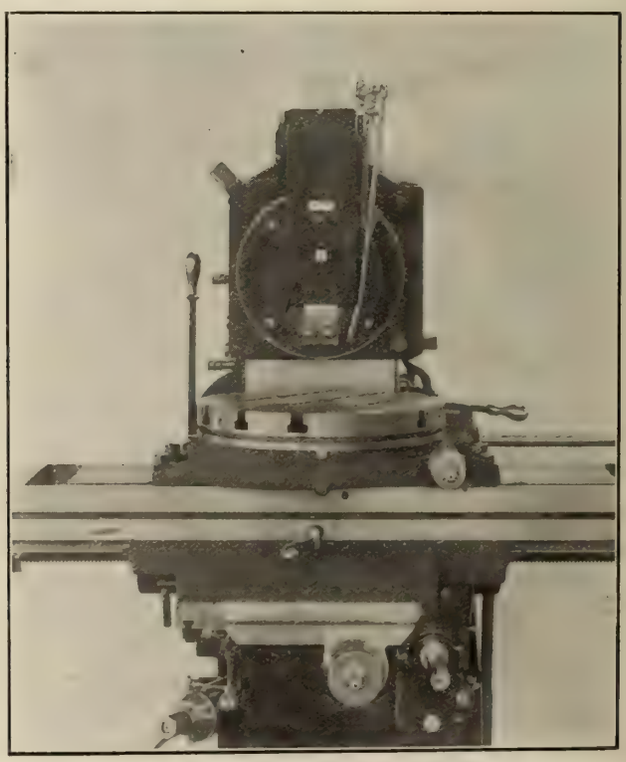

Fig. 2.—Slotting Attachment on Kearney & Trecker's Milling Machine.

bolt is adjusted with a wrench, through an opening on the right-hand side.

The driving shaft E has a groove GG, carrying a bronze block H, that is driven by the collar I directly on the main spindle of the machine. The centre line of the driving shaft E is above the centre line of the spindle J, a distance sufficient to give the quick return.

These milling machines are made by the Kearney & Trecker Co., Milwaukee, Wis.

UNIVERSAL MILLING MACHINE.

The new style Universal Milling Machine illustrated herewith shows several changes in design including the feed box, the dividing head and changes in the machine. The photos show the large proportions of all the main parts and an unusual design for simplicity and rigidity.

The automatic feeds to the table are transmitted from the spindle through a roller chain to the sprocket wheel of the feed box. On the sprocket shaft rides a sliding gear on which are mounted two other gears; these gears are shifted by means of the lower lever on feed box, so as to engage other gears which are secured to the intermediate shaft. On this intermediate shaft are also secured a cone of gears into any one of which the intermediate tumbler gear is engaged. From the tumbler gear shaft the power is transmitted through the universal joint to the gears on the knee and there the automatic longitudinal, cross or vertical feed is engaged. The gears in feed box run in oil, provisions are made so as to readily drain the oil and put in clean oil. A direct reading index plate is attached to the feed box from which

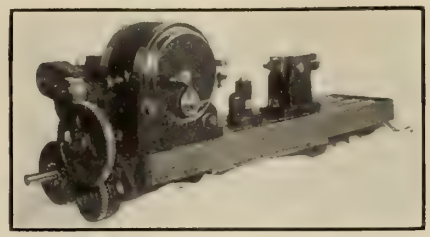

Fig. 3.—Details of Dividing Head.

the exact amount of feed per revolution of spindle is read.

The elevating screw is provided with ball bearings which insure ease of operation. This screw does not extend below base when at its lowest point.

The nose of the spindle is slotted to

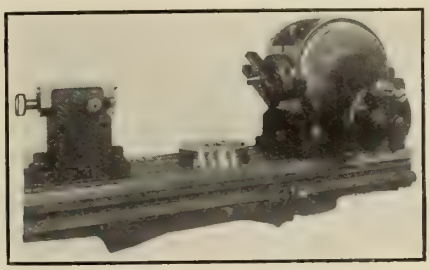

Fig. 4.—Details of Dividing Head.

positively drive arbors and other tools.

The universal head is designed for dividing work in any position from 10 degrees below the horizontal to 10 degrees beyond the perpendicular. It is furnished with dividing mechanism for spiral cutting and has several noteworthy features.

This head can be securely clamped in any position by two bolts with V-blocks, turned to the same radius as the V on body, which are such a distance apart as to make it very rigid.

The dividing crank is fitted on the worm shaft, thus eliminating the gearing when used for dividing. A half turn of the engaging crank disengages worm from wheel.

One of the features of this head is the quick spacing device to divide work in 2, 3, 4, 6, 8, 12 and 24 divisions. The spindle spacer consists of 24 holes drilled in the worm wheel and the front shoulder of spindle has 24 graduations in plain view, which graduations are in line with holes in worm wheel. The spindle spacer pin is hardened and the point is tapered, it is actuated by a crank.

The worm shaft and worm are made in one piece of tool steel, and the worm wheel is made of bronze.

To compensate for any wear that takes place between worm and worm wheel, there is provided an eccentric bush. This raises the engaging crank and consequently the worm.

When using the universal head for dividing work the sleeve and plate are held stationary by locking the sleeve to trunnion.

The spindle can be very efficiently clasped by a wedge pin with a 60 degree angle milled on one end to fit 60

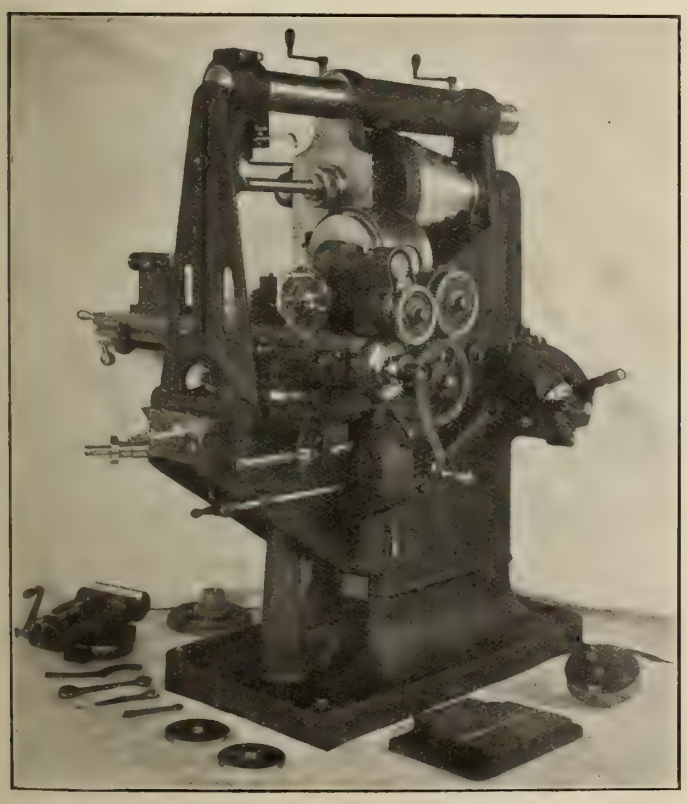

Fig. 1.—Oesterlein Milling Machine.

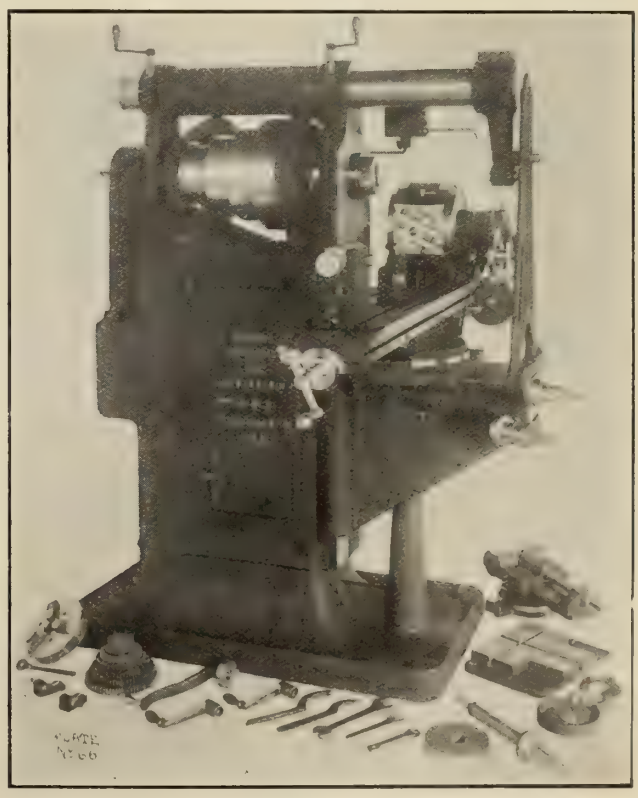

Fig. 2.—Oesterlein Milling Machine.

degree groove turned in spindle. This wedge pin is operated by the screw shown in Fig. 3. The crucible steel spindle has a taper bearing its entire length and any wear is readily compensated by means of a split nut on back of spindle.

To rotate the work for spiral cutting connection is made to the lead screw by gearing shown in Fig. 3.

With this head goes a complete set of change gears, three dividing plates, a tailstock and centre rest. These 3 plates will index all divisions up to 100, all even and those divisible by 5 up to 200 and many others.

The plain head shown in Fig. 4 is the standard head for plain milling machines. It will do all work the universal head will, except spiral cutting.

The tailstock is so arranged that it can be swiveled to any angle necessary for milling taper work. It has an efficient clasping device for the centre.

This Universal Milling Machine is made by the Oesterlein Machine Co., Cincinnati.

SELLS ROLLER BEARING.

The Sells roller bearing herewith illustrated and described is being sold by the Royersford Foundry & Machine Co., Royersford, Pa. It is the design of John D. Sells, for many years identified with the "Standard" roller bearing, and is therefore the product of a long experience in this line of work. This bearing is universally adaptable, can be applied to any hanger or pillow-block of corresponding size either for new installations or for substituting in a plant previously equipped with the old style of plain or oil bearings; and it also possesses the advantage of being applicable without requiring to be pushed on over the length of the shaft from one end to the other.

The construction is as follows: First the split sleeve is put on the shaft. This is formed in two parts, with the split running diagonally, so that the rolls may pass over the joint without shock or irregularity of motion. Next this sleeve is clamped in place onto the shaft by two collars, which are provided with counterbores fitting the edges of the sleeve so that they are thus themselves truly located. Next the two halves of the split cage are placed around the sleeve between the collars. Then, as shown in Fig. 2, the box itself is put over the whole and fastened. The application of the bearing will thus be seen to be as simple as the application of a split sleeve or wood pulley.

The bushing is of hardened steel, and absolutely protects the shaft from being cut or scored by the case hardened steel rollers. Injury from this cause is of common occurrence in other designs. These bushings are so constructed as to vary in thickness, allowing the same size of bearing to be fitted to different diameters of shafts. Each roller cage structure is adapted to three such changes of bushings. This makes it unnecessary for the dealer to carry a large stock of these bearings, as odd-sized bushings will take care of the intermediate sizes.

The rolls, as shown are contained within a roller structure or cage. This separates them from each other, and eliminates the friction caused by the rolls running in contact. It also holds them parallel to each other so that it is impossible for them to get cramped diagonally in the boxes.

This bearing is of the full floating type, so that none of the customary trouble from end-thrust friction in roller bearings is met with. The two halves of the case are fitted together with milled joints to make them dust-proof, and to give further assurance in this matter a heavy felt wiper is used at each end of the box, which at the same time prevents the loss of oil. Drain holes are also provided so that the case can be flushed with kerosene or other cleansing fluid when the oil gums. Holes are tapped in the top of the box to provide for oil cups. For head or jack-shaft use, on shafts 3 11-16 inch diam. or larger, this bearing is provided with a double roller structure shown in Fig. 1. This gives a greater bearing area for heavily loaded shafts. All parts are made interchangeable. In case any part of the bearing becomes mislaid or broken by accident, it can be easily replaced, thus avoiding the expense of a new complete bearing. For the present the manufacturers intend selling these bearings at fifty per cent. less than that asked for any similar device on the market.

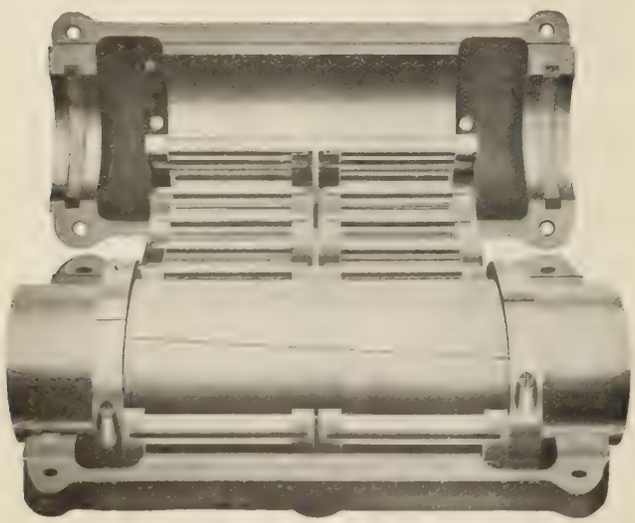

Fig. 1.—Sells Roller Bearing of Double Cage Type.

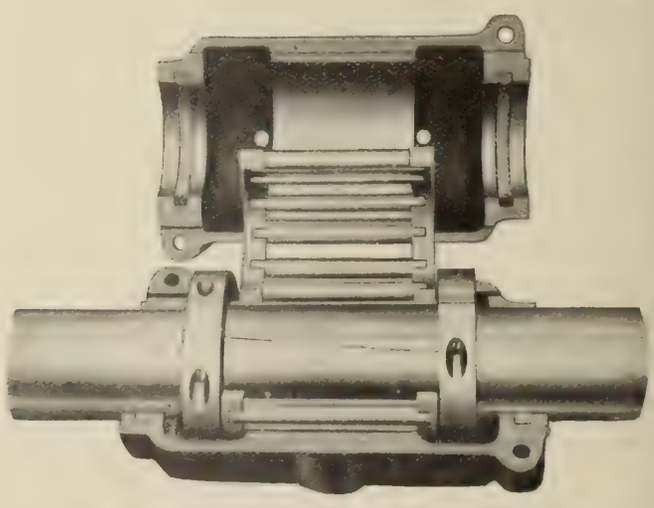

Fig. 2.—Sells Roller Bearing of Single Cage Type.

OIL AS AN AUXILIARY FOR OPEN HEARTH FUEL.

By G. P. Blackiston.*

The great shortage of the natural gas supply on the one hand and the frequent delays of coal deliveries on the other, due to severe cold weather as experienced this year, has made some of the slower thinking manufacturers realize the great necessity of being provided with some auxiliary method of heating. This is especially true in the open hearth practice, where a sudden shut off of fuel would often mean not only a delay but a total loss to both the furnace and its charge—the furnace being out of commission for many weeks at the least.

This being the case, many of the largest plants have been equipped with an auxiliary heating system.

The problem has been, however, how to secure an equipment that would give

* Formerly Superintendent of Open Hearth Furnaces Howe-Brown Steel Co., Pittsburgh.

satisfactory results without necessitating any changes in the operation or construction of the furnaces—also one that would not interfere with the floor space and be capable of being installed in the narrow spaces between the ends of the furnaces.

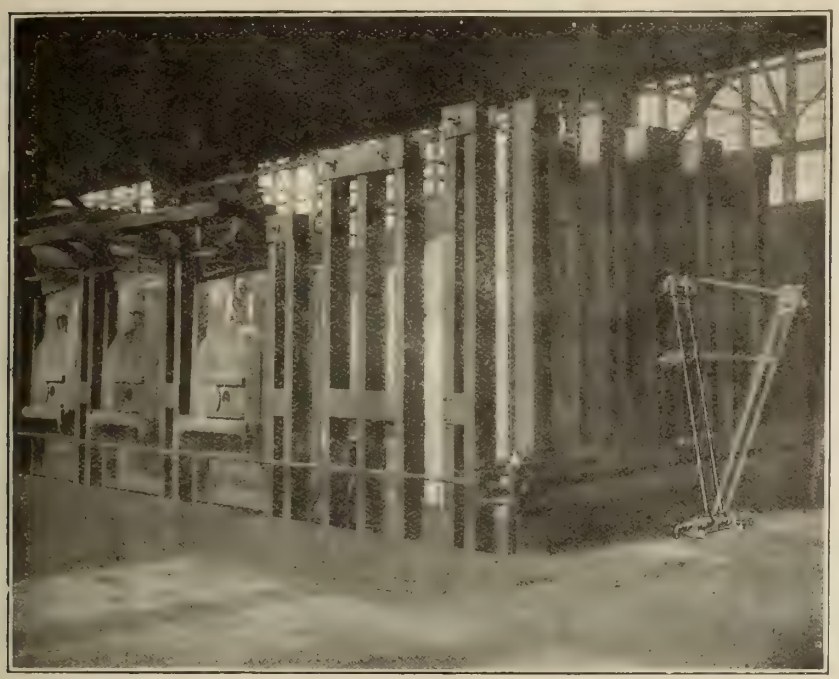
After considerable experimenting a device was designed and placed upon the market by Tate, Jones & Co., Inc., Pittsburgh, Pa., that fulfilled all the severe requirements. At either end of the furnace a burner is installed, each being properly mounted on a swinging stand located on exterior of furnace to admit of one burner being swung into place (into the parts of furnace), and the other swung out and turned off as the furnace is reversed. The design of the burner is such that the supply of oil and compressed air or steam for atomizing is regulated by one lever, the ratio between the atomizing agent and the oil always remaining at a constant point, which has been found to be the proper proportion for complete atomization.

This adjustment is scientifically made and fixed before the burner leaves the factory, so that an efficient fire is always maintained.

Necessary valves are provided on the burner stand for cutting off the oil and atomizing agent, when it is necessary to remove the burner from the stand. The oil and atomizing agent are controlled from the charging floor.

An oil pumping, heating and regulating system is also used for drawing the oil from the storage tanks, straining the foreign matter and lumps from it, raising the temperature to facilitate atomization and feeding it to the burner under a uniform pressure.

Oil is fed to the burner by this means under a pressure of from 35 to 50 lbs. and a small quantity of compressed air or steam for atomizing the oil is supplied at a pressure from 5 to 10 lbs. less than the oil pressure. Either steam or compressed air may be used for atomizing, as determined by local conditions. The oil lines from the pumping system and the compressed air or steam lines are run to the charging floor where special controlling valves are provided, as indicated above, and the additional reducing valves are introduced in the air or steam line for cutting the compressor or boiler pressure down as required.



The Kirkwood Oil Fuel System as Applied to Open Hearth Furnaces.

Throwing in Kirkwood Oil System When Gas has Given Out.

The burners when not in use are thrown back (out of the ports), from the ends of the furnace. When the regular fuel supply gives out, one of the burners is merely thrown forward, and the valves on the regulating stand opened with a continuation of the melting.

By this method all danger of a shut down on account of shortage of fuel is absolutely minimized. Several of the largest plants in the Pittsburgh territory were thus spared this winter on more than one occasion.

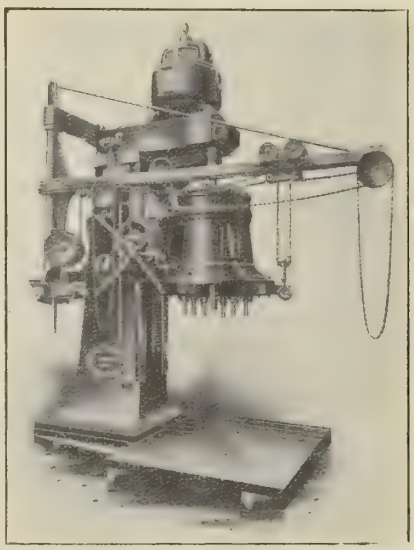
COLLAPSIBLE STEEL HORSES.

S. M. Hildreth, 2 Rector St., New York City, are placing on the market a collapsible steel horse or trustle. They are made from angle iron and are very rigid. The legs fold up when the trestle is not in use. They are useful for carpenters, contractors, machine shops, manufacturing plants, etc.

MOTOR DRIVEN MULTI-SPINDLE DRILL.

A motor driven multi-spindle drill is shown herewith, the placing of the motor being of special interest. It is a vertical type, variable speed, 550 volt direct current motor, 12 h.p. 300 to 1,200 r.p.m. with ball bearings.

The drill is a six spindle drill for repetition work and is of substantial design and build, being one of Craven Bros., Manchester, manufacture.



Vertical Type Motor Driving Multi-Spindle Drill.

The motor is manufactured by the Lancashire Dynamo & Motor Co., Manchester, whose Canadian officers are at 152-4 Bay St., Toronto.

A large corporation finds it very much to its advantage to have constantly in its employ a lubricating engineer who has direct charge and supervision of the machinery oiling in the various plants. He selects the oils and directs the handling of all lubricants. He saves twice his salary each year. A small manager who can't afford a special man sends his oils and glue to a consulting man for analysis.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

Convention of the Allied Foundry Associations

Programme for the Meeting in Detroit, June 6 to 10—Some Excellent Papers Have Been Arranged for—Canadian Foundrymen Should Attend.

The Detroit local committee will tender a complimentary dinner to the officers of the allied associations and to the Technical Press, on Monday evening, June 6, at the Pontchartrain Hotel.

The Ladies' Committee will give a trip around the city, and a theatre party, on Tuesday, June 7.

A smoker will be given at the Light Guard Armory, on Tuesday evening, June 7. Chairman Woodison has some original features to "pull off," and those who recall his previous efforts along this line will realize that a treat is in store for them. The ladies will be over at their theatre party that night, and as the theatre is located near the hotels, no one need leave early to call for their wives.

Officers are Busy.

Arthur T. Waterfall, president of the American Foundrymen's Association, will make an extended trip through the east, the middle of March. During this trip, he will meet the Philadelphia, New York and Pittsburgh foundrymen, and will hold a conference with Dr. Richard Moldenke, secretary of the organization, and perfect the plans for making this the greatest convention of the organization.

W. M. Corse, secretary of the American Brass Founders' Association, was in Detroit on March 4 and 5. He reports that the membership of his organization has increased over 50 per cent. during the past year. Mr. Corse is now with the Lumen Bearing Co., of Buffalo, and the new address should be noted when writing him.

Richard Moldenke, secretary of the American Foundrymen's Association, returned from Europe on March 1, and from this time on his whole energies will be devoted to furthering the coming convention.

Joseph J. Wilson, has recently accepted the position of generl superintendent of the foundry departments of the General Motors Co. Mr. Wilson is chairman of the Plant Visitation Committee of the convention, and is already planning to give the delegates every opportunity to visit the new and very up-to-date foundries, which have done so much to make Detroit a centre of the foundry industry, especially relative to the automobile industry. He is conceded to be the greatest authority to-day on the production of auto engine cylinders in this country, and the work of his committee will doubtless prove to be one of the best educational features of the convention. It is not too early for those desiring to visit certain particular plants, to get into communication with Mr. Wilson, that he may make suitable preparations.

Boat Ride on Detroit River.

The boat ride on Detroit River and Lake St. Clair will surely be one of the most enjoyable features of the social part of the convention. The probability will be that we will use the Ste. Claire, the new steamer of the Detroit, Belle Isle & Windsor Ferry Co. This steamer will go into commission just before the convention opens, and she is the very latest word in pleasure steamer construction. She will handle fully 4,000 people, and no one will be crowded. The trip will last from late in the afternoon till midnight, and good music, and something good to eat will be provided by the committee. Ladies along, of course. Oliver Phelps, resident manager of the M. A. Hanna Co., has charge of this.

Incidentally, speakng of Detroit as a foundry centre, there are 10 foundries under construction here at the present time. Three of them will be the largest of their kind on the continent.

The local committee has already arranged for Postal and Western Union wires into the exhibit, and for telephones with a central switchboard and ample operators. The Detroit Police Dept. furnishes the needed uniformed men, and the Fire Dept. will station a company on the grounds to give the needed fire protection. Electric apparatus will be provided, to anticipate the needs of those who desire to illustrate technical papers in a proper manner.

The chairman of the convention sessions committee, W. P. Putnam, who is spending a few weeks in Arizona at this time, is perfecting the most perfect arrangements to assist those who desire special features in their papers. Write him at 1111 Union Trust Building for anything wanted in this line.

James S. Keightley, supt. of the Great Lakes Engineering Works, is chairman of the reception committee. He is so well known for his genial smile and glad hand, that the right kind of welcome is assured for delegates.

Hotel Headquarters.

The local committee has established headquarters at the Pontchartrain Hotel. President Waterfall and Chairman Stephenson will be found at Parlor H, when they are not at the convention meetings.

The F. & M. S. Association will have its headquarters at the Cadillac Hotel. The American Foundrymen, the Brass Founders and the local committee will have headquarters at the Hotel Pontchartrain. The Foundry Foremen will use the Griswold House as headquarters. All these hotels are located near together, and ample room will thus be made for all. The Hotel Tuller, the Metropole, the Wayne, the Ste. Claire, and the Normandie all within a few blocks of each other, will doubtless receive their quota of visitors.

The date of the convention is purposely arranged with the Detroit Convention and Tourist Bureau so as to occur at the time when no other convention is in Detroit, thus offering the best possible accommodations to our delegates. Remembering the experiences of former conventions, it is well to reserve rooms at once, and be assured of a good place. The phenomenal growth in the associations reported by the secretaries, point to the largest convention in the history of the organization.

N. K. B. Patch, Toronto, is chairman of the committee on papers for the meeting of the American Brass Founders Association. He reports some very good ones are already promised.

On Thursday evening, February 17, at the association rooms in the Stevens Building, Henry M. Lane, editor of "Castings," Cleveland, O., presented to the Detroit Foundrymen's Association a splendid paper on "Modern Metallurgy and the Electric Furnace."

The development of the electric furnace in recent years has made possible the manufacture of an extensive line of ferro-alloys, refractory materials, abrasives, and other products which are used extensively in foundry practice. The

speaker traced the history and development of the electric furnace, noted the different types used, their relative advantages, the uses of the different products in the foundry, and the field the electric furnace is destined to occupy in modern metallurgy.

In this connection reference was made to a duplex process in which the electric furnace is used to finish or refine metal melted in some other furnace. The lecture was illustrated with about fifty lantern slides, and the speaker, also, had on exhibition a large collection of electric furnace products, including ferro-alloys, abrasives, refractory material and pure metal, together with the materials from which these products are made.

The above talk was one of the series at the monthly meetings of the Detroit Foundrymen's Association in the interest of advancing the froundry's art. The meetings have been remarkably well attended both by the foundry executives of the many foundries in Detroit, but also the foundrymen within easy distance from Detroit. The enormous advance of the automobile industries here has led to an eager seeking after the very latest and up-to-date methods of production on the part of the foundrymen engaged in the manufacture of brass, aluminum, gray iron, malleable or steel castings. The increasingly high standard of excellence demanded by the purchasers of these products has greatly stimulated the industries to meet this demand, and Detroit is making castings of the various metals, now, that equal or surpass any made in the trade.

Every Foundryman Should Attend.

The week of June 6, Detroit will be honored by the meeting here in convention of the American Foundrymen's Association, American Brass Foundrymen's Association, Foundry & Manufacturers' Supply Association, and the Association of Foundry Foremen. The fact that something like five thousand foundry executives are coming from all sections of the United States and Canada to gather together at Detroit convention is significant enough in itself. Unquestionably the exhibit of mechanical equipment on which so large an outlay is made, accounts for the great outpouring, but the technical session of the convention also claims a large interest for those attending. The commercial consideration makes a very strong appeal, and it is true that any exhibit that can show the proprietor or superintendent how he can save money is a first-class attraction. The excellent work done by the American Foundrymen's Association with the accumulative influence it has exerted has been the exciting cause. The association has marked the lines of advance and mechanical invention has met the need.

Large Exhibits.

Canadian Machinery has a letter from C. E. Hoyt, Lewis Institute, Chicago, Ill., secretary of the Foundry & Manufacturers' Supply Association. Applications for space have been received for an amount in excess of that called for at any previous convention.

Dr. Frank T. F. Stephenson, Detroit Saw & Brazing Works, 12-14 West Atwater St., is the energetic chairman of the general convention committee. Information will be promptly supplied by application to this address.

SUCCESSFUL FOUNDRY COST SYSTEM.*

* Read before Cincinnati Convention A.F.A.

By J. P. Golden, Columbus, Ga.

A practical simple cost system, suitable for foundries doing a business of 125,000 to 150,000 lbs., net, clean, medium, and light grey iron castings per week, with an approximate force of 75 to 100 men.

My object in devising the following system, was to enable me to have a ready means of reference and comparison in the several foundry departments at all times, and incidentally to lower the cost per 100 lbs. for net, clean castings, without extra clerical force or cost, or causing undue work for foundry foreman, assistant, or cleaning room foreman. This system is not perfect and could be improved. To do so in our case, would require more clerical force, which would increase the non-producer cost per 100 lbs. net, clean castings. For instance, in case of a pulley with a cracked arm that was to be remelted; without inquiry, I wished to know why it was to be made over, and by whom returned. The system referred to covers this case, also by whom the pulley was made, the time taken in making, weight of pulley, to whom sold, cause of crack, etc. These records are all accessible to both superintendent and foundry foreman under this system.

In the event of a molder asking for a raise, the system shows either the superintendent or foreman what class of work the man has been working upon, his record, his present pay, whether by hour or piece, and the number of pieces lost, as well as the weight molded, also the means of comparing the wages and output of one man with another.

I also wished to have a method whereby the foundry foreman could see exactly what each department was doing, to allow him to correct any bad practice that he might control, so far as rested with him.

I wished also to know at a glance what the cost per hundred lbs. for clean castings was for last week, or last year, or the average for a year. How many pounds net clean castings were made in any week, or the average for a year, with the per cent. loss for bad castings. As to wage cost alone for 100 lbs. for any week, or yearly aver-

SAMPLE OF ENTRY.

Date Returned	By Whom Returned.	Description	Cause	Whose Fault	Weight.
Apr. 26, '09	Our Mch. Shop	1 S. B. Pulley 36 x 8—$2\frac{7}{16}$ in. bore.	Bored too large	Mch. Shop	240 pounds
Apr. 29, '09	Our Mch. Shop	1 Split Pulley 24 x 6—$2\frac{3}{16}$ in. bore.	Broke lug in splitting	Mch. Shop	120 pounds

May 5, '09	Foundry	1 D. B. Pulley 36 x 8—$2\frac{5}{16}$ in. bore.	Blow hole in face	Foundry.	260 pounds

Fig. 2.—Defective Castings Record.

age. What the cost per hundred lbs. was for either the non-producers, rumbling department, molding department, core shop, day or night cleaning gangs.

I also wished to separate the different kinds of castings into classes, with current prices for these castings, for both our shop and customer, so that having the approximate cash value of castings, and deducting therefrom the cost of pig, scrap and coke, wages, and fixed expense per 100 lbs. clean net castings, I would be able to find the approximate cash profit per week.

After a satisfactory trial of the following system for nearly two years, without extra clerical force or cost, (the weekly report being made up in the unoccupied time of a draftsman), it has occurred to me that there might be other members of the association to whom my system might be of interest; therefore, I have submitted this paper.

Daily Cupola Report.

The system consists of, first: a daily cupola report, Fig. 1, the printed form having column for charge, number pounds coke and brand, pounds pig iron and brand, and per cent. silicon and sulphur, scrap, foreign and returns, and total charge, also lines for weekly totals for use in weekly report. Ratio of coke to iron. Time started blast. Time dropped bottom. Average blast pressure. Per cent. sulphur in heat. Per cent. silicon in heat. Remarks. With each sheet signed by foreman.

Daily Foundry Report.

Second: the Daily Foundry Report, which is made up by the rumbling room foreman. This report consists of a sheet, with columns for name of molder, hour or piece rate, number of molds, number castings, time of helper, pattern description, with columns for weights of the various classes of work, as pulleys, sheaves, hangers, hanger boxes, pillow blocks, couplings, cane mills, factories, miscellaneous, etc. Also column for number of pieces lost, total weight of each kind of piece lost, and a cause column for same, showing if it did not run, if was crushed, blowed, or whatever cause of defect. There is a line at bottom of sheet for weekly totals, to be used in weekly report. The daily foundry report furnishes a ready means of comparison of each molder's record, with his own, or with other molders, as to quantity of good castings, castings lost, weight and cost of same. This report also shows the amount of good and bad castings for each day, in each class, with the weekly total for each.

Defective Castings.

Third: there is a book for defective and other castings returned from shop and customers, Fig. 2, in which is the following rule:

"All castings returned by machine shop customers, before being made over, must be entered in this book, giving cause for making over. Castings returned to foundry from shop or customers, through no fault of foundry, must not be deducted from net foundry castings, and should be considered as foreign scrap. If fault of foundry, they are charged back to foundry and are considered as foundry return scrap."

This book has columns for showing date returned, by whom, description, cause and weight. Without this book, there could be returned defective castings, which was the foundry's fault and made over without the superintendent's knowledge. With the "to be made over" casting book, all castings returned are specified therein. If the fault of the machine shop, it is so stated. If returned from customers, this is noted, with date, description, cause and weight. No casting is made over without being recorded in this book. This book being always open to superintendent and foreman, saves inquiries and explanations. Possibly a few examples here will make the value of this book plainer. For example: the superintendent upon examination of this book, finds a record of a split pulley 36 inches x 12 inches—2¼ inch bore, lug broken off in machine shop in splitting, or a record of a pulley 24 inches x 8 inches

WEEKLY FOUNDRY REPORT.

GOLDENS' FOUNDRY AND MACHINE CO.
COLUMBUS, GA.

GRAND TOTAL WAGE COST PER HUNDRED POUNDS $

Fig. 3.—Weekly Foundry Report.

—2 inch bore, bored too large in machine shop. These cases would not be through any fault of foundry and the weights would not be deducted therefrom. The castings would be considered as foreign scrap. If the record showed a pulley 12 inches x 4 inches—1 7-16 inch. bore, with dirty face, or 12 gears returned by a customer, from no fault, except in excess of the order, or 25 J. I. Castings returning by customer with too large cores. These latter three cases would be the fault of the foundry, and the weights would be deducted from clean net castings for the week in which they were recorded, and considered as return foundry scrap.

Weekly Foundry Report.

Fourth : the Weekly Foundry Report Sheet, Fig. 3. This sheet is made up from the daily foundry report, and cupola sheets and the book (to be made over castings). On this sheet, provision is made for record of bad castings returned from foundry, shop or customer, by classes, as well as the good castings made. The total of good castings minus defective castings gives net good castings for week. The average per cent. of all castings lost is given, with the per cent. loss in each class, with the total pounds pig and foreign scrap charged in cupola, and the net good castings deducted therefrom, we find the per cent. lost in remelt, cupola droppings, gang-ways, etc. This loss is apt to deceive one, for where the foundryman would estimate a loss of 3 to 5 per cent. on a certain class of work, he might overlook the fact that he had not taken into consideration the remelting loss of gates. For instance : if upon exceedingly light work with 25 to 40 per cent. gates, the loss from continued remelting etc. might run as high as 8 p.c. or 10 per cent. The weekly foundry report also has a record of total melt taken from daily cupola sheet, which with net good castings deducted gives per cent. bad castings, gates, etc. of total melt, including foreign scrap, returns and pig. In a division. headed cupola charge, is given the number of pounds pig iron, foreign scrap and coke, with current price of each and total cost per week. To these amounts are added the total wages, giving a total of material and wages for week, which divided by the net good castings, gives the cost per 100 lbs. net castings, including pig iron, scrap, coke, wages.

Non-producers.

The weekly report also has separate divisions for non-producers, rumbling department, molding department, core shop, day and night cleaning gangs, in which the wages of each class of men in each division are given separately, by total, and the wage cost per hundred lbs. For instance : in our own shop, the non-producer division includes the foreman, assistant foreman, pulley man, craneman, the clerk (who is also rumbling room foreman), cupola tender, cupola helpers, and carpenter, the separate wages per week of each being given, the total of all, and the wages cost per 100 lbs. net castings. The weekly report also embodies the grand total wages cost per 100 lbs. and this is the most important item, for both foreman and superintendent, for this item is one which the foreman can control to the greatest extent, and which speaks the loudest in favor of the system.

It may be of interest to the members of the association to know that since the adoption of this system, nearly two years ago, each period of six months' average records, have shown a decided decrease in the wages cost per 100 lbs., amounting to nearly 20 per cent. since adopting the system.

In connecting with the weekly report is a detailed report of the pounds of good castings, to whom sold or charged, and price for each lot, and from this sheet is prepared on the back of the weekly report, a statement giving the estimated profit or loss for week.

And lastly, there is a ready reference sheet (headed Comparison of Per Cents. Wages Cost per 100 lbs. in different departments of foundry from weekly foundry report) giving the comparison by weeks and the average comparison at the end of each year of the following items after date. Net good castings for week, castings killed in machine shop, with columns for the per cent. loss of each of the several classes of castings, each class in a separate column, gives a ready means of comparison in that class for all of its weeks.

There are also columns for the cost per week per 100 lbs. net castings, including pig iron, scrap, coke, and wages, the wage cost per 100 lbs. in the non-producers, rumbling and molding departments, also the core shop, day and night cleaning gangs, with a column for grand total wage cost per 100 lbs.

Both the superintendent and foreman have access to the several reports, giving each the means of knowing the actual conditions in all departments on the foundry at all times.

This system gives the foreman the means of remedying a small or defective output by the knowledge of the cause producing it, and to place each molder upon the class of work to which he is best fitted to increase the general output.

It is an encouragement for a good foreman to know that every gain in his record is brought to the attention of the superintendent, and should he be a little careless at times, he knows that the report will show it, and he is more apt to avoid a bad report. Moreover, it sets a pace for him to keep up to so if the production is a little light the first part of the week he can often turn out a little more the last part to keep up the production.

Also in the case of a change in foreman, not only does the superintendent have his judgment to base the worth of the new man upon, but the records themselves show the standing of the new man in comparison with the old, in the average wage cost per hundred lbs. net clean castings under similar conditions.

The system also furnishes a basis for closer estimates than formerly, upon work a little out of the usual run, by knowing exactly what prices can be accepted for the regular work. The foundry foreman in this case is allowed nominal control of the foundry, hiring and discharging his men, fixing their wages, and increases in pay for his men are by his recommendations, subject to approval of superintendent.

As the system consists simply of a set of forms which can be cheaply procured from any printer, which forms are filled in each week, those of the members who are interested, may get a clearer idea of this system by referring to the sample forms which I have at your disposal.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

The G.T.R. will build new engine shops at Brockville.

The Montreal Steel Works will erect a foundry at Montreal.

The C.P.R. will erect a new machine shop at Calgary to cost $20,000.

The Regina Machine and Iron Works Co. will erect a foundry to cost $5,000.

The Don Iron Works, Toronto, including all machinery, has been completely destroyed by fire.

The Down Draft Furnace Co., Galt, is running on double shifts, owing to the large number of orders received.

The machine shop of the Schofield-Holden Machine Co., Toronto, was damaged by fire to the extent of $7,000.

Work on the Port Arthur Steel & Wagon Works plant will soon be started. It will have a big foundry attached.

The Bergmann Electrical Works, of Berlin, Germany, are considering the location of a branch industry at Montreal.

The Parker Foundry Co., Montreal, have been authorized by the Dominion Government to increase their capital from $25,000 to $100,000.

Fire did about $5,000 damage in the furnace room of the premises of William Coulter & Son's brass works, 155 George Street, Toronto, recently.

The annual meeting of the Montreal Steel Works was held at Montreal, about the middle of March. The net earnings for the year 1909 show that the company had a most successful year.

A disastrous fire broke out on March 18th in the premises of Valentine & Martin, Waterloo, shoe manufacturers. The interior was gutted. The loss will be about $30,000, which is partially covered by insurance.

The St. Thomas city council has closed a deal to loan C. Norsworthy & Co., foundrymen, $10,000 for fifteen years, without interest, to enable the company to take over the manufacture of the Howard furnaces, now made in Berlin. They agree to employ fifty hands at the outset.

The McBrien Mfg. Co.'s nail and tack factory at Toronto, was damaged by fire on March 7, to the extent of $1,000, and the machinery, etc., to the extent of $5,500. The loss is only partially covered by insurance. It will be some time before the plant can be operated again.

Shurly & Dietrich, Galt, the largest saw manufacturers in Canada, have dissolved partnership, C. J. Shurly retiring. The business will be carried on by J. C. Dietrich forming a joint stock company, with increased capital. Included in the transfer are the iron and brass bedstead works and the R. H. Smith Saw Works, St. Catharines.

Brent, Noxon & Co., Toronto are placing the bonds of the Standard Drain Pipe Co., of St. John, P. Q., on the market. Among the lines manufactured are chimney tops, fire bricks, locomotive arch bricks, chimney fire proof linings, and all kinds of vitrified clay and fire clay products. The output of the two factories at St. John, P. Q., and New Glasgow, N.S., amounts to 2,000 carloads per annum.

Tenders addressed to the Commissioners of the Transcontinental Railway, Ottawa, will be received until April 12 for the following: Machines and tools; leather belting; shafting, hangers, steel frame work, etc.; miscellaneous equipment, industrial track and lockers; motors; furnaces and forges; cranes; air compressors; grey iron foundry equipment and brass foundry equipment.

In a recent issue we referred to the Canadian Crocker Wheeler Co., Montreal, locating in St. Catharines. They have purchased a site of 8 acres, on which are practically new buildings having a floor space of about 30,000 sq. ft. The company is installing in these buildings tools and equipment for the manufacture of electrical apparatus. It is understood that all the necessary equipment has not yet been purchased.

A disastrous fire occurred near Campbellcroft, in Hope township, on March 16th, when a large frame barn, owned, it is said, by the Toronto Loan & Savings Co., was destroyed. Mr. Stewart Dean, who is going west, had just vacated the farm, and Mr. Thomas Worr was moving in and had placed a couple of loads of hay and other feed in the barn. He first noticed flames bursting from the upper part of the barn, and after considerable trouble managed to get his horses out.

At the annual meeting of the shareholders of T. McAvity & Sons, foundrymen, St. John, T. McAvity, president of the board of directors retired from that post and G. McAvity was elected in his stead. J. A. McAvity was made vice-president and J. W. McAvity succeeds his father, the late J. H. McAvity, as a member of the board. C. Caster was elected secretary. One of the matters discussed at the meeting was the future of the company's iron foundry, which it has been stated might be removed to the west. An offer from Port Arthur has been under consideration for some time, and another came more recently from Montreal, while Toronto has also been considered. No decision has yet been reached in the matter, and the directors will make a report at a later date.

Electrical Notes.

Summerside, P.E.I., will instal a new street lighting system.

The work of installing the new pump at Fenelon Falls has been completed.

The Sackville, N.B., Electric Light Company inaugurated its system of electric power early in March.

The Toronto Electric Light Co. has installed a large steam turbine as an addition to its present steam reserve.

The Canadian-British Insulated, of Montreal, have been awarded the contract for the cable for the electric power plant at Toronto.

The Railway Committee has passed the Montreal Central Terminal bill with the elimination of clauses authorizing the acquisition of lighting and power companies.

The necessity of enlarging the electrical plant at Victoria to permit of increased service in street lighting is being considered by the electric light committee of the council.

A year from now the Electrical Development Co., Toronto, will increase the capacity of their plant from 50,000 to 85,000 horse-power. Orders for three machines were given some time ago.

The Canadian Westinghouse company's tender for equipment for the power terminal station at Winnipeg, was recommended by the board of control for acceptance. The price of the tender is $116,500.

The following contracts for transformers were awarded by the Toronto city council: Canadian General Electric Co., $8,800; Canadian Westinghouse Co., $5,430; Allis-Chalmers-Bullock, $12,670.

The Dufferin Light & Power Co. has purchased the Shelburne and Orangeville lighting plants and a water power at Horning's Mills capable of developing 1,000 h.p., which it intends developing the coming summer.

The following were the tenders received for the full equipment for the installation of Niagara power at St. Thomas: Canadian General Electric Co., $19,050; Lancashire Dynamo & Motor Co., $18,447, and the Canadian Westinghouse Co., $18,170.

The Campbell Lumber Co., Weymouth Bridge, N.S., are contemplating the installation of an electric plant at the Upper Site, known as Sissiboo Falls, to generate electricity for their lower pulp mill, as well as lighting the neighboring towns.

The following are included in the supplementary estimates of the Ontario Provincial Treasurer: Electric plant, Hamilton Asylum, $12,000; electric plant, London Asylum, $25,000; electric plant, Ontario Agricultural College, Guelph, $15,000.

The Erindale Power Co., Erindale, Ont., sustained a loss of $1,200 by an unexpected flow of ice which rushed down upon their new dam on the Credit River at Erindale. The ice made a gap in the centre of the dam about 75 feet in length. The damage was repaired.

C. H. Mitchell, of Mitchell & Mitchell, consulting engineers, Toronto, has reported favorably on La Colle Falls, neat Prince Albert, Sask., as a site for power development. The proposed plans call for a canal a mile long and a dam across the river 750 feet in length.

A. W. E. Fawkes is inspecting two power sites in the vicinity of Montreal, one where 40,000 horsepower can be developed at a cost of $200,000 and another where from 10,000 to 12,000 horsepower can be developed at a probable cost of $150,000, for additional sources of power for Montreal's lighting system.

The year 1910 promises to be one of rapid extensions for the Ontario Power Co., of Niagara Falls. General Greene, vice-president of the company, outlined the programme about the 1st of March, which includes the immediate installation of a second 18-foot conduit tube, and the excavation of rock for the third and final tube.

Some of the recent contracts closed by the Canadian General Electric Co., Toronto, are with the Electrical Development Co., of Ontario, who are duplicating their output at Niagara Falls, this order calling for three enormous generators of 15,000 horsepower each, which establishes a world's record for size of individual units. The Ontario Power Companies' order called for three generators of 12,500 horsepower each.

Municipal Enterprises.

Aldermere, B.C., will construct a waterworks plant.

The council of Medicine Hat, Alta., will spend over $60,000 in extending the sewerage system.

F. W. Murdock, city engineer, of St. John, has been instructed to prepare plans and estim-

ates of cost for the renewal of pipes in the water distribution system. He will also prepare a report on the matter of additional hydrants.

Ladner, B.C., south of Vancouver, is securing plans for a new water system, to cost $125,000.

Winnipeg will call for tenders for 2,500 feet of water pipe, also for 150 valves and 50 hydrants.

City Engineer Childs, of Calgary, is preparing plans for a trunk sewer and septic tanks to cost $800,000.

The New Glasgow, N.S., city council is again considering plans for increased water supply at an estimated cost of $175,000.

The following by-laws will be voted on at Regina, Sask.; sewerage and waterworks extensions, $10,000; exhibition buildings, $25,000; market house, $16,000.

The municipality of High River, Alta., will apply to the Provincial Government for power to borrow $125,000, required for the construction of waterworks and sewerage systems.

Tenders addressed to the chairman of the Winnipeg Board of Control will be received until April 4, for supply of cast iron water pipe, valves and hydrants for extension of the waterworks system.

City Engineer Ker, of Ottawa, has prepared the following estimates: sewer main, $5,000; waterworks, old aqueduct, (renewing piers), $4,000; renewing old services, etc., $10,000; laying new services, $15,000; renewing and repairs to hydrants, $3,500.

Tenders were accepted by the Water Committee at Vancouver, for brass and water pipe fittings and upwards of 65,000 feet of galvanized water pipe. The successful bidder in the former was Crane & Co., at $3,356.50, while A. J. Forsyth secured the latter at $2,622.50.

The Toronto Board of Control awarded the contract for the construction of the outfall sewer, in connection with the sewage disposal works to F. H. Dickenson, Hamilton, for $125,504. The Canada Foundry will supply the special castings needed in connection with the plant.

The contracts for the equipment of the pumphouse at London were awarded to the following: turbine pumps, J. McDougall & Co., Montreal, $5,640; motors, dynamos, etc., Lancashire Dynamo and Motor Co., Manchester, England, $11,032; compressors and gas engines, G. H. & H. J. Daniels, Stroud, England.

Sealed tenders will be received until noon on Wednesday, April 6th, 1910, for the building of concrete abutments and floor for a steel bridge to be erected over the Sydenham River between the Townships of Moore and Sombra. Plans and specifications can be seen at the office of the undersigned, and also at the office of Bell & McCubbin, Civil Engineers, St. Thomas. T. H. Holmes, Colinville, Ont., Neil McGugan, Wilkesport, Ont.

Sealed tenders will be received by the Weston Village clerk until 8 p.m. on Monday, April 18, 1910, for the following works:—Contract "B"—Pump house; contract "F"—Mechanical water filters; contract "G"—Electrically operated pumping machinery. Plans and specifications may be seen at the office of the Chief Engineer, Mail Building, Toronto, or at the town hall, Weston. J. H. Taylor, Esq., clerk, Weston, Ont. Willis Chipman, Chief Engineer, 204 Mail Building, Toronto, Ont.

Sealed tenders will be received by the Secretary-Treasurer of the town of North Battleford until 8 p.m. on Tuesday, April 19th, 1910, for the following works:—Contract "A"—Pipelaying, waterworks, and sewers; contract "D"—Cast iron water pipes; contract "E"—Fire hydrants, vales, etc.; contract "L"—Concrete reservoir; contract "X"—Sewage disposal works. Plans and specifications may be seen at the office of the Chief Engineer, Winnipeg and Toronto and at the town hall, North Battleford. S. Cookson, Secretary-Treasurer, North Battleford, Sask., Willis Chipman, C.E., Chief Engineer, Winnipeg and Toronto.

Sealed tenders will be received by the secretary-treasurer of the town of Weyburn, until 8 p.m. on Wednesday, April 27th, 1910, for the following works:—Contract "A"—Pipelaying on the sewerage system; contract "B1"—Water works pump house; contract "B2"—Power house; contract "F"—Mechanical water filters; contract "G"—Water works pumping machinery; contract "S"—Sewer pipes; contract "W"—Furnishing wooden stave pipes; contract "X"—Sewage disposal works. Plans and specifications may be seen at the office of the Chief Engineer, Toronto and Winnipeg, and at the town hall, Weyburn. Geo. Ross, Esq., secretary-treasurer, Weyburn, Sask. Willis Chipman, C.E., Chief Engineer, Winnipeg and Toronto.

Sealed tenders will be received up to 12 o'clock noon, on Wednesday, April 6th, for the following:—(A) All works required in connection with construction of abutments to bridge at M. P. 48.91. Tenders to be marked on the envelope, "Tender for Abutments." (B) All the works required in connection with construction of substructure of steel trestle for Wabis River, M.P. 119.13. Tenders to be marked on envelope, "Tender for Substructure of Steel Trestle Spans." Plans and specifications may be seen, and forms of tender procured, at the office of the Secretary-Treasurer, 25 Toronto Street, Toronto, and at the office of the Chief Engineer, North Bay. A. J. McGee, Secretary-Treasurer, of Temiskaming & Northern Ontario Ry., 25 Toronto Street, Toronto.

Structural Steel.

The Collingwood, Ont., council is considering a $10,000 bridge by-law.

County Engineer Bell is preparing plans for the construction of a steel and concrete bridge at St. Thomas.

Work on the construction of the C.P.R. bridge at Fort William is to start as soon as the necessary order is secured from the Dominion Railway Board.

The contract for the construction of a steel viaduct over the North Wabie river has been awarded to the Hamilton Bridge Co. by the Commission of the T. & N. O. Railway.

The Bank of Montreal have awarded to the Dominion Bridge Co., Montreal and Winnipeg, the contract for steel and iron work on their new building at Winnipeg. Between 600 and 700 tons will be used.

The contracts for reinforcing steel and iron stairways, etc., for the transformer station for the Calgary Power & Transmission Co., at Exshaw, Alta., have been awarded to the Manitoba Bridge & Iron Works, Winnipeg.

The residents of Annacis Island, near New Westminster, are anxious to secure a $40,000 bridge to connect their island with Lulu Island.

The contract for the new superstructure for Louise bridge, Winnipeg, has been awarded to the Algoma Steel Bridge Co., Winnipeg, at $134,450.

The Canada Foundry Co., Toronto, is sending a large amount of steel to British Columbia for construction purposes. Eleven carloads are now on the way, considerable of this to go into the construction of the new eight-storey building to be erected by the Canada Life Assurance Co., at Vancouver. In addition, six carloads of steel are also to be sent here by the same company to be used in the new transmission towers to be erected by the B.C. Electric Railway Co., at New Westminster.

The Manitoba Bridge and Iron Works, Winnipeg, have erected fire escapes on the Royal Hotel, Fernie; Public School at Stony Mountain, Man., and the St. Boniface Convent, St. Boniface, Man. They also have contracts for the structural steel for the new Bank of Montreal, Winnipeg; R. H. Williams' Departmental Store, Regina; Winnipeg Veterinary Hospital, and the new Union Station, Fort William, also for the iron and steel for four combination span bridges at Shellmouth and Russell, Man., and the new bridge over the railway tracks at Saskatoon.

Planing Mill News.

P. A. Paulson is erecting a $100,000 sawmill at Kitchener, B.C.

Construction has begun on the Joyce sawmill, six miles from Quesnel, B.C.

McMaster Bros., of Kemptville, Ont., are erecting a $20,000 saw mill near Aylmer, Que.

The sawmill of J. H. Gignac & Co., at Quebec, was damaged recently to the extent of about $70,000.

The planing mill of Madden Bros. & Brown, at Toronto, was damaged by fire to the extent of $8,000 on March 14.

The planing mill and residence of Treffle Bergeron, at Murray Bay, Que., were destroyed by fire recently. Total estimated loss, $70,000. Mill and residence will be built at once.

The Guelph Patent Cask Co., Woking, England, bought out the timber limits and other property of the Great Northern Lumber Co., Scotstown, P. Q. The deal involves several thousand acres of lumber limits, besides several large mills. The company will start operations soon.

The new woodworking factory at St. John, which is to take the place of the one owned by A. E. Hamilton and destroyed by fire a few weeks ago is almost completed and Mr. Hamilton is again working on the contracts which were held up on account of the fire. The re-organized company has a capital of $50,000.

General Manufacturing News.

The Oblate Fathers will build a printing office at Winnipeg.

A number of St. John men are seriously considering a project for establishing an automobile factory at that place. Geo. Fleming, one of the proprietors of the Phoenix Foundry, is said to be one of the most active promoters of the scheme.

The contract for the construction of the Western Dry-dock and Shipbuilding Co.'s plant, Port Arthur, Ont., has been awarded to the Canadian Stewart Co., of that city. The cost of the whole will be upwards of $1,000,000. The company has the assurance of two big steel freighters to build when the plant is completed.

Building Operations.

A new high school will be erected at Victoria.

A general hospital will be erected at Princeton, B.C.

Methodists of Regina will establish a college to cost $250,000.

A new general hospital will be erected at Smith's Falls.

The Winnipeg school board will erect a school to cost $80,000.

The Holland Varnish Co. will erect a new factory at Montreal.

An isolation hospital will be erected near Grand Forks, B.C.

George Weston will erect a four-storey biscuit bakery at Toronto.

The Dominion Government will erect a drill hall at Fernie, B.C.

J. H. Todd is to spend about $40,000 on a building at Victoria.

The Great West Saddlery Co. will erect a factory at St. John, N.B.

The reconstruction of Manitoba's legislative buildings will cost $400,000.

The Dowsley Spring & Axle Co., Chatham, will extend their plant this year.

Catholics of North Sydney, N.S., will erect a church to cost $18,397.

A new and up-to-date opera house will be erected at Brockville, Ont.

The Presbyterians of Vancouver will erect a new church on Pender Avenue.

Walker, Parker Co. will erect four-storey brick addition to factory at Toronto.

An office building will be erected on the Banet Block, Vancouver, to cost $225,000.

The Ottawa Vacuum Cleaner Co., contemplate locating at Brockville, Ont.

The Union Mutual Insurance Co. will erect an office building at Portage la Prairie.

A new armory and post office will be erected at Strathcona, Alta., to cost $200,000.

Bonar Presbyterian congregation will erect a new church at Toronto to cost $85,000.

An undenominational residential college will be erected at Moose Jaw, to cost $250,000.

Toronto Showcase Co. will erect a two-storey brick factory at Toronto to cost $32,000.

Lever Bros., Toronto, will build an addition to their factory at that place, to cost $17,000.

The contract for a new school at Stratford has been awarded to Wilson & Wilson for $68,-000.

C. P. Walker, of Winnipeg, will erect modern theatres at Winnipeg, Fort William and Saskatoon.

A mammoth department store is to be erected by the Marshall Field Co., of Chicago, at Winnipeg.

D. R. Smith, of Boston, is considering the erection of a hotel at Kingston to cost not less than $250,000.

The Parisian Laundry will build a three-storey brick addition to their laundry at Toronto, to cost $11,000.

Wilson & Wilson, of Regina, were awarded the contract for the new public school at that place to cost $68,750.

Tenders are being called for the new $100,000 twelve-roomed school to be erected by the Edmonton Public School Board.

A. C. Hope has prepared plans for R. M. Edgar for a new six-storey apartment house at Vancouver. Estimated cost $175,000.

The Victoria Department of Public Works has awarded the contract for an eight-room school house to A. J. Prudhomme at $26,000.

The Dominion Office and Store Fitting Co. will erect an addition to its factory at the corner of Dundas and Patrick Streets, London.

G. H. Archibald & Co. have been awarded the contract for the construction of the plant of the Western Canada Flour Mills Co., at St. Boniface, Man.

The Geo. White & Son Co. will spend $50,-000 on their plant at London. Permits have been issued for two buildings to cost $19,000 and $10,000.

Mason & McLeod will erect an apartment house at Vancouver to cost $80,000. Another apartment house will be erected by G. King at that place to cost $25,000.

The City of Winnipeg is making an application to legislature for an amendment to the charter, so that $500,000 may be raised for hospital and morgue purposes.

Among the recommendations made by the University Commission at Winnipeg is one for the establishment of an engineering college and a college of domestic science.

The ratepayers of Saskatoon will vote on the following by-laws: $100,000, hospital; $9,000, collegiate institute; $21,000 for completing civic hospital and buildings for fair purposes.

Chatham is to have two automobile factories. The Swift Motor Car Co. and the Aubert Co., both of Detroit, have concluded arrangements for the location of their factories at that place.

Work has commenced on what will be the largest building in Victoria. This is the eight-storey block to be erected by J. A. Sayward, on Douglas Street. The building will cost $200,000.

The new naval college in connection with the Government's naval scheme will be built at Halifax, and will cost $150,000. A barracks for the staff and possibly an admiralty dockyard may also be erected at that place.

The following building estimates have been prepared by the Toronto Board of Education: Technical School, $100,000; Oakwood High School, $90,000; Frankland School, $60,000; additional to Humberside Avenue High School, $40,000; additions to Public Schools, $300,000; Manning Avenue School, $90,000. Total, $740,000.

Railway News.

The New Brunswick Legislature outlined a plan to run an electric line from St. John, N.B., to Quebec City across the State of Maine.

The Great Northern line from Orville, Wash., to Penticton, B.C., has been located. Forty miles of road may be built this year.

Early this summer the Grand Trunk Pacific Railway will take over the 1,200 miles of completed road between Winnipeg and Edmonton.

The contract for the construction of the G. T.P. wharf at Vancouver has been awarded to C. J. Johnson & Co., Vancouver and Seattle.

The Niagara Falls, Welland & Dunnville Electric Railway has been incorporated to build a railway from Niagara Falls to Welland and Dunnville.

A survey party of the C.P.R. has passed through Watrous on a newly-proposed road between Regina and Prince Albert. Watrous is named as a C.P.R. Divisional point.

J. N. Stewart & Son are reported to have secured contracts from the Vancouver, Victoria & Eastern Railway Co. for construction of two sections of its line aggregating 18 and 51 miles of track.

Application will be made to the New Brunswick Legislature for the incorporation of the Gibson & Minto Railway Co., with a capital of $98,000 and authority to connect the New Brunswick railway with the I.C.R. near Gibson.

New freight car shops, six stall addition to Ignace engine house and several standard section houses and station buildings on the Central Division, C.P.R. will be erected this year. Frank Lee, Winnipeg, Divisional Engineer.

Bids are asked by J. S. Dennis, assistant to the second vice-president, C.P.R., Calgary, Alberta, until noon, May 1, for all excavation required to complete the canal system in the eastern section of the C.P.R. Co.'s irrigation block, Alberta, amounting to upward of 25,000,000 cu. yds. of material. Plans, specifications and all other information may be seen at the office of the assistant chief engineer, Calgary, Alberta.

Railway construction tenders will be received up to 12 o'clock noon, April 15, 1910, for the clearing, grading and bridge work on the 31-mile (more or less) section of the Algoma Central & Hudson Bay Railway, between Hawk Lake Junction, Algoma Central & Hudson Bay Railway, and Hobon, Canadian Pacific Railway. For plans, specifications and details apply to C. N. Coburn, Chief Engineer, Algoma Central & Hudson Bay Railway, Sault Ste. Marie, Ont., to whom all tenders should be addressed.

New Companies.

Toronto Structural Steel Co., Toronto; capital, $250,000; to buy, sell and manufacture steel and iron. Incorporators, G. Grant, A. Dods and M. MacDonald, Toronto.

Bebmina Consolidated Asbestos Co., Montreal; capital, $2,600,000; to mine, manufacture and deal in asbestos. Incorporators, W. L. Bond, J. J. Meagher, J. E. Coulin, Montreal.

B. J. Coghlin Co., Montreal; capital $200,000; to manufacture and deal in iron, steel and railway supplies, etc. Incorporators, B. W. Coghlin, G. R. Coghlin and N. J. Dowes, Montreal.

The Glidden Varnish Co., Toronto; capital $100,000; to manufacture and deal in varnishes, stains and paints, etc. Incorporators, W. S. Edwards, J. F. McCarthy and J. Parker, Toronto.

Dominion Explosives, Ltd., Ottawa; capital, $99,000; to manufacture and deal in explosives, powder, and ammunition of all kinds. Incorporators, J. Tamsden, N. Ross, H. G. Nicoll, Ottawa.

Dominion Safe & Vault Co., Montreal; capital $525,000; to manufacture and deal in safes, vaults and metallic furniture, etc. Incorporators H. J. Fuller, W. McMaster and A. W. Wheatley, all of Montreal.

The Goodyear Tire and Rubber Co., Toronto; capital, $250,000; to manufacture and deal in all kinds of rubber goods, etc. Incorporators, D. B. Simpson, W. F. Stearns and N. Wilson, Bowmanville, Ont.

J. W. Kilgour & Bro., Beauharnois, Que.; capital, $300,000; to manufacture and deal in furniture, housefurnishings, beds, carpets, glass, etc. Incorporators, J. W. Kilgour, J. Wilson, R. W. Kilgour, Beauharnois.

Eastern Canada Steel and Iron Works, Quebec; capital, $200,000; to manufacture and deal in engines, machinery, implements and boilers. Incorporators, C. Donohue, E. Duverger, both of Montreal, L. H. Gaudry, Quebec.

A. A. Fournier, Ottawa; capital, $100,-000; to manufacture, buy, sell and deal in stoves, grates, gas ranges, brass, copper, tin and galvanized iron. Incorporators A. A. Fournier, W. L. Jayner, F. D. Crowe, Ottawa.

H. A. Drury Co., Montreal; capital, $200,000; to manufacture and deal in steel, iron, metals, machinery and contractors' supplies. Incorporators, H. A. Drury, Westmount, Que., C. L. Drury, Toronto, F. A. McDonald, Montreal.

Victor Steel and Wood Products Co., Walkerville, Ont.; capital, $40,000; to manufacture and deal in show-cases, gasolene engines, trucks, cars, and automobiles, etc. Incorporators, J. H. Flinn, N. G. Begle and F. T. Chapman, Detroit.

A company with twenty million dollars capital has been organized at Montreal, under the name of the Montreal Elevated and Underground Railway Co., to build elevated and underground railways in the city and Island of Montreal.

The Wabi Iron Works Co., New Liskeard, Ont.; capital, $40,000; to carry on a general foundry and machine shop business and to manufacture and deal in iron, steel and metal, etc. Incorporators, F. L. Hutchinson, A. W. Summers, S. Greenwood, New Liskeard.

National Glass, Ltd., Montreal; capital, $45,-000; to manufacture, buy and sell all kinds of glass, paints, varnishes, dyes and other similar articles. Incorporators, J. A. Dubois, W. Lefebvre, both of St. Chrysostome, and E. C. Frappier, Montreal.

Dominion Cement Co., Montreal; capital, $5,-000,000; to mine, manufacture and deal in cement, stone, sand, plaster and all minerals, metals, earths, etc. Incorporators, E. C. Eckel, Washington, U.S.A., G. W. MacDougall, F. Macfarlane, C. A. Page, Montreal.

F. Pierpon Shaw, St. John; Truman Beckwith, of Providence, R. I.; Charles Rosenthal, of Boston; Wm. G. Latz, of New Haven, and Theodore T. Hazlewood, New York, have applied to the Provincial Government for incorporation as the Big Six Coal Co., with a capitalization of $2,000,000. The company propose to develop the soft coal areas near Chipman, N.B.

The Modern Railway Device Mfg. Co., Montreal; capital, $1,500,000; to manufacture and deal in machinery or mechanical devices constructed under such patents, railway track material, steam or electric railway cars, metal goods of all kinds, tools, implements, engines and boilers. Incorporators, E. A. Bleakney, Ottawa, W. E. Hamilton, H. R. Emmerson, both of Montreal.

The Crossen Car Co., Cobourg, Ont., capital $1,000,000; to manufacture and deal in locomotives, motor trucks, traction engines, motor cars, and to carry on the business of iron founders, mechanical engineers and manufacturers of all kinds of machinery, brass founders, metal workers, boiler-makers, and machinists. Incorporators, A. Falconer, Westmount, Que., M. A. Phelan and H. Stevens, Montreal.

Trade Notes.

Ekins & Norris, of Richford, Vt., were awarded the contract for the Catholic Church to be built at Bedford, Que.

The Prentiss Vise Co., vise manufacturers, who have been at 44 Barclay St., New York, for the past twenty years, have moved into large and commodious offices in the Hardware Bldg., 106-110 Lafayette St., New York.

Percy Woodward, of London, formerly employed at McClary's, the London Foundry Co., and Wortman & Ward's, has obtained a patent at Washington on a rotary engine which he has been working at for five years.

Northern Engineering Works, Crane Builders, Detroit, have been placing orders for new tools and machinery consisting largely of lathes, gear cutters and milling machines, etc., for several months past and the machinery is now being installed.

The Wm. Hamilton Co., Peterboro, have been awarded a large contract by the Simcoe Railway and Power Co., which includes the supplying of penstocks, standpipes and the installing of waterwheels and other portions of the plants, that the company is constructing on the Severn river.

On April 1st, the Tallman Brass & Metal Co., Hamilton, will start to manufacture brass finished goods. They are installing the latest machinery for this line. Since moving to their new plant last November they have doubled their output in brass castings, arctic metal and solder.

James L. McAvity, proprietor of McLean, Holt & Co., St. John, manufacturers of stoves and castings and retail stove merchants, has been appointed colonel of the 62nd Regiment, succeeding Col. M. B. Edwards, who has been retired to the reserve staff. Col. McAvity plans to put the regiment on a voluntary basis and make it one of the crack militia forces of the Dominion.

Smart-Turner Machine Co., 191 Barton St., Hamilton, have recently supplied pumps of various designs to the following: David Morton & Sons, Hamilton; Lopp Bros., Locust Hill; Port Colborne, for waterworks pumping station; Hudson Bay Co., Edmonton; Normal School, Toronto; W. J. Finlay & Co., Strathcona; Petrolia Wagon Co., Petrolia; Canadian Hart Wheel, Ltd., Hamilton; Sam. Lacaille, Nominingue, P. Q.; Midland Navigation Co., Midland; Slingsby Co., Brantford; Thompson & Norris, Niagara Falls; Keenan Woodenware Mfg. Co., Owen Sound; Fowler's Canadian Co., Hamilton, and Miller Bros. Co., Glen Miller. They have supplied tumbling barrels to Laidlaw Bale Tie Co., Hamilton, and to Canada Screw Co., Hamilton. They have also supplied the Kingston Shipbuilding Co., with an independent jet condenser.

"First Engineers" Calendar.

Allis-Chalmers-Bullock, Montreal, manufacturers of hydro-electric plants, etc., have issued a 1910 edition of their "First Engineers" calendar which received so much favorable comment a year ago. This calendar shows two beavers at work, the picture being appropriately named "The First Engineers."

* * *

Sumner Iron Works.

Work is to be started on the immense plant of the Sumner Iron Works in Burnaby municipality, about ten miles southeast of Vancouver, where a site comprising twenty acres has been secured. The present name of the station on the company's property is Ardley, but it is the intention of the company to rename it Sumnerton, in honor of the founder of the Sumner Iron Works, at Everett, Wash.

* * *

Tenders for Electric Light Plant.

Sealed tenders in duplicate, for boilers, engines, condensers, pumps and piping, together with electrical apparatus, for Prince Rupert, B.C., will be received by Thos. Dunn, chairman of electric light committee, Prince Rupert, B.C., up to the noon of the 3rd ol May, 1910.

Plans and specifications and full particulars of delivery, etc., can be obtained from the chairman of the electric light committee at Prince Rupert, or from James Milne, consulting engineer, Loo Building, Vancouver, B.C.

* * *

Ship Building Plant for Winnipeg.

The Doty Engine Works Co., of Goderich, Ont., has organized a branch at Winnipeg and has applied for a Manitoba charter. The site for a shipbuilding yard has been obtained at the foot of Water Street, and offices have been established in the Bank of Hamilton building. In connection with the shipyard, the company will operate a machine shop and boiler shop for the construction of the machinery required for building the steam craft. Several contracts have been received for building steel steamers of the twin-screw type. It is expected that the plant will be operating before next fall.

* * *

Nova Scotia Steel & Coal Co.

The 9th annual statement of the Nova Scotia Steel & Coal Co., has been issued by Robert E. Harris, President. The profits for 1909 amounted to $907,949, as compared with $734,701.53 in 1908. The volume of business transacted by the company during the year shows a substantial increase being in excess of any previous year. During 1909 extensions were made to the mills at New Glasgow and further additions improvements and additions will be made during 1910 to increase the output of finished steel.

MACHINISTS, ATTENTION!

MACHINIST'S TOOL-CASE FREE to one man in every shop. Address, with stamp, O. BURCH, Grand Rapids, Mich. (3)

Notice to Contractors

Tenders for Machinery, Belting, Shafting, Cranes, Air Compressors, etc.

SEALED TENDERS, addressed to the undersigned, and marked on the envelope 'Tender for Machines and Tools,' 'Tender for Leather Belting,' etc., etc., as the case may be, will be received at the office of the Commissioners of the Transcontinental Railway, at Ottawa, Ontario, until 12 o'clock noon of the 12th day of April, 1910, for:

(1) Machines and tools;
(2) Leather belting;
(3) Shafting, hangers, steel frame work, etc.
(4) Miscellaneous equipment, industrial track and lockers;
(5) Motors;
(6) Furnaces and forges;
(7) Cranes;
(8) Air compressors;
(9) Grey iron foundry equipment and brass foundry equipment;

required for the equipment of the locomotive and other shops of the Commissioners of the Transcontinental Railway at Springfield, east of Winnipeg, Manitoba.

Tenders will be received and considered for any or all of the items indicated above and numbered from 1 to 9, both inclusive.

Plans and specifications may be seen in the office of the Chief Engineer of the Commissioners at Ottawa, Mr. Gordon Grant, and in the office of the District Engineer of the Commissioners at St. Boniface, Man., Mr. S. R. Poulin.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied by the Commissioners, which may be had on application to the Chief Engineer at Ottawa, or to the District Engineer at St. Boniface, Man.

Each tender must be signed and sealed by all the parties to the tender, and witnessed and be accompanied by an accepted cheque on a chartered bank of the Dominion of Canada, payable to the order of the Commissioners of the Transcontinental Railway for a sum equal to ten per cent. (10 per cent.) of the amount of the tender.

Any person whose tender is accepted shall within ten days after the acceptance thereof sign the contract, specifications and other documents required to be signed, and in any case of refusal or failure on the part of the party whose tender is accepted to complete and execute the contract with the Commissioners, the said cheque shall be forfeited to the Commissioners as liquidated damages for such refusal or failure, and all contract rights acquired by the acceptance of the tender shall be forfeited.

The cheques deposited by parties whose tenders are accepted will be deposited to the credit of the Receiver General of Canada as security for the due and faithful performance of the contract according to its terms.

The cheques deposited by parties whose tenders are rejected will be returned within ten days after the signing of the contract.

The right is reserved to reject any or all tenders.

By order,

P. E. RYAN,

Secretary, The Commissioners of the Transcontinental Railway.

Ottawa, 2nd March, 1910.

Newspapers inserting this advertisement without authority from the Commissioners will not be paid for it.

BUSINESS OPPORTUNITY.

A PARTY holding a large interest in a well-established prosperous machinery manufacturing company on the Pacific coast, wishes to dispose of part of his holdings to meet personal obligations. Can arrange if necessary for purchaser with proper qualifications to take an active part in the management. This is a splendid opportunity and investment for anyone wishing to get a start in a good, steady, legitimate, profitable business, in a young, growing country. Applicants who mean business, must have at least $20,000, are invited to investigate. Write Box 102, CANADIAN MACHINERY, Toronto. (4)

B. C. Steel Plant.

It is reported that a great steel plant, to cost between half a million and a million dollars is to be established in the near future at a point on the Coast—probably on Vancouver Island—by James A. Moore, president of the Iron Smelting Co., Washington, in conjunction with other prominent capitalists. Extensive coal deposits have been acquired on Graham Island, one of the Queen Charlotte group, in addition to enormous ore bodies on Quatsino Sound and Klin, in the interior, where a rich magnesite mine was lately discovered. The steel plant, which is expected to employ about 2,000 men, forms part of Mr. Moore's extensive scheme.

* * *

Galt Saw Works.

Shurly & Dietrich, proprietors of the Maple Leaf Saw Works, have dissolved, J. C. Dietrich purchasing the interest of C. J. Shurly. The intention of Mr. Dietrich is to form a joint stock company with largely increased capital, to go aggressively into foreign trade, and to take care of the ever-widening field in Canada. Included in the transfer is the Iron and Brass Bedstead Works, having been managed by his son, Percy G., for ten years. The R. H. Smith Saw Works at St. Catharines forms another link in the chain. The Maple Leaf Harvest Tool Works is another, this factory having been sold to the American Fork Trust in May, 1909.

* * *

Iron Works for B. C.

It is announced from Victoria, B.C., that Mackenzie & Mann, Vancouver and Victoria, backed by J. P. Morgan & Co., have purchased the Vancouver island coal mines owned by the Dunsmuir interests and known by the general name of the Wellington collieries, for the sum of $11,000,000 cash. The mines included in the sale produce some of the best coal mined on the Pacific coast, including high grade bituminous, steam, domestic and coking coals. It is announced that Mackenzie & Mann will spend $5,000,000 on improvements to the property, including the erection of iron works, although no details are yet available.

* * *

May Establish Canadian Plant.

During the past year many United States concerns have established factories in Canada to take care of their business in the Canadian territory, and to have a share in the growth of trade on this side of the line. In this connection, Mr. S. H. Reck, Secretary of the Rockford Drilling Machine Co., of Rockford, Ill., was a recent caller at the Toronto office of "Canadian Machinery." He has been visiting Toronto, Hamilton and other points in Western Ontario with a view to establishing a plant in Canada for the manufacture of drill presses and screw lathes.

* * *

The "Soo" Industries.

Plans for extensions and enlargements involving an expenditure of over ten millions of dollars are being worked out by those in control of the Lake Superior Steel Corporation. The enlargement of the works already partly under way will call for an expenditure of approximately $6,000,000, while extensions of the Algoma Central Railway, which is owned by the Corporation, are being planned, to cost nearly $5,000,000. Two large industries, representing an investment of over a million dollars, have recently located in the Soo. A company for the manufacture of chemicals from the by-products of the mills and representing $1,000,000 capital has purchased the charcoal plant from the Steel Corporation. The Dominion Tar Co., capitalized at $100,000, has purchased seven acres of land from the Lake Superior Power Co., and will erect a plant for the manufacture of coal tar from the by-products of the coke ovens.

Detroit Industrial Exposition.

Detroit is to hold an industrial exhibition under the auspices of the Board of Commerce, June 20 to July 6. The exposition grounds will on the Detroit River, where a huge exposition building will be erected and used in conjunction with the large Wayne Pavilion. Plans have been made to accommodate between 250 and 300 exhibits. Not only the products of Detroit's factories will be shown, but also the processes. Running machinery will demonstrate the most modern methods of transforming raw materials into highly finished articles. In one building the general departments will be machinery, metal products, paints, electricity, building supplies, rubber, leather and paper products, drugs and chemicals, tobacco, food products, novelties and specialties, while in the other building will be automobiles and accessories, wagons and carriages, furniture, textiles, boots and shoes, house furnishings, jewelry and scientific instruments.

* * *

The World's Greatest Steel Plant.

"The Greatest Steel Plant in the World" is the subject of a recent book issued by the Iron Age, 14 Park Place, New York. It is a description of the Gary works of the Indiana Steel Co., subsidiary to the United States Steel Corporation. The book is a reprint of a series of articles which appeared recently in Iron Age.

The plant is of unprecedented size and has commanded the interest and attention of the entire industrial world. The plant was projected under conditions unhampered by limitations of capital or site and the completed plant represents the acme of achievement in this branch of the world's achievements.

Every particular was considered before decisions were arrived at, so that the whole plant is a model of economy. A tract of 9,000 acres is utilized by the company. All the features are fully described in the book mentioned. Profuse illustrations serve to impress the reader with the greatness of the plant, the various units constituting the great steel plant being fully dealt with.

* * *

Becker Steel Agency.

William Abbott, St. James St., Montreal, has been appointed sole Canadian agent for the Becker Steel Works, Krefeld, Germany, maker of high grade tool steels, high speed chrome nickel, nickel and tungsten alloy steels, and high carbon steel tubing. The special features of this company's products are the employment of the Girod electric melting process which practically eliminates the phosphorus and sulphur in the steel and of strong hydraulic pressure on the liquid steel in the molds, producing a uniform product that does not vary materially either in analysis, tensile strength or elasticity.

Lack of uniformity in all classes of high carbon tool steel results in difficulty in tempering and hardening which is entirely eliminated by the process used in making the Becker steel.

An artistically colored catalogue is being issued by Mr. Abbott, containing particulars as

* * *

New Pipe Mill.

The Page-Hersey Iron, Tube & Lead Co., Toronto, manufacturers of steel and galvanized wrought merchant pipe, has completed and placed in operation a new tube mill at Welland, Ont., its product being 2¾-inch to 8-inch lap weld pipe, as well as boiler tubes and well casing. The various buildings are all of fireproof construction. The main or mill building consists of steel underframe with corrugated iron sides and roof, the finishing buildings being constructed of solid brick with cement floors, the reinforced concrete roof being supported by steel trusses. The dimensions of the various buildings are as follows: Main building, 80 x 200 feet; finishing department, 50 x 140 feet; socket department, 35 x 120 feet; storage department, 50 x 140 feet; machine shop, 35 x 120 feet; gas house, 30 x 66 feet; stock crane runway, 50 x 380 feet; coal trestle, 300 feet long.

The tube mill machinery was built by the United Engineering & Foundry Co., Pittsburg; the furnaces by the American Furnace & Machine Co., Pittsburg. The mills are electrically driven by individual alternating current motors of General Electric construction, the power to drive the works being furnished by the Ontario Power Co., of Niagara Falls. The present output of the plant is 75 tons of finished pipe per turn.

* * *

W. D. Beath & Son to Enlarge.

W. D. Beath & Son, Toronto, were incorporated in Sept. 1909 with an authorized capital of $100,000. This company proposes to purchase a property on a railway siding and build suitable buildings for for their products, the present premises being too small to accommodate the workmen and machinery necessary for the needs of their business. The estimated cost of the new plant is about $10,000.

The products to be manufactured include Beath's overhead tracks, carriers and hoists, steel kegs, shipping packages, hardware specialties, sheet metal of all kinds. They will also carry on a general business of iron and steel masters and iron founders, builders' supplies, etc.

The officers and directors are:

W. D. Beath, President; L. B. Beath, vice-president; M. E. Gibson, accountant, secretary-treasurer; T. H. Mace, C.E., M.E., engineer; J. H. Milnes, president the Milnes Coal Co., Toronto.

Beath's overhead tracks is a carrying system run on overhead tracks, and is used for the economical handling of the products of manufacturing concerns in their factories and warehouses, in the various stages of manufacture. A number of the Canadian manufacturing plants successfully using the system are: The American Chicle Co., F. H. Fleer & Co., Cosgrave Brewery, all of Toronto; J. Fleury's Sons, Aurora; The Metal Shingle & Siding Co., Montreal; The Toronto and Belleville Rolling Mill, Belleville, and The Empress Manufacturing Co., Vancouver, B. C.

* * *

C.G.E. Annual Meeting.

At the annual meeting held in Toronto recently, W. R. Brock, president, pointed out that since the close of the year the marked improvement in volume of orders received has been maintained, and present trade conditions warrant the belief that this improvement will continue.

The company within the last two or three months has secured some of the most important contracts for electrical apparatus ever awarded in any country, totalling nearly two hundred thousand horse-power. These include three generators of 15,000 horse-power each, three generators of 12,500 horse-power each, and two of 11,000 horse-power each, and for size and importance have no counterpart in the world today, and it should be gratifying to the shareholders that this company is in the foremost rank as manufacturers of high-class machinery of such magnitude.

The Canada Foundry Co. has just satisfactorily completed for the Canadian Government, at St. Andrew's Rapids, near Winnipeg, a movable dam of steel construction that is one of the most important engineering propositions yet undertaken in Canada, and have recently entered into a contract with the Dominion Iron and Steel Co. for the construction of their new blast furnace plant.

All departments of the Canada Foundry Co. are now back to normal production, the structural steel department being overtaxed. As they have had to forego much business for this department, because of insufficient capacity, the directors decided to provide for a largely increased output and negotiations are now pending for the acquirement of a suitable location for the extension of this department.

During the year the bank account was reduced below $300,000, at which time our accounts receivable amounted to nearly $2,000,000, but the rapid influx of orders necessitated the purchase of large quantities of raw materials, no less than $400,000 of such materials, principally iron, steel and copper, having been received during the month of December, with the result of increased borrowing to a moderate amount.

The great development of the Canadian Northwest made it increasingly difficult to handle the business of that district from either the Vancouver or Winnipeg branches, and the directors arranged to open a new branch office in Calgary, Alberta, which is now in operation.

* * *

C.P.R. Work in the West.

Three new buildings will be erected by the C.P.R. in Calgary this year and large additions will be made to two others. The passenger station will be increased qy the erection of a new wing, which will be almost 200 feet long and 35 feet wide. An addition to the freight car shop will be built 100 feet long. This is a brick building and the addition will also be of brick. A stores building of standard design will be built, 70 by 30 in size, and there will be a new engine house of 18 stalls and a new machine shop.

In Regina there will be built a large brick freight shed, 450 feet long. In Moose Jaw there will be built an addition to the present frame freight shed, 200 feet long. Weyburn will have a new freight building 100 feet long, and similar buildings will be erected at Granum and High River.

Large new stations of special design will be erected at Red Deer, and at two of the resorts in the mountains, namely Banff and Laggan. At Lethbridge, the present station building will be greatly enlarged, the addition praposed being 80 by 30 feet in size. At Coleridge and McLeod there will be six stall additions to the engine houses, and at Medicine Hat there will be new brick machine shops, 72 by 82 in size. In addition to these buildings, for which special plans are prepared, the C.P.R. will erect in the western division, new stations of standard design at Morse, Rush Lake, Marquis, Keeler, Loreburn, Strongfield, Glenside, St. Aldwyns, Tyvan, Erskine, Strome, Brocket, Cowley, Lundbrek, Welsh, Shepard, Hilcrest, Blairmore, McGillivray, Natal. Between thirty and forty new section houses will also be erected during the summer, by the company in the division. Tenders for

these various buildings are now being called for, and the contracts will be awarded in April.

On the central division there is less work of this class to be done, the only structure for which tenders are now being called being the new station at Minnedosa, Manitoba. This will be a small building of exceptional design and of a size corresponding to the business done in tht town. In addition to the building required for the actual business of the company, the C.P.R. is at the present time asking for tenders for the erection of the new railway Y.M.C.A. building at Cranbrook. This structure is to cost $26,000, and will be very similar in appearance and design to the Y.M.C.A. building in Kenora. It will be of frame, however, and will be a little less expensive than the Kenora building.

* * *

CATALOGUES.

TURRET LATHES.—Gisholt Machine Co., Madison, Wis., Catalogue ; size 8 x 10 in. ; pages 64. This is the company's 1910 catalogue, describing and illustrating the Gisholt turret lathe and its accessories. Six views showing the increase in the size of these lathes from 1885, when the first one was built, to the present time, occupy two pages in the front part of the catalogue. These are followed by illustrations of the six regular sizes and the four big-bore lathes. There are also a number of engravings showing the different classes of work turned out on this lathe and installations in machine shops in various parts of the country.

THERMIT.—Goldschmidt-Thermit Co., 90 West Street, New York. Bulletin on repairing steel and iron rolls by the themit process, illustrating the fractured rolls, the mold, the wax pattern in position, the apparatus ready for making the weld and the finished weld.

CHUCKS.—Cushman Chuck Co., Hartford, Conn. Condensed catalogue and price list for 1910 of Cushman chucks and face-plate jaws. Cushman chucks are made in a large variety of styles and sizes adapted to all classes of machine work and general manufacturing.

FORGE FURNACES.—Catalogue 8 from W. S. Rockwell Co., Hudson Terminal Bldg., 50 Church St., New York, contains data and description of Rockwell forge furnaces operated on oil or gas.

POWER PUMPS.—Catalogue No. 7 from Smart-Turner Machine Co., 191 Barton St. E., Hamilton, illustrates and describes the many styles of pumps manufactured by them to suit the purposes for which they are intended. These pumps use belt, motor, steam or gas engines as motive power as desired. A line of gas engines built by them is also included in the catalogue.

FUEL AND GAS BURNING APPLIANCES.—Catalogue 3 from W. S. Rockwell Co., Hudson Terminal Bldg., 50 Church St., New York, contains illustrations and descriptions of many of the appliances included in their extensive lines. Among them are high and low pressure oil burners, oil pumping systems, blowers, steam separators, pressure tanks, oil hose, etc. A number of valuable tables on melting points, weights of metals, S. G. of metals, etc., is also given.

RUBBER BELT CONVEYORS.—The Jeffrey Mfg. Co., Columbus, Ohio, have just issued booklet 35 which contains numerous illustrations and explanations of Jeffrey instalations. Prices are given for the various designs. Prices are also given for rubber, leather, cotton and canvas belting.

METAL MELTING FURNACES.—The Monarch Engineering & Mfg. Co., Baltimore, Md., in a 32-page catalogue, describes its extensive line of crucible tilting furnaces for melting ferrous and non-ferrous metals, ladle heaters, core ovens, mold dryers and portable heaters for lighting cupolas. The crucible tilting furnaces are adapted for melting and refining foundry metals, both ferrous and non-ferrous, including brass, bronze,

copper, nickel, aluminum, tin, lead, ferro alloys, manganese, silicon, vanadium, iron, etc. Among the furnaces shown, is one of the pre-combustion tilting type, which is arranged with a supplementary rear chamber for receiving the flame from the burner, and which is deflected against a baffle block. An article on the use and abuse of crucibles contains pertinent information regarding the handling of pots, and should prove of interest to many foundrymen. In addition, formulas of standard foundry mixtures are also included. The catalogue will be sent on request.

WATER TUBE BOILER.—The "Sneddon" water tube boiler is the subject of a catalogue issued by Howson, Weld & Co., Sheffield, manufacturers of Lancashire, Corliss and multitubular boilers, feed water heaters, etc. The London, Eng., representative is T. F. Cowbrick, 49 Queen St., E.C. The "Sneddon" boiler is fully described, the treatise being illustrated, making a very interesting production.

PRESSURE GAUGES.—Bulletin 114 from the Bristol Co., Waterbury, Conn., deals with Bristol's recording gauges for pressure and vacuum. Full descriptions with prices, charts, etc., are given.

CONCRETE BLOCKS.—The Dominion Concrete Co., Kemptville, Ont., have issued an illustrated catalogue on coated paper dealing with concrete blocks for construction purposes, also one on concrete culverts.

MECHANICS' TOOLS.—The Keystone Mfg. Co., Buffalo, have issued catalogue No. 18 describing and illustrating ratchets, taper sleeves, drilling posts, wrenches, etc., and giving price list.

LIGHTNING PROTECTIVE APPARATUS.—Circular 1152, containing 60 pages from the Canadian Westinghouse Co., Hamilton, contains a full description with illustrations, tables, line drawings and explanations of lightning protective apparatus and accessories.

MACHINE TOOLS.—The Burke Machinery Co., Cincinnati, Ohio, have issued a 1910 calendar and price list of machine tools including milling machines, slotting attachments, saw grinders, sensitive drill presses, tapping machines, shapers, hydraulic pressure pumps, oil forges, etc.

BAR WORK.—Mussens, Ltd., Montreal, are mailing a neat booklet on bar work issued by Alfred Herbert, Ltd. It describes the Patent Roller Steady Turner of the Alfred Herbert Hexagon Turret Lathe. It is printed on coated paper, and contains a great deal of information on turret lathe work. The cover is very attractive, being an arm holding a finished piece of bar work.

WEIGHT OR POWER.—Alfred Herbert, Coventry, England, have issued an exceedingly neat catalogue under this heading suggesting that there is a better factor than weight for determining the right value of a machine tool. These booklets are being mailed by their agents, Mussens, Ltd., Montreal. Milling machines of several designs are illustrated and described. The description is a reprint from an article in "The Engineer" under the heading "Purchasing Milling machines by Power."

RUBBER BELT CONVEYORS.—Booklet 35, recently issued by the Jeffrey Mfg. Co., Columbus, Ohio, contains numerous illustrations of Jeffrey installations and equipment. Prices are given for various designs and also for rubber, cotton, leather and canvas belting.

FANS.—Veritya Ltd., 31 King St., Covent Garden, London W.C., England, have issued booklet 608 dealing with fans of several types for summer use. They are designed to run at standard voltages, 110, 220, 480, 500, etc. Ventilators, desk fans, regulators, etc., are also described in the booklet.

COMPRESSORS.—A pamphlet from the Mesta Machine Co., Pittsburg, Pa., illustrates and describes a standard Mesta Corliss driven air compressor.

AMMETERS AND VOLTMETERS.—Bulletin 1181 from Westinghouse Electric & Mfg. Co., Pittsburg, Pa., describes portable D.C. and A.C. ammeters and voltmeters operating on the D'Arsonval principle with permanent magnet and moving coil construction.

HYDRAULIC VALVES AND FITTINGS.—Is the title of a 120 page illustrated catalogue just issued by the Watson-Stillman Co., 50 Church St., New York. Its pages list a great many types and combinations of hydraulic valves and fittings. Almost every page contains some hint or advice as to the best piping arrangements, what types or combinations of valves are best suited to certain work, how the valve arrangement may operate a number of cylinders or machines automatically, etc. Any engineer will find this book handy when figuring on new hydraulic installations or making changes on old ones. This book will be sent free to any one requesting catalogue No. 78.

STEAM TURBINE.—Circular 1094, 40 pages, from Canadian Westinghouse Co., Hamilton, is a very complete description of the Westinghouse-Parsons steam turbine, its origin and development. It is a very interesting and instructive treatise, fully illustrated.

BOOK REVIEWS.

"A Study of Base and Bearing Plates for Columns and Beams," by N. Clifford Ricker, Bulletin No. 35 of the Engineering Experiment Station of the University of Illinois. This bulletin contains formulas and tables for use in designing steel and iron plates of the usual forms. Copies of Bulletin No. 35 may be obtained gratis upon application to W. F. M. Goss, Director of the Engineering Experiment Station, University of Illinois, Urbana, Illinois.

CANADA'S LEADING TOOL HOUSE

Sizes 8 to 18 inches.
Flat and half round.

The DREADNOUGHT MILLING TOOL (The tool that supersedes the file)

It cuts 3 to 5 times faster than an ordinary file and with less effort, and outlasts 5 to 10 common files—can be re-sharpened several times without drawing the temper—it will not choke on soft metals and will take hold of a greasy surface. For LATHE work the Dreadnought is without a peer; it will finish the surface far superior to a bastard file and equal to the smoothest file. WRITE for CIRCULAR and PRICES.

ARMSTRONG

TOOL HOLDERS
ALL SIZES

Machinery Wanted and For Sale

RATES

One insertion—25c. for 20 words; 1c. a word for each additional word.

Yearly rate—$2.50 for twenty words or less, 10c. word for each additional word.

The above does not apply to notices under the head of "Machinery Wanted." These notices are inserted free for subscribers.

BELTING, PACKING, ETC.

BELTING, RUBBER, CANVAS AND LEATHER, Hose Packing, Blacksmith's and Mill Supplies at lowest price. N. Smith, 138 York Street, Toronto. (2tf)

MANUFACTURING CENTRES.

FREE FACTORY SITES—Seven railroads, deep water, Niagara power, natural gas, low taxation, abundant labor. Welland, Ontario. B. J. McCormick. (12y)

RUBBER STAMPS, ETC.

B. CAIRNS, MANUFACTURER OF RUBBER stamps, stencils, steel stamps, burning brands. 77-79 Queen Street East, Toronto, Ont. (tf)

MACHINERY FOR SALE.

MARINE GASOLINE MOTORS of unexcelled quality; jump spark type; two to eighteen horsepower; pleased to show our motors; send for new catalogue. Midland Engine Works Company, Midland, Ont. (1-11)

ONE 34" Oesterlein Plain Milling Machine, new. Kellogg & Co., 196 King St. West, Toronto.

3½ H. P. Gas Engine, complete with accessories, in first-class order. Kellogg & Co., 196 King St. West, Toronto.

FOR SALE—1 Gurney Scale Co. Foundryman's Testing Machine, with deflection indicator. Good as new. Standard Ideal Co., Port Hope.

SHOP AGENT WANTED.

WE want an agent in every machine shop in Canada where fifteen or more men are employed, to take subscriptions to this Journal. Subscriptions are easily obtained and the work can be carried on by giving a few minutes to it in the noon hour. Liberal commissions allowed both for new subscriptions and for renewals. Write for terms. Agents' Dept. CANADIAN MACHINERY, 10 Front St. East, Toronto.

FIRE PROOF SAFES, VAULTS, ETC.

YOU need the best possible protection from fire! If your valuables are in one of our safes you can rest at ease; no fire is too hot for our safes and vaults to withstand. We manufacture vaults and safes to meet every possible requirement. Write for catalogue "S." The Goldie & McCulloch Co., Ltd., Galt, Ont. (tf)

MISCELLANEOUS.

AT LAST—A really practical pencil sharpener. The "Spiro" sharpener built on a new principle, positively does not break the lead. Ten blades. Sharpener lasts lifetime. Every pencil user needs one. Pencil sharp in a second. Ask your stationer or write us direct. A. R. MacDougall Co., Canadian Agents, Toronto.

A BOOK-KEEPING STAFF IN ITSELF—doing the work with machine-precision and accuracy, the National Cash Register. Write us for demonstration literature. National Cash Register Co., 285 Yonge St., Toronto.

ANY MAN who has ever lost money in the mails has had occasion to learn by painful experience that the only proper way to remit money is by Dominion Express Money Orders and Foreign Drafts. If lost or delayed in the mails, a prompt refund is arranged, or new Order issued without further charges. (tf)

MISCELLANEOUS.

COPELAND-CHATTERSON SYSTEMS — Short, simple. Adapted to all classes of business. Copeland-Chatterson-Crain, Ltd., Toronto and Ottawa. (tf)

DOUBLE YOUR FLOOR SPACE. An Otis-Fensom hand-power elevator will double your floor space, enable you to use that upper floor either as stock room or as extra selling space, at the same time increasing space on your ground floor. Costs only $70. Write for catalogue "B." The Otis-Fensom Elevator Co., Traders Bank Building, Toronto. (tf)

ELLIOTT-FISHER STANDARD WRITING-ADDING MACHINES make toil easier. Elliot-Fisher, Limited, Room 314, Stair Building, Toronto.

FASHION DECREES. Holland Linen correspondence stationery correct in style. Its beautiful writing service most attractive. Envelopes to match. Fashionable sizes and colors. Visiting cards, Invitation and At-Home cabinets and writing tablets. Ask your stationer. W. J. Gage & Co. Ltd., Toronto.

ERRORS AVOIDED—LABOR SAVED—Using the Shouperior Autographic Register. Three copies issued at one writing. 1st, invoice; 2nd, delivery ticket; 3rd, charge sheet, perforated for filing. No handling of carbons. High grade printing and neat invoices. Make full inquiry. Autographic Register Co., 191-193-195 Dorchester St. East, Montreal.

ELIMINATE fire risk, save insurance, reduce maintenance costs and save money on your actual building work by using the Kahn System of Fireproof Construction. Used in many of the largest business premises on this continent. Write for catalogue. Trussed Concrete Steel Company of Canada, Limited, Walker Rd., Walkerville, Ont. (tf)

FIRE INSURANCE. INSURE IN THE HARTFORD. Agencies everywhere in Canada. (tf)

FREE TEST. Prove our claim that "Klear Copy" Carbon gives the best, clearest, unsmudged copies of all typed matter at our expense. Send for sample package "K" free. Peerless Carbon & Ribbon Mfg. Co. of Canada, Limited, 180 Richmond West, Toronto.

GET THE BUSINESS. Increase your sales. Use Multigraph Typewritten letters. The Multigraph does absolutely every form of printing. Saves you 25 p.c. to 75 p.c. of your printing bill. Multigraph your office forms, letterheads, circular letters. Write us. American Multigraph Sales Co., Ltd., 129 Bay St., Toronto.

MODERN FIREPROOF CONSTRUCTION—Our system of reinforced concrete work, as successfully used in many of Canada's largest buildings, gives better results at lower cost. "A strong statement," you will say. Write us and let us prove our claims. That's fair. Leach Concrete Co., Ltd., 100 King St West, Toronto. (tf)

MR BUSINESS MAN, are you progressive? It's up to you to test "Consolidated," our new process carbon paper. Because it costs less. Soft finish, without smutting, and clear, permanent copies. Write for sample sheets and prices. "Consolidated," Stratford, Ont.

SAVE 50% OF THE COST OF HANDLING merchandise by installing a Beath System of Overhead Carriers. Saves valuable floor space because the trackage is on the ceiling. Systems for all kinds of businesses, large or small. Write us for illustrated catalog. W. D. Beath & Son, 193 Terauley Street, Toronto. (tf)

SCOTCH PLAID STATIONERY is the latest creation for business and society correspondence. Paper and envelopes present a finished linen surface, most agreeable to the pen touch. Leading sattioners have it. Write for samples. The Conp, Clark Company, Ltd., Toronto. (tf)

if you are a subscriber to "Canadian Machinery," by sending in to us the specified number of new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.

Pattern Making

By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions

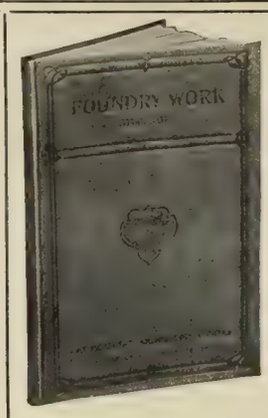
Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

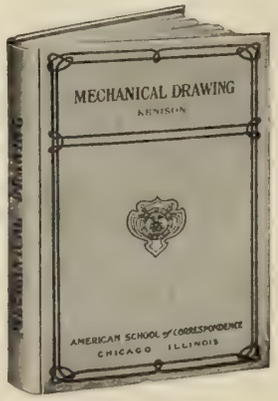
Price, $1.00

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology



176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

A GOOD INTRODUCTION IS OFTEN VERY PROFITABLE.
WE WANT TO INTRODUCE YOU TO
S. M. S ?
Swift Metallic Stopping
THE BRITISH FOUNDRY CEMENT
IT is used for filling up blow-holes and sand-holes in Cast Iron or Steel Castings.
IT is supplied in powder form and mixed for use with a little water to a stiff paste.
IT dries on a casting in 1 hour, and can be filed up bright in from 6 to 12 hours.
IT is specially useful to all Engineers, Machinists, Foundrymen, etc.
It is of British Manufacture.

SMOOTH-ON

TRADE MARK-REG. U. S. PAT. OFF.

Pump Repaired with Smooth-On Iron Cement No. 1 six years ago, and still in use.

Write for circular showing how work was done.

SMOOTH-ON IRON CEMENT No. 1

is prepared in powdered form—for use mix with water. It is unequalled for stopping leaks of Steam, Water, Fire or Oil, because it becomes metallic iron that has the same expansion and contraction as iron, thus keeping tight at all temperatures. Engineers and Foundrymen use it where a smooth surface and metal-like hardness are desired.

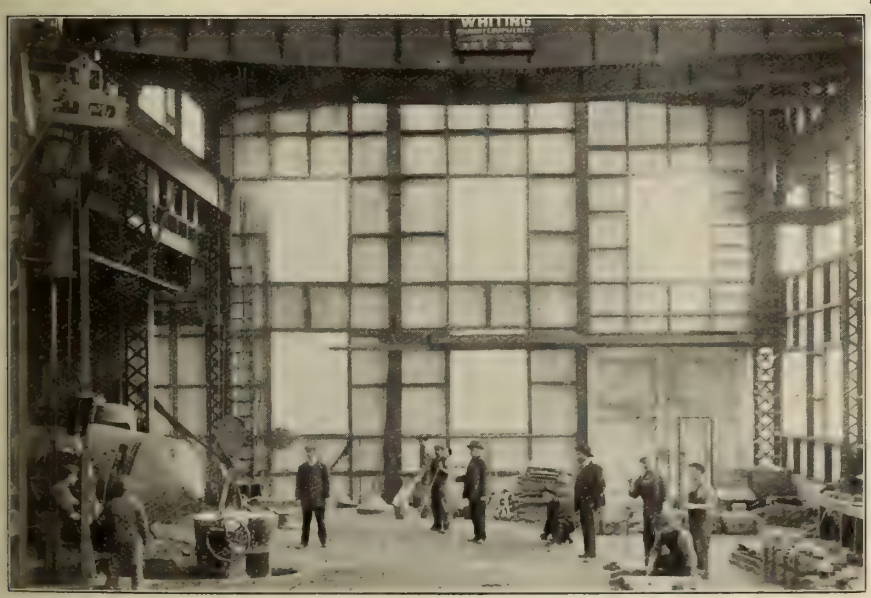
SOLD IN BLUE LABEL CANS

Send for Illustrated Catalog and Prices of the Different Smooth-On Cements

Smooth-On Manufacturing Co.

JERSEY CITY, New Jersey, U. S. A.

FOR SALE BY SUPPLY HOUSES



Steel Foundry, Vancouver Engineering Works, Vancouver, B.C. Complete Equipment Furnished

Whiting Electric Travelers and Oranes of all kinds

Constructed for Service

Scientific Design, First-class Construction, Improved Brakes, Movements under perfect control.

COMPLETE EQUIPMENT FOR FOUNDRIES

Grey Iron, Brass, Car Wheel, Pipe, Malleable and Steel.

Buildings Designed. Equipment Installed. Complete Plant Delivered to Purchasers Ready to Operate.

If it's Foundry Equipment, think of "Whiting"

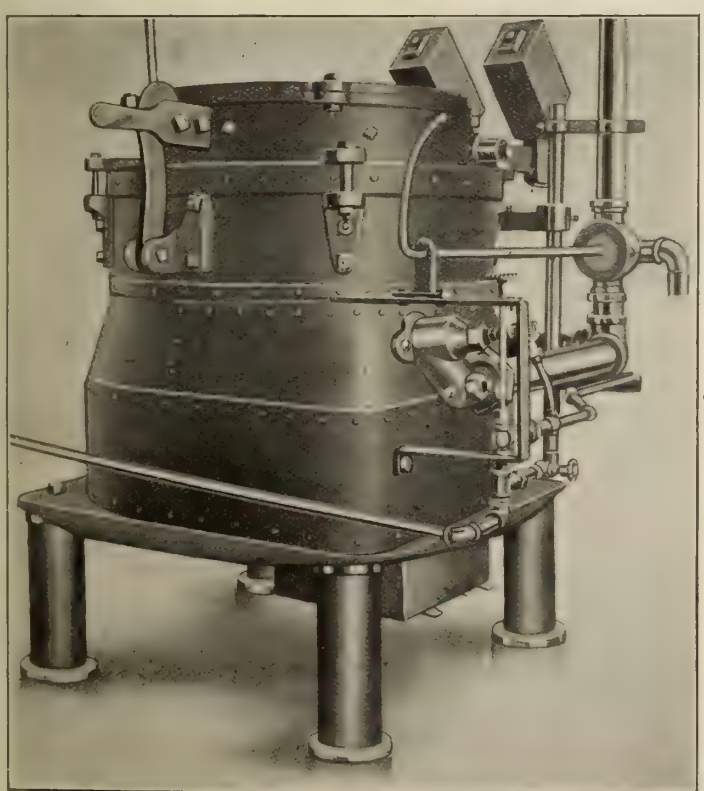
SCRUTARI TRUST
MONTREAL

HAVE A PLAN. The man who is satisfied with what comes to him unsolicited answers few knocks at the door. The stay-at-home misses daily opportunities that pass at the next corner. Get away from the desk—get out of the chair-tilting class. Opportunities are in perpetual motion. Get after them. Lay out a plan, a campaign for new business—then go after it. Exhaust every source, swing every prospect into line. Don't be satisfied with the business that you have—get more.—System.



Send for ur new Catalog and read what some Canadian and a host of American Foundrymen say about it.

Are You Satisfied with Your Melting Furnace?

LISTEN!

The Fisher Crucible Fuel Oil Furnace

IS THE KING OF OIL FURNACES

Built in Sizes from 100 to 350 Crucible Capacity.

WE GUARANTEE MELTING COST from 40 to 50 less than with other fuel, with little or no shrinkage in metal.

"IT'S UP TO YOU"

To prove that the Fisher Furnace will SOLVE YOUR FURNACE PROBLEM we will INSTALL ONE in your plant ON TRIAL without the least obligation on your part.

LET'S TALK IT OVER

ALFRED FISHER

103-5-7-9 West Monroe St., CHICAGO, Ill.

DISAPPOINTED
IN FOUNDRY PROFITS?

You are the one we **like to get in touch with.**

OUR
GRAVITY
Molding Machine

OUR
JAR-RAM
Molding Machine

Will turn your loss into a profit.

OUTPUT INCREASED — LABOR REDUCED

We are installing "HAUCK" BURNERS rapidly.
They are great Money Savers, for Riveting Bending, Drying Ladles, Etc., Etc.

"ACME," PARTING and RED FACING are invading more Foundries every day.

Ontario Wind Engine & Pump Co. TORONTO AND WINNIPEG

STRETCHING THINGS

I am mighty careful not to stretch the facts in these publicity efforts.

You see, I base all my statements from information received from practical foundrymen, who know the subject.

I have reports from more than fifty progressive Foundrymen who say my KING KORE KOMPOUND is a new era in economy, in investment of money, in time-saving and in saving of castings. If there is now any one whose detail differs from the majority, I make it to fit his case.

It's the same way with GENUINE EAST INDIA PLUMBAGO, the only Lead any foundryman can afford to use.

With the Core Compound goes STEVENS' CARBON BLACKING, the ideal core-wash; there is no trouble, when making hollow castings, with this combination.

I manufaoture FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES.

A HEART TO HEART TALK
ON FOUNDRY EQUIPMENT AND SUPPLIES

When Aristotle was once asked what a man could gain by uttering falsehoods, he replied: "not to be credited when he shall tell the truth."

The above quotation is intended to impress upon you, Mr. Buyer, the truth of the following statements :—

Is it not a fact that, since our advent in the Foundry Equipment and Supply business, the quality of the goods and service have improved ?

You, like ourselves, have noticed advertisements (competitors') raving about price-cutters. It was intended for us—probably because our way—the proper way of merchandising our goods—interfered with the nice, easy do-as-you-please order of things.

Did we cut some prices ?

Yes, because in following out our fixed policy of fixed prices—the same for all—and it may be that we stepped on somebody's toes. However, we do not apologise—it was intentional.

How could we ?

Our purchases are made in the open market at opportune times, and always from direct sources. You, Mr. Buyer, get the benefit.

Francis Hyde & Company

MONTREAL, P.Q.

Permit us to suggest that it is to your interest to discuss the sand question with us.

JONATHAN BARTLEY CRUCIBLE CO.

TRENTON, N. J., U. S. A.

MANUFACTURERS OF

Crucibles of Quality

Mr. Brass Foundryman:

Quite a number of Brass and Iron Foundrymen are using our Detroit Core Compound in as high a ratio as 75 of sand to 1 of Compound, and producing cores which are quite open, which do not blow, and readily rap out of the casting.

Ask the Empire Mfg. Co., of London, they use it and are saving money by so doing. A sample for the asking.

We manufacture Tripoli, Lime Compositions, Coloring Compositions, Polishers' Friend, Emery Cake, Rouge, etc.

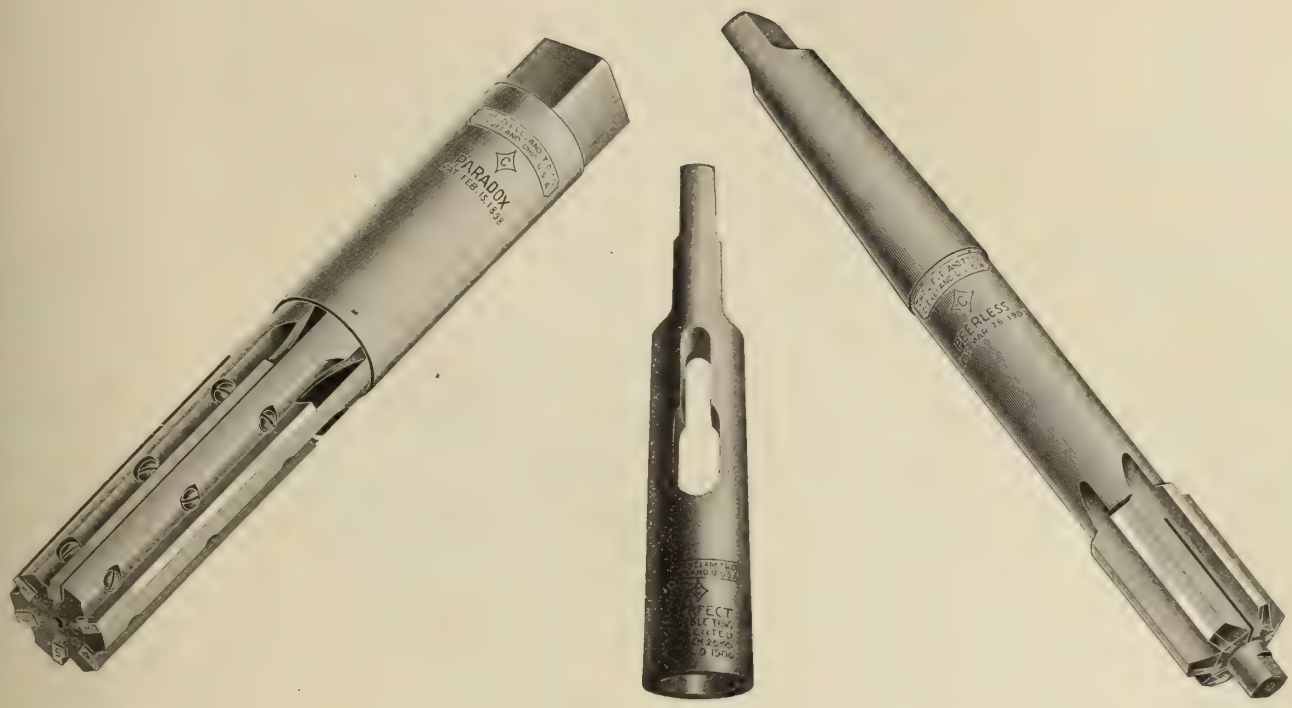
THREE CLEVELAND TOOLS POINTING TOWARDS ECONOMY



Parado Adjustable Reamers

The Life of a Paradox Reamer is Nine Times that of an ordinary reamer. (A fact proven by actual statistics covering a long period of trial.)

Compare its price with that of your nine solid reamers and there can be no doubt of

ECONOMY No. 1

Perfect Double-Tang Sockets

A simple, strong and absolutely effective cure for tang trouble in taper shank driving. Uses up your broken tang drills. Doubles the life of your new drills.

Compare its costs with that of your drills thrown away because of broken tangs.

ECONOMY No. 2

Peerless High-Speed Reamers

Peerless Reamers can be run two or three times as fast as carbon steel reamers.

They are tougher and outlive a Solid High-Speed Reamer.

Figure up the labor and time saved on any big job, and you have

ECONOMY No. 3

Be sure you get the "P" it means Economy

The extended Knee Slide and the rigid support of the spindle on the

No. 5 B Heavy Plain Milling Machines

make the taking of exceptionally heavy cuts a feature of the machine.

The knee side extends to the top of the frame and supports the front bearing of the spindle. The heavy walls of the frame securely house the spindle. This reduces to a minimum the possibility of any spring in the bearings.

A Large Amount of Power

is available at all times owing to the large diameter of the driving pulley and the exceptionally wide belt, which gives high belt speed and large belt contact. The Constant Speed Drive feature adapts the machine for motor drive and allows for full efficiency at all times.

HARBISON-WALKER

The Standard *of* Quality

FIRE BRICK FOR CUPOLA LININGS

Do you figure *prices* per thousand brick or fire brick *costs* per ton of iron melted?

If the latter, we can help you. Our foundry records show it. Let us take it up with you. Quality tells.

BOILER SETTINGS

The grade that practically insures your settings when running overload, whether hand fired or mechanically stoked.

Your request will bring Catalog and full information.

220 Factories—in 72 Lines of Manufactures

Low Taxes; No Labor Troubles; Abundant Supply of PUREST WATER on the Continent; Eleven Banks; A Beautiful City to live in.

WESTERN UNIVERSITY **NORMAL SCHOOL** **MILITARY SCHOOL**

London Treats its Manufacturers Fairly

WRITE FOR FURTHER PARTICULARS TO

S. BAKER,
City Clerk

LONDON, CANADA

DO YOUR BELTS STRETCH?

We can just hear you say:—"Of course, **all** belts stretch." We will admit that if you don't specify the amount of stretch. We will **not** admit there are any leather belts that stretch less than ours.

Our Belts Stretch Less (by 15% to 25%) Than Any Others

Why? **Because** we take more care in stretching before the belt is made up.
Because none of the unstretched parts are used in the make up.
Because other makers smooth out this unstretched part and use it in their belts, and when the load comes on **that part is bound to stretch.**

Why pay for a lot of belting you have to throw away in little bits at a time, to say nothing of time lost in taking up slack?

Specify **"Extra," "Standard"** or **"Acme Waterproof"** and get prices from

MACHINE TOOLS
OF
HIGH QUALITY

Lathes, Drills and Pipe-Screwing Machines

GAP LATHES—16, 18, 20, 24," in any length of Bed.

A Gap Lathe for a Jobbing Shop is an almost absolute necessary Machine Tool.

The improvements embodied in our Lathes made for absolute solidity and steadiness of cut.

The Brace under Carriage allows Gap diameters to be turned at High Speeds with resultant work as good as can be done on an Engine Lathe of large swing.

Double Back Gears give a range of Spindle Speeds which are all found useful.

Our extra large belt surfaces, combined with specially heavy spindles, ensure highest efficiency both in quantity and quality of work

We invite the closest scrutiny of materials, workmanship and finish, and have adapted Highest Quality as standard from which we will not deviate.

Particulars, yours for the asking.

LABOUR-SAVING MACHINE TOOLS

MANUFACTURED BY ALFRED HERBERT, LTD., COVENTRY ENG.

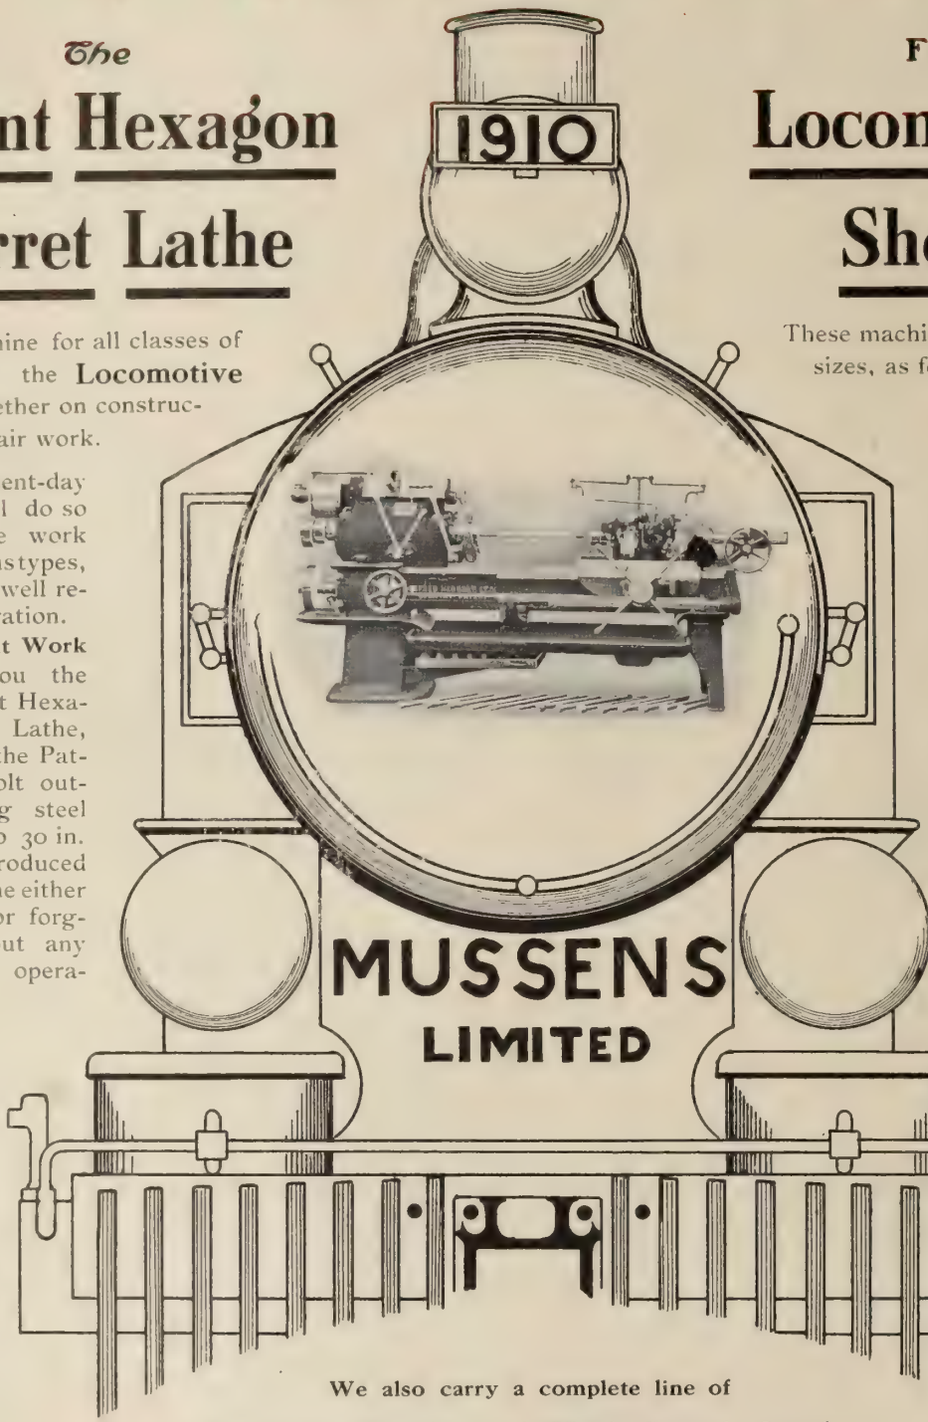
The

Patent Hexagon Turret Lathe

is the machine for all classes of bar work in the **Locomotive Shops**, whether on construction or repair work.

The present-day machine will do so much more work than previous types, that it will well repay investigation.

On Stay Bolt Work we offer you the No. 2 Patent Hexagon Turret Lathe, fitted with the Patent Stay Bolt outfit, enabling steel stays up to 30 in. long to be produced in record time either from bars or forgings without any subsequent operations.



FULL PARTICULARS FREE ON REQUEST

For

Locomotive Shops

These machines are built in three sizes, as follows :

No. 1 — 1½" x 21"
No. 2 — 2¼" x 30"
No. 4 — 3½" x 42"

Below we give particulars of a recent test carried out on the No. 2 Patent Hexagon Turret Lathe :—

Material — 30-ton mild steel.

Reduction in diameter, 2" to ¾".

Speed of Work — 158 ft. per minute.

Weight of Metal Removed — 7¾ lbs. per minute.

We will be pleased to give a guarantee of output on receipt of samples or sketches

We also carry a complete line of

Machine Tools and High-Speed Steel

Rapid Bar Production

in Exact Duplication

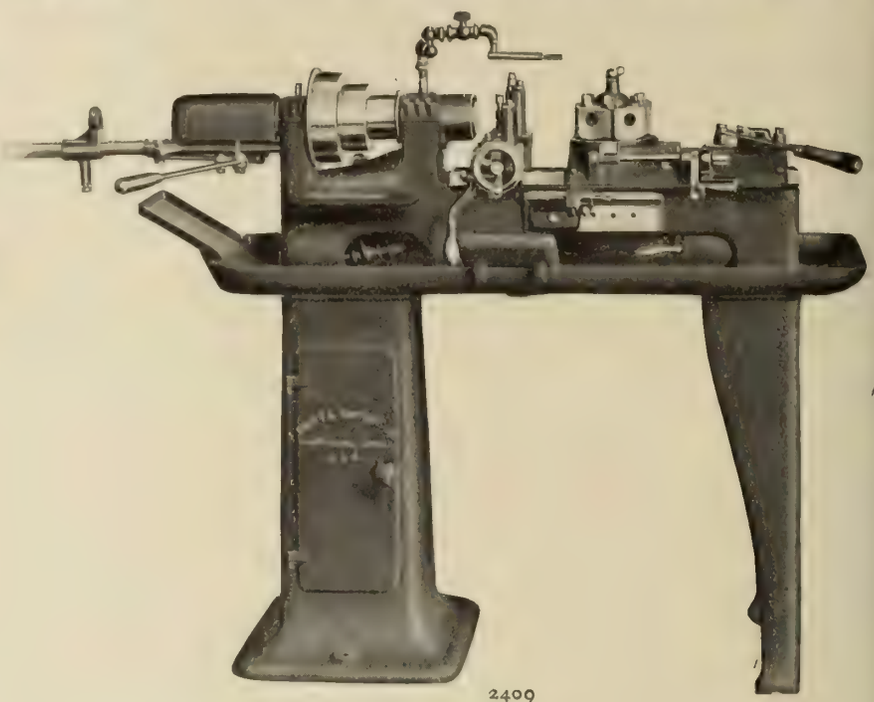
The P. & W. Turret Lathes

A series of bar machines that are capable of a class of work in accuracy beyond that which it has been supposed or known could be produced on turret lathes. To obtain this end it has been necessary to make liberal use of many refinements of construction not generally employed in other machines of this class.

A number of exclusive features also have been introduced to promote convenience and rapidity in operation, facilitate making ready for given work and enable the machines to be economically used for the production of small lots as well as large lots of work.

Tool equipment is adjustable to a very wide range of work to meet the ever-changing manufacturing demands.

Five Sizes: $\frac{5}{8}$ x 4½, 1 x 10, ½ x 18, 2 x 26, 3 x 36 in.



2409

P. & W. 5 x 4½-in. Turret Lathe.

Westinghouse Individual-Motor Drive For Machine Tools

No progressive manufacturer can afford to disregard the advantages of individual-motor drive.

It means that machines can be equipped with motors to operate them continuously at exactly their highest producing speed, resulting in the greatest output, and, owing to the absence of shafting and belting, the friction load is practically eliminated, resulting in a marked saving in power. Other results, not to be underestimated, are the increased safety and the improved conditions in operation.

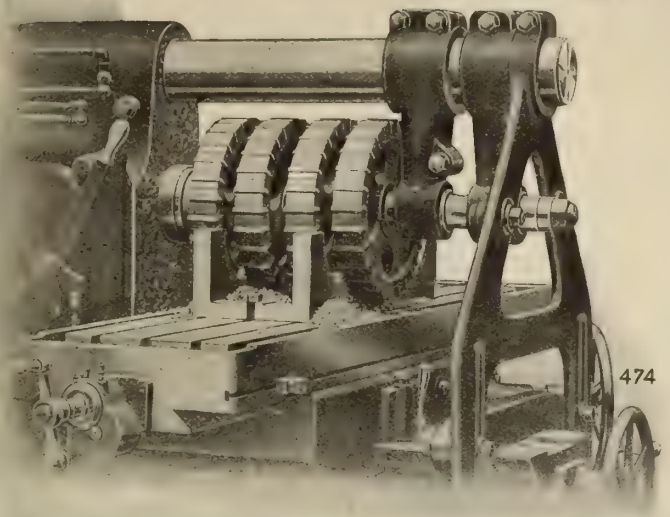
Willlams & Wilson, Montreal — A. R. Williams Machinery Co., Montreal, Toronto, Winnipeg

The No. 4 Plain High Power Cincinnati Miller



direct connected to a 10 H. P. variable speed motor, milling grey iron castings.

The cutters are 13½" diameter, high speed steel, run 13½ rev., taking a cut ⅛" deep across eight surfaces, having a total width of 23" at a feed of 4" per minute, This amounts to 11½ cubic inches of iron removed per minute, and even this is not the limit of the capacity of the machine, but is all that the cutters will stand.

This is evidence of the tremendous capacity of this new line of millers. We make four sizes: No. 2, No. 3, No. 4 and No. 5.

Ask for our High Power Miller Catalogue.

THE MILWAUKEE

No. 3B Universal Miller

is one of a line of Plain and Universal Milling Machines for heavy duty service having great weight and structural strength in comparison with range. Powerful drive through single pulley as shown or at right-angles. Electric drive applied without difficulty at any time. All gears and bearings automatically flooded with oil. Every machine equipped with pump for cooling and lubricating the cutters and with means provided for returning the cutting lubricant to its reservoir. Wide table for jig work with ample bearings for maintained accuracy. Accurate screws with sensitive graduated adjustments—all adjusting and feed screws have ball thrust bearings. Dividing wheel double the size usually used—accuracy equal to the best.

Williams & Wilson - Montreal

A PLANER WITH A SPEED VARIATION 10/180 FEET PER MINUTE

Has it ever occured to you that your planer might do a lot more work than it does, that it is expensive to run, its upkeeping in belts is higher than in any other machine because it wastes power in stopping and re-starting in the opposite direction at the end of every stroke? That if a belt breaks, the table will run off and do a lot of damage? That you ruin a lot of tools because you cannot run it slow enough when cutting a hard piece of cast steel, or waste time because you cannot run it fast enough when cutting a soft piece of brass? That you cannot rely on it stopping at exactly the same place every time and thus break tools if you are planing a dead-ended slot?

We are not selling planing machines, but we have an electrical drive which we can fit to your present planer or to your new one, which it will pay you to investigate. The "Lancashire" Planer Drive is fool-proof, and will enable you to increase your return strokes' speed to at least 180 ft. per minute with a table weighing 12 tons, and give you a speed variation of from 10 to 180 ft. per minute on your cutting stroke by simply turning the speed regulator handle to the speed you want. Furthermore, it stores up the energy generally wasted in stopping and reversing the table, and uses it during the next stroke. The table will stop at exactly the same spot, and there is no possibility of it running off under any circumstances. It is not like the old type of electrical planer drives with a 3 to 1 speed variation and with an expensive set of controller contacts to renew every six months. The "Lancashire" system is good for either direct or alternating current, has standard speed variation of 18 to 1 and will not cost you 50c. a year in renewals.

This Barrel Leaks Your Money

¶ Every wooden shop barrel you have is leaking away your money. You are paying more than you used to for wooden barrels — but even when you bought them cheapest you were really losing money that you might have saved with our STEEL SHOP BARRELS.

¶ Steel Shop Barrels you'd need, cost just about what you would pay for wooden barrels used during a year. But the second and third, and maybe other, years you would buy no barrels at all. That looks like 100% a year saving, doesn't it?

¶ Besides, our Steel Shop Barrels are easier to handle, take up less room, look better, and don't fall apart when you are not expecting it—or any other time.

¶ Even a small shop can save hundreds of dollars a year with our Steel Shop Barrels, Boxes, and other money-saving things for factories.

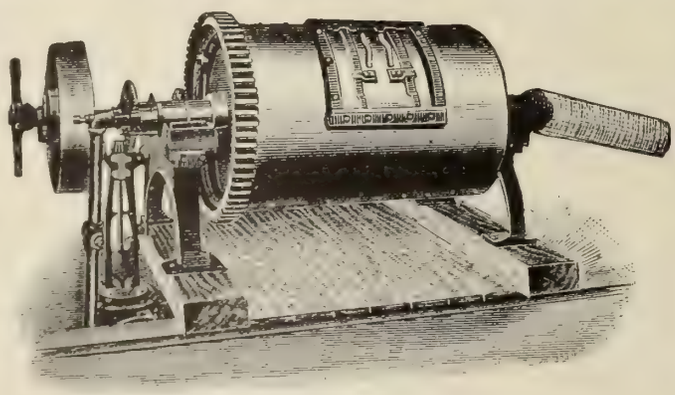
A GOLD MINE

SAVE YOUR IRON



SLY'S PATENT IRON CINDER MILL

Patented, No. 514097. Patented, No. 841728.

may be at your disposal on your very premises. Look out of your side window or back door and see if you have not an accumulation of cupola dump, and other foundry refuse, which is a total loss to you in its present state. Why not add to your profits and install one of the Sly Patent Cinder Mills to reclaim this iron and be astonished at your former loss and pocket the rich returns from your newly-discovered mine.

Sly's Patent Iron Cinder Mill will save 95% of the coke contained in your cupola dump, and gangway scrapings. Iron is valuable, then why throw it in the dump? Iron recovered by this Mill is better than machinery scrap. Study economy in a foundry and your profits will increase accordingly. Mill will pay for itself three or four times every year, and we have records of Mill paying for itself twelve times a year. Let us know amount of your daily melt and we will quote. *Write for Cinder Mill Catalogue F.*

We also manufacture Cleaning Mills. Dust Arresters, Sand Blast and Foundry Equipment.

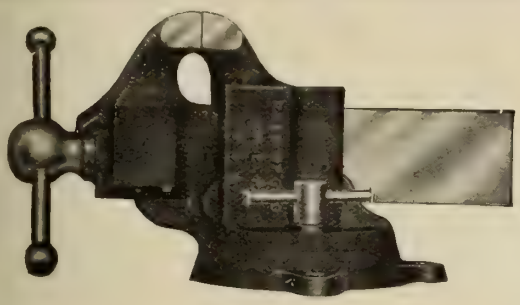
Swivel Base Type

Hollands Vises and Tools

have been recognized as standard quality for twenty years, and are used exclusively in many of the leading Industrial and Railway Shops in Canada and the United States.

Hollands Manufacturing Co. - Erie, Pa.



You Can't Break Reed Vises

No matter how hard you hit. They are built from experience gained by breaking tests in our own shop, and no man who buys one need fear that it will go to the scrap heap from breakage, which is the usual cause for its going there.

The Vises are made with a degree of care and detailed attention which would make them cost a great deal more if it were not for the large quantities in which they are made. All surfaces are machined to limit gauges so as to insure snug fits and long wear. There are no high spots to wear down and make a loose fit and give lost motion.

If your dealer cannot supply them, write us.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our ware house in all current sizes, flat, squares and rounds; annealed and unannealed.

Chisholm & Moore Chain Hoists

We have been appointed Canadian Distributors for the Chisholm & Moore Mfg. Co., of Cleveland, Ohio, and are carrying a complete line of their famous hoists at our **Montreal, Toronto, Winnipeg** and **Vancouver** warehouses.

The Chisholm & Moore line includes—

"Cyclone" High Speed Chain Hoist

The highest speed Chain Hoist made. Shows 80 per cent. efficiency. Has fewer parts than any other.

Moore Anti-Friction Chain Hoist

An old favorite, recently improved with a new and very efficient automatic brake.

Standard Screw Hoist

A powerful, easy-working block. No vibration. All working parts protected. Always hangs plumb.

Direct Differential Pulley Blocks

Simplest of all hoists, with fewest working parts.

All sizes from ½-ton to 5 tons in stock.

JOHN MILLEN & SON, Limited

321 St. James Street - - MONTREAL

Blount's Wet Tool Grinder

A Most Efficient Tool

It is fitted with self-oiling bearings and can be run continuously if desired. A *vertical* centrifugal pump furnishes a constant supply of water, the propeller being so loosely fitted that it does not touch the case at the nearest point; there is, therefore, no wear of parts, nor is the grinder affected by grit or dirt. A sleeve cap prevents leakage without the use of packing.

Send for further details. Complete satisfaction guaranteed.

J. G. Blount Company

EVERETT, MASS., U.S.A.

Grips Like Grim Death !

THE "RUSSELL" DRILL CHUCK

ANTI-FRICTION

is remarkable for the ease with which it is adjusted, and for the tenacity with which it grips. It is self-tightening and entirely automatic in its action. Ball-bearings eliminate all friction, and it has interchangeable jaws, perfectly accurate. The only chuck that will hold straight-shank drills without slipping.

Made in 5 Sizes. ***Write for Catalogue.***

A New Circular Cutter Head

THIS ILLUSTRATION is a section taken from the **J. A. FAY & EGAN CO.'S** No. 61 C Hand Planer and Jointer, with the tables drawn back, giving the reader an idea of their New Safety Circular Cutter Head.

This new Cutter Head closely fills the opening between the tables, so that the most severe accident that could possibly happen would be the scraping of a finger or thumb.

The design is such that the cutting edges of the knives protrude but slightly from the circumference of the cylindrical-shaped head, and thus permit the tables to be set very close to the cutter.

You are requested to write the Manufacturers for their new Catalog No. 81, which illustrates and describes their New Safety Circular Cutter-Head in full

Making an Annual Saving of Thousands of Dollars

By Practicing Economy in the Locomotive Repair Shops, Thousands of Dollars are Saved—The Stock Room and Various Shops are Large Fields Where Large Saving of Waste may be Made.

By W. R. Smith*

THE subject upon which I have endeavored to compile this paper is a very broad one, in fact there are very few railway problems upon which there has been more comment and discussion than that of economy in locomotive repair shops. Possibly, on account of the Mechanical Department not being directly a revenue bearing department, greater attention has been paid to it as regards the organization in its various branches, than to any other department, in connection with railroad work. To bring this matter before you in detail would occupy a very considerable length of time, therefore, I shall only mention points which are of the greatest importance in connection with shop practice.

Storing Materials.

The first of these which I wish to bring to your notice is the storing of material, particularly heavy material, such as tyres, boiler plate, tubes, bar iron, etc., etc., all these should be located as near as possible to the shop in which used, and stored in properly erected buildings or racks, suitable for the purpose required, thus reducing delay on the part of the shop staff to a minimum, and at the same time placing such material under cover that would otherwise be subjected to atmospheric conditions, causing the material to depreciate in value, on account of corroding and pitting, thus reducing the length of service and thereby increasing the cost of the manufactured article. The buildings referred to should be thoroughly equipped with small cranes or lifting devices, to eliminate hard labor and facilitate rapid handling. The use of magnetic power on locomotive cranes now in use in the majority of modern plants, has proved very effective, and has been found to be a labor saving device. It would not be an extensive plant that would not require at least twenty men to perform duties of this nature, without proper facilities, which could be handled by the use of a crane of this type with about five men, effecting an approximate estimate in wage economy of about $8,000 per annum.

You will, therefore, see that the saving would aggregate a much higher figure than would be considered credible by those not conversant with engine repairs. There is one other point on the material question, through which the mechanical department can be subjected to numerous inconveniences and disadvantages, detrimental to the working progress which of necessity terminates in increased expense; I speak of the purchasing and supplying of the proper quantity and quality of material at the required time, it being a very essential feature in economy. In this particular line of railway business, it appears to me, after personal experience of several years with four different railroad companies, that if those in authority in such matters, acted as far as consistent in supplying the make or quality of material specified by the head of the mechanical department, it would assist materially in economy. It can be readily understood that it is practically impossible for the latter to obtain the best results, in frugal efficiency, without the support of the purchasing department. The fact cannot be denied, however, that cases do occur, through some neglect or oversight on the part of the mechanical department, in not advising the stores or purchasing officials of the consumption of an unusual amount of a certain class of material, or the necessity on the part of the latter to place an order for a commodity which it has not previously been customary to carry in the ordinary stock, thus placing that department in an unfair position through not being allowed sufficient time to obtain delivery.

Tracing Orders.

One matter to which strict attention should be paid is the tracing of orders for material after being placed. I could relate instances where it would be impossible for a mechanical department to correctly account for excessive charges through failure on the part of a manufacturer to supply material within a reasonable time. As we know the manufacturer's tendency is to grasp all the business possible, with the result that it frequently takes double the necessary time to get deliveries made. I have known cases where six months has been taken where thirty days under ordinary circumstances should be ample time. This is an expensive proposition and one that should not be tolerated by a railway company, as the ultimate cost is perhaps one hundred per cent. more than the actual value. This and other questions of a similar nature prompt me to state that the most improved business methods possible to adopt, relative to these three departments, are in the best interest of the company.

In referring to what is conceded by many to be the principal cause of high figures in mechanical labor, being that of the present standard rates of wages, we are all aware that conditions in this particular have made a wonderful advance in the past ten years.

Still expensive locomotive repairs must not always be solely attributed to this fact, as there are comparisons for consideration in what might be termed the ancient and modern methods in applied mechanics found in shop practice.

The rapid strides accomplished in the mechanical sphere of late years are more than equal to those which have taken place in any one particular in railroad records.

It is well said that time is money, and in this age of comparison, rapidity should be the point at issue in every performance in locomotive repairs, in order to keep pace with the records which are now being continually made, in modern shop efficiency.

I do not purpose entering upon a discussion of the numerous improved appliances, but by way of comparison I remember only a few years ago, in what was at that time one of the largest shops in Canada, where an employe welding boiler tubes after ten hours of strenuous labor would have about 100 tubes welded

To-day it is possible by the use of certain machines, without any more exertion on the part of the operator, to weld 600 tubes in the same length of time.

Increase Efficiency of Machinery.

Take for instance the enormous amount of manufactured material produced by the use of the modern blacksmith shop machinery.

Then consider the modern moulding department as compared with that of ten years ago, and we find an in-

* General Foreman, Canadian Northern Shops, Winnipeg.

crease in the output ranging from 100 per cent up, and not only a higher grade of casting, but more accurate, requiring less machine work, thereby reducing the cost of manufacturing in every particular, due to the use of moulding machine.

The same progress may be applied in speaking of the boiler shop, as 75 per cent of the operations which were manual labor, a few years ago, are now minor details, through the use of hydraulics and compressed air.

The tool and machine shops have, with high speed steel and high grade improved machinery, shown no small display in the advanced superiority of shop efficiency, and in view of the existence of such conditions, the fact, beyond a doubt is clearly demonstrated, that the adopting of modern methods and such machinery, is of vital importance to a mechanical staff who are expected to compete with the competitors of this decade, for never in the history of railroading has there been such efficiency developed in railroad mechanics, as in that of the past ten years, which goes to prove that all companies to-day occupying an important position in the handling of freight and passenger traffic, must of necessity keep their motive power in first class condition, there being nothing that will reflect discredit upon a company quicker than neglect in this department.

By this it is understood that shop equipment for locomotive repairs is an essential question and should warrant due consideration, in order that economy is brought to prevail, which necessitates close inspection of all details in daily shop practice, as the small matters count in the question of time and labor, which is money, and in the performance of such duties, system is required to be observed in every particular governing the delivering of material to the respective departments, also the disposing of scrap materials, and the various relations between the foremen, in order that the work in each and every department, be advanced to the best interests of all concerned.

Checking Costs.

Another important item in this connection, is the checking of the costs of work performed each day.

In order to have correct information with reference to the cost of locomotive repairs, it is necessary to obtain a daily check, to prevent any mistake being made by the employees on their time distribution slips, which are commonly used in time-keeping in locomotive repair shops.

This places the foreman directly in charge of engine erecting, or machine work, in a position to explain why certain repairs on any particular engine, should cost more than the same repairs on another engine of the same type.

To obviate such difficulties I am convinced that a system adopted about a year ago by A. Shields, Master Mechanic of the Canadian Northern Railway, which is known as the "Engine repair account" and is only used in general repair shops, or what is generally termed "Back" shop, is one of the most convenient methods to be found in checking cost of engine repairs, i.e. from a mechanical department's point of view.

It must be admitted that it entails extra time in Stores' Accountant's office.

It is a system of itemized charges against repairs by the use of consecutive numbers, which are used to specify every piece of work on an engine, and is as follows :—

Accounts—Repairs to Engines.

1. Stripping
2. Repair rods
3. Take off frame R. or L.
4. Repair frame R. or L.
5. Put on frame R. or L.
6. Remove cylinders No.....
7. Apply cylinders No.....
8. Boring cylinders No.....
9. Bush cylinders No.....
10. Repairing cylinders No.....
11. Firebox—new or repairing
12. New front flue sheet
13. New back
14. New inside sheets R. or L.
15. New outside sheets R. or L.
16. New door sheet
17. New wagon top
18. New face plate
19. New throat sheet
20. New crown sheet
21. Boiler
22. Smoke box—new or repairs
23. Washout plugs and holes
24. Tank repairs
25. Remove flues
26. Repair flues
27. Replacing flues
28. Front end arrangement and netting
29. Ashpan and rigging
30. Air pump, air signal and steam heat
31. Driving brake and rigging
32. Driving boxes, hub liners and eccentric straps
33. Repairs to shoes, wedges and horn blocks
34. Deck casting
35. Deck beam brackets and wind sheets
36. Hanging motion and setting valves
37. Repairs to engine trucks
38. Steam and exhaust pipes
39. Dry pipe and throttle rigging
40. Valve seats, bushes and chests
41. Pistons and crossheads
42. Guide bars and blocks
43. Spectacle plate
44. Repairing valve gear and motion
45. Driving tires, wheels, crank pins and axles
46. Boiler mountings, injectors, pops and lubricators
47. Lagging
48. Jackets
49. Piping
50. Engine bell
51. Headlight
52. Smoke stack and base
53. Front end ring and door
54. Expansion and running board brackets
55. Springs and spring riggings
56. Wheeling and putting up binders
57. Pilot, buffer beam brackets and front coupler
58. Cab running boards and deck floor
59. Sand box, dome casing and hand rails
60. Painting engine and tender
61. Tank frame repairs and draft gear
62. Trucks and brake rigging
63. Miscellaneous

Stripping an engine is account No. 1, repairing rods account No. 2, and so on ; the highest number is 63, it being a miscellaneous account which covers all extra or unusual charges.

It is worked in this way :—

Presuming a machinist has worked all day on boiler mountings (account 46). On his time slip he writes the date, engine number and 9 hours account No. 46, which is all that is necessary.

Each morning all slips are collected from ticket boxes and charges recorded by the mechanical department, previous to sending slips to the timekeeper.

The form used for this purpose has the dates printed on the top line and the account numbers on the right side, so that all that is necessary, is to place the amount charged under the date and opposite the account number.

There is one form for each engine in the shop for each month.

By this you will understand that at a glance, the cost of labor on every piece of work in the shop can be obtained daily. Charges for material, of course, can only be got at the end of each month, when accounts are closed by the stores department.

It is understood of course, that due credit is received for scrap material.

Some companies use the shop order system : In this, every piece of work has a different number, being confusing on account of high figures, which would run into the thousands every month.

With the account system, a certain piece of work on every engine is always the same number, with which the employes become familiar and thus avoid mistakes on their time slips.

It may be possible to improve on this system, but I must say, if properly carried out, it is the best arrangement in the interest of the mechanical department that I have used.

Value of Trade Papers: How to Derive Benefit from Them

The Greatest Loser is the Reader who Carelessly Thumbs over the Pages—Technical and Trade Papers Should be Handled Methodically.

By One Who Reads Them.

I OFTEN wonder what subscribers and others who receive various trade publications do with them. I know of some who "get them," look them over carelessly and throw them aside; their disposition, mental and other needs, possibly their capacity for acquirement of features of value, not being sufficiently pronounced to force them to a realization of the wonderful worth to-day incorporated in these publications—and in this I do not mean wholly to indicate the reading matter or editorial columns, for, from my point of view, there is not a single column in a trade paper of the present time that is uninteresting.

It is astonishing when we consider the value given to the assembled sheets of paper. How we must praise the modern progress made in the art of printing and illustrating! How few understand, when they subscribe for the average trade paper and pay the price asked for the regular sending of the publication, that their subscription, instead of meaning a profit to the publisher, actually means that the publisher is to lose money in supplying it, for the service given by the leading trade papers now costs more than the return as represented by the price of the subscription. Thus the subscriber gets something, yes, much, for nothing, but still the publisher willingly bears his loss, as he needs readers to give value to the advertising columns. In other words, circulation counts, and it counts for a very great deal from the publisher's standpoint, even though the advertisers should always reserve the right, and persist in it, to criticise the quantity in a demand for quality. Quantity without quality will bring disappointment. That, however, is another story.

The Careless Reader the Greatest Loser.

A subscriber who receives his paper, carelessly glances over it as he applies thumb pressure to shoot the leaves along, stopping only to casually and quickly read a paragraph, a note here and there, does not do himself or the publisher justice He will be the greatest loser. The publisher will get just as much money from him, but he will fail in acquiring the exceedingly valuable fund of information the publication brings to him. And the more of this information he gleans the higher and better will be his appreciation of the publication. The faithful, energetic editors work hard to have the pages up to date in the data they carry. Type forms and illustrations are carefully studied in order that the appearance may be of the best, each thoughtful attention in this direction being intended to hold interest on the part of the reader. Many fields have been searched for the actual news and scientific information placed before the subscriber by the editors, who are very materially helped on the larger number of pages by the men who write and plan the advertisements.

The subscriber who looks upon the advertising pages of trade publications of to-day as tales of purchased space makes a very serious mistake. These advertisements are developed by able minds in every part of the country, each one of which seeks to educate the subscribers of the trade publication to the latest and best practice in a particular line. Publishers of trade papers have high morals; they scan every bit of copy that comes to their office determined that their readers shall be protected from advertisements that make false claims. Occasionally a fake assertion that has a new feature may creep in unknowingly, but as soon as the deceit is made apparent the columns of honest papers are forever closed to that business. And the average reader does not know how many advertising men there are who are cautioned not to call on this or that concern whose business by the publisher is deemed undesirable.

Handling Trade Papers Methodically.

Let me advocate a higher appreciation of the trade paper. Let me tell of one progressive company and its realization of the importance of thoroughly reading what the editors and others have to say in these factors of this modern industrial growth. The company to which I refer receives a very large number of trade and technical papers, but it makes easy the reading, handling and disposition of them. They are all first handled and opened by the one who distributes them to the department or employe most vitally interested in the various publications. For instance, an engineering publication first goes to the company engineer; a paper that has to do with power is sent to the mechanical department, as are also machinery papers; the electrical papers go to the electrical engineers, except papers that carry patent references, which first go to one who scans the patent report to see if any of the late issues have to do with fields in which the company operates, and if so, this department immediately sends for these patents of interest; papers that are associated with the chemical, electrochemical, electrometallurgical field all have their readers; automobile publications go to various departments, as do those devoted to military affairs, while the same may be said of marine, paint, power boat and similar fields; all the publications go regularly to individual readers. It is well understood among the employes of this company that they are, in a certain sense, responsible for reading these publications and getting from them everything of present or future interest to the company's affairs. Articles of interest are abstracted, and cards in the following form are made out for filing in a well planned system:

Title .....
.....
Publication .....
Date .....
Author .....
Remarks .....
.....
File under .....

All such cards are sent to the stenographic department and filed. Subjects having any relation to the field in which the company sells its products, or to the use and application of its products, are most carefully covered, so that, for instance, should the company at any time desire information on any of the many subjects it would only be necessary to call for the cards on file and direct that the publications containing the articles or references listed be brought up from the basement for review. To facilitate this review, it may be stated that all the trade papers received in the English language as well as foreign languages are most carefully preserved by means of a filing system, to which a goodly space has been given in a spacious basement, the plan being to bundle each year

of the various publications by themselves. Clipping of the publications is prohibited.

In order to have the publications distributed and pass from department to department, so that all may see them, discover new features or absorb the information of articles marked, each publication is first stamped with the initials of the several readers who are to see them in the course of their transit through office and works, the stamp used being something like this :

J L D	..
K W S	....
D S A	.....
P L M	....
B G R	.
C D E	..
T R F	

A list of publications received and the readers assigned is in possession of each department, so that the course to be followed in sending a publication forward is so well known that it soon becomes a matter of form, each reader checking on the dotted line following his initials. The sales department, the financial department, the chemists,, the superintendent, the engineer, the electrical engineers, the executive department and others are all alert to new things, and it may be guessed that a fund of information is gathered. Then, too, it makes possible the reading up on things in which to-day a company seemingly has little interest, but which is conceived to possess future features of possible value.

Every Item Preserved.

By this system, every item printed in the publications read is preserved, so that when the day comes when the concern wants information on the subject it will only have to turn to its filing system to review all that has been printed. This is a factor of wonderful value, it is believed, as it makes possible a general oversight aided by the many bright minds that write for the publications. It will thus give life to the writings of many editors long after they may be dead.

If one will only consider the immense amount of capital and human energy now devoted to preparing and printing the trade papers which serve as guides in their respective fields, I am very confident there will be a general increase in appreciation of the service performed. It is but fair to admit that the principal trade papers are always ahead of their readers in information. They must be so, for they are teachers ; they tell us of the newest and best things, of the latest practice in many lines, and it is indeed a dull reader who cannot profit by perusal of them. If subscribers will thus cherish their trade papers I am sure there will be an awakening as to their value and of the good they do, of their great general worth and assistance. When subscribers thus esteem their technical and trade papers, they will deserve to have their names enrolled on that monument of quality instead of being considered quantity, which, as I have said, is another story.—Iron Age.

Let us Look Technical Education Square in the Face

Co-operative Education Combining Practical Shop Training in the Shop with the University Course is Suggested as a Solution—It Would Greatly Increase the Value of the Apprentice to the Manufacturer.

By Robert Patterson *

Being much interested in the training of apprentices for the mechanical trade, also in the education of the younger mechanics, any papers, or discussions on the subject, have always been of great interest to me, and when asked to write a paper on some subject I selected this one, not, perhaps, so much with the idea of imparting much new information, as with a view of bringing before you, a subject that is of great importance, requiring careful study and attention of the industrial community of Canada, and those responsible for the proper education of Canadians to-day

> I believe the most desirable for present day needs of Canada is a combined practical and technical education This would meet the present urgent demands, and would create a number of educated mechanics who now receive little or no technical education.

Papers without number, and discussions without end, have been dealt with, to try and settle the question, as to whether the university educated man, or the practically educated man has been the most successful, in giving the best results to their employers and the mechanical world at large Although, there have been numerous university graduates, who have shown great brilliancy, and accomplished much, yet the practical man has not by any means been outclassed ; as to-day, he is probably holding more general positions of trust and responsibility, and quite as many high positions, as his university graduate competitor. With the combined practical and technical education, we have men who are thoroughly conversant with shop practice, labor conditions, organization and the practical handling of men. This, the university graduate does not learn at college or university and in that respect, is much inferior to the man who is technically and practically educated.

However, it is not this phase of the subject I wish particularly to deal with, but technical education of the average mechanic and system of education by which same can be most successfully accomplished as to thoroughness with economy of time.

In this young and growing country of ours, the rapid development of steam and electric roads and the vast increase in manufacturing industries have created a demand for increased and rapid facilities for doing work, and also for producing mechanics able to keep pace with such development. From all appearances, the future will create a still more urgent demand. To meet present and future

* Master Mechanic G.T.R. Shops, Stratford.

requirements, a quick and thorough system of education will be necessary to provide technically trained men.

Men at the head of our public educational system of to-day, have already realized this, and as a result, the boys in our public schools are taught manual training. The system should be in force in every centre in the country. It would greatly help parents and guardians by enabling them to judge of the fitness of the boy for his future profession, mechanical or otherwise. Without this opportunity of judging a boy's qualifications, it is often very difficult to determine what a boy's profession should be. With manual training in his early days, however, it gives additional opportunity to learn whether the boy would be more fitted for engineering or some of the other learned professions. It is a great assistance to the boys who intend to enter the mechanical profession. It teaches the necessity of carefulness and correctness with application of thoroughness in their work that they may attain their desired ends ; also it gives them self reliance and leads them to appreciate honor and have an honest pride in good work done by themselves. It also teaches them to have a desire and respect for all honest manual labor, an attitude of mind which will produce a beneficial effect on the country at large.

At the present day in Canada, it too often happens that from lack of opportunity and facilities, when a boy leaves school, he is unable to continue his studies. This unfortunately results in the education which he already has becoming warped or lost on account of its not being further developed. In a few years, with few exceptions, he is thrown on the world as a journeyman mechanic with less education than when he started to work and practically no ambition to obtain it.

Training Men in the Shops.

To overcome this state of affairs, what step should be taken to make mechanics better acquainted with the technical side of their professional education ? One method is for employers to establish a system of technical education in connection with their works or industries. It is of the first importance to interest manufacturers in the cause of such education. The manufacturer will be the first to be directly benefited as in all branches of industries. we would have a corps of trained young men with more intelligent interest in their work seeking all the time to improve in practice and desiring to become eligible for promotion.

A number of corporations in the United States and Canada have already established technical schools in connection with their shops. The Grand Trunk Railway System in Canada has been a pioneer in this respect and now the C.P.R. also has a school where technical training is given its apprentices. In the case of the Grand Trunk, it was found that to meet the ever increasing demands for skilled and thoroughly trained mechanics, it was absolutely necessary to establish a training school. The boy who had to leave school with only the rudiments of an education from force of circumstances and begin work, had little to look forward to in the matter of education after he once left school. With this system of education, which has been adopted by the Grand Trunk Railway, all apprentices are now fortunate enough to be able to secure a good practical, as well as a technically combined education.

G. T. R. System.

In explaining this system to begin with, an apprentice has to be 15 years of age or over before he can enter the service of the company as an apprentice. He has to receive a medical certificate from the company's doctor certifying that he is physically fit to do the work required of him. He is then put through an examination in the office and practically had to pass an examination in different subjects that would entitle him to enter the first form of our collegiate institutes. He has also to pass an examination to see if his hearing and eyesight is sufficiently good to follow the business.

If he is successful, he is then admitted as an apprentice to the works and is provided with a text book for his instruction and guidance. This book contains examinations for the apprentices for each promotion he takes while serving his apprenticeship. For instance, if an apprentice is being promoted, say from the boiler shop or pipe shop to machine shop and is going to be placed on a drilling machine, he is examined on how this machine should be operated and he has to theoretically explain the method of operation so that, with very little practical instruction, he is able at once to start in and do good practical work but should he fail in these examinations, he is sent back to the shop he came from and the next boy in turn is promoted. He is given another chance, after his first failure, say in a month's time, and if he fails again, he is dismissed from the service for the reason that he is considered either not sufficiently intelligent or too indifferent to make a good mechanic. This practice is followed during his five years' course.

Advantage of Apprenticeship System.

One of the great advantages of this system is that it gets the apprentice thinking and leads him to reading up in line with his work. It is compulsory for all apprentices to attend evening classes two nights per week during the term, at which practical mechanics, mechanical drawing and machine design are taught. An examination of the apprentices takes place over the entire system once a year and examination papers are prepared in which all first, second, third, fourth and fifth year apprentices compete, that is, all the first year apprentices on the system in one class, all the second in another, and so on.

Class prizes are given, also individual prizes, and the keenest rivalry is exhibited, not only among the apprentices individually, but among the different shops as each shop is desirous of having the honor of obtaining the highest average number of marks at the examination.

Remuneration.

At the expiration of apprenticeship before an apprentice becomes a journeyman, he has to undergo a thorough examination to see that he is competent in all the branches of the trade he has been learning. After successfully passing this examination, he is furnished with a certificate of apprenticeship. During his five years' apprenticeship, the sum of 5c per day is retained from his wages. This is refunded to him and a bonus of $25.00 from the company is given him. That with his month's wages entitles him to a snug little sum on the day he completes his five years' apprenticeship. In addition to these privileges, the company has arranged that two scholarships be given each year for competition amongst the apprentices so that the fortunate ones are entitled to a four years' free course at McGill University in any of the branches of engineering or transportation work.

A Co-operative Course Necessary.

But however, I would like to add to this and thereby make the system of training more complete. I would like to see a way opened up at our universities so that young men who have gone through their five years' training as apprentices and not fortunate enough to have won a scholarship entitling them to the four years' free course at McGill University in Engineering or Transportation, might be able to obtain further technical education by a short course, say of one year at our Universities at as low a cost as possible to the student. In this course, he should have the privilege of making experiments, tests,

etc., and a young man who wishes to succeed and obtain a more advanced education, could do so. If such a system as we have on the Grand Trunk Railway were applied to every manufacturing and industrial establishment, the apprentices' rebate and bonus at expiration of his apprenticeship would partly enable him to carry this out and would make him more diligent, attentive and ambitious to become not only a good practical but technical mechanic.

Government Should Provide Schools.

Again, there are some factories or industries not provided with rooms or appliances for education of apprentices or from other causes, could not do so. In these cases, where occurring in towns or cities, the government or municipality should step in and provide night schools, thereby giving them the chance to acquire better technical education to help them in their career through life. As a rule, they have not been able to go very far in their High Schools before going to work, but at least they should have the same opportunities as that of their old school mates destined for professional life but not called upon to leave school at such an early age.

Our High Schools and Collegiate Institutes with all their facilities for education are practically only used six hours per day for five days per week. Why should not these be opened to the young mechanic at night time so that he might further pursue his studies and be educated for his life work. In the majority of cases, good laboratories are used in connection with most of these schools and should be at the service of those who wish to study along that line.

The government should be prepared, and I think it would be the quickest way to get at it, to assist the manufacturers in having the use of these schools.* For instance, any manufacturer giving free tuition that could show an attendance of so many employes ought to receive renumeration so as to bear part of the expense of teaching, etc.

Scholarships assisted by government grants should also be given for these shops, which would entitle the successful student to a scholarship at the university for the one year's short course which I have mentioned. In the larger cities, the government ought to support the universities to such an extent that they would be so equipped so as to take in all mechanical and engineering branches and where sufficient number would make request and where sufficient students would attend to make it successful, all other industries could be represented at the university.

I think a short course at the university as mentioned by me would be of incalculable benefit, for in addition to the actual information which a young man would get in connection with his work which he would be able to take in more rapidly on account of his five years' practical and technical training, he would receive general improvement on account of coming in contact with men of learning and culture for a year. This would not take him so long from the practical work as the four years' course at present, also after the four years' course, he would find so many changes that he would require to go over a great deal of the practical ground again.

To ask that the government should assist in the higher education of the mechanic is not more than right. The government provides colleges for the agriculturist with long and short courses for the farmers, Normal Schools and Faculties of Education for education of teachers in Agriculture and Domestic Science, grants to the universities for student courses in Arts, Divinity, Medicine, Law, Engineering and Mining are also given. Why should a short course of one year be instituted for finishing the education of the working mechanic. We may for all we know have amongst our young men, mechanics or engineers whose genius might equal that of some of the most celebrated of modern times if they only had a chance that a little further education might give them. Let us endeavor to give them that chance not only for their own advantage but for our own as employers and for the betterment of mankind in general. The young mechanic deserves every opportunity of pushing his way in the world as much as the literary man, the minister, the lawyer, doctor, or any other professional men. The educated mechanic is one of the main stays of our Dominion, like the Village Blacksmith of Longfellow :—

> "Each morning sees some task begun
> Each evening sees its close ;
> Something attempted, something done,
> Has earned a night's repose."

In conclusion, I would say that if we combine the practical and technical training of our boys and young men, we would have the best average mechanic who will meet all requirements of these times of rapid progress and development and we will I believe, solve labor problems to a great extent.

* On the Grand Trunk, all tuition is free for the apprentices, they not being under any expense whatever for the education which they get and are paid substantial wages during the time they are working in the shop.

WOMEN AND CHILDREN IN FACTORIES.

A bill is before the Quebec House of Assembly entitled "An act respecting the working hours of women and children in certain factories." Factory inspectors have brought to the attention of the powers that be, the fact that women and children are working eleven hours a day in many places. These hours are too long. There is no need to mince matters—the fact remains, and the only excuse for these long hours seems to be the fact that they are necessitated if sixty hours a week are to be put in and the Saturday half holiday stand.

But why sixty-five hours? Are not fifty-five or even fifty hours plenty? It would not increase the cost of production by any appreciable amount if the hours were shortened and more hands employed. There are still lots of willing—and efficient—workers ready to work if employment can only be had, and in view of this we feel that Quebec has in mind a progressive step in the question of labor legislature.

Large employers of such labor in the Province of Quebec are opposed to the act on the grounds that it would place them at a disadvantage when compared with the manufacturers of other provinces whom the act will not involve. This is a good point and worthy of consideration and brings us to the statement that we believe the act should be made general by emanating from Ottawa. Whatever is wrong about existing conditions in Quebec is wrong about similar conditions in Ontario or any other province and it is up to the Dominion government to investigate and right matters.

We won't go into details regarding the detrimental features of women and children working in factories—they are fairly well known to most of us. The unfortunate thing is that they are compelled to work to live and, as we said before, it is us to our general parliament to see that conditions under which they do work are made as comfortable and as favorable as possible.

It may be that the matter will have been brought to a head—in Quebec at least—by the time this appears off the press. If so we trust that our hopes will be realized and our women and children will not be forced to work eleven hours a day in order to "hold their jobs."

Production Greatly Increased by High Speed Steel

The Proper Treatment of High Speed Tool Steel will Help in Obtaining the Full Efficiency—Forging, Hardening and Sharpening.

By Samuel K. Patteson.

While practically every machine shop owner, foreman, or operator is familiar with the fact that great strides have been made in the production of steel for cutting tools, they are totally ignorant of the means and methods of such production, a knowledge of which would perhaps result in more intelligent use of the tools.

Crucible steel, or the fusion of iron and charcoal in crucibles, has been known from the earliest times, in fact

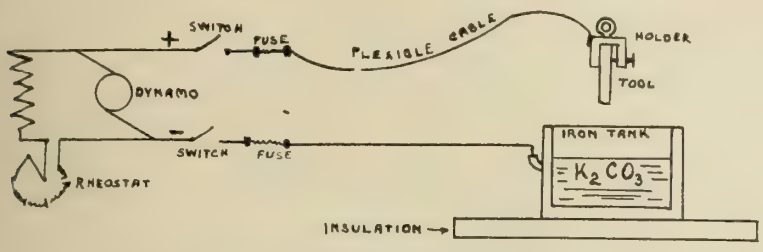

Fig. 1.—Arrangement of Iron Tank for Heating Tools Electrically.

it is a matter of record that the Chinese made steel in this way prior to the Christian era. So far back into antiquity does the beginning of the process go that it is impossible to accurately trace it, but it is hardly conceivable that the ancient races used anything but tool-steel in the execution of the carvings on the hard stones which record their history. It would seem therefore wonderful to the ordinary mind that while the process of making crucible steel was known so long ago, the method and process of manufacture is practically now on the same lines as it was in the old times.

The most important discovery in this line was made by Robert Mushet some forty years ago, who produced a steel containing a percentage of tungsten, and called Mushet steel, which marked a very considerable advance in the manufacture of tool-steel, and for a long time held the first place in its class. Since then practical and scientific men have given their time and thought to experiment and research, with the result that remarkable advancement has been made. Not only has the field of improvement in tool-steel been advanced, but as a result of better grades being produced, experiment has shown that machinery for metal-cutting can be speeded up to almost unheard of velocity, with a consequent increase of work and great economic saving. There are records of work done by modern high speed tools that are almost incredible, as for instance the removal by a planer of a chip 1 inches broad from an armor plate, at a speed of 12 feet per minute, and turning mild steel bars at a speed of 150 feet per minute, with a cut 3-16 in. deep and the feed 5 inches per minute. In this latter case the tool worked from 7 to 8 hours without grinding. Instances have also been cited of cutting speeds up to 500 feet, and grey iron drilled at 25 inches per minute. Comparing these results with the speeds of 25 to 50 feet per minute of the old tools, shows what startling progress has been made.

With these results before them, it is hardly to be wondered at that the majority of operators have embraced the opportunity presented for utilizing such an economic development, and the growth in the use of high speed tool-steel has been almost in a ratio with the increased speed possible as a result of their use. This can be more readily understood when it is recalled that for many years prior to its introduction, there had been but little progress in the manufacture of tool steel or improvement made in its cutting qualities. To those practical minds that were given to thought, must have occurred the hope that eventually a steel of greater cutting possibilities would be produced, and as a result more work, with a corresponding decrease in cost, would be obtained. The developments of recent years have, in a measure, realized these desires, and the wide awake operator of to-day is availing himself of the opportunity.

Iron and carbon are the principal components of modern high speed tool-steel, and in combination with these two are variously used molybdenum, tungsten and chromium, either singly, in pairs or all three in conjunction, and for the benefit of those not entirely familiar with the subject, it might be well to give briefly the various influences of the different metals.

The toughening effect of carbon is well known, as is also the fact that too high a percentage of it will make the steel brittle. Percentages ranging from 0.35 to 0.9 or 1.0 give a very tough steel, and the highest cutting efficiency. Over this percentage the tools are found to be unsatisfactory and are liable to break when the cutting is not continuous, as in planing.

With chromium at percentages of from 1.0 to 6.0, varying results have been obtained. Thus, a low percentage tends to toughen the steel, and tools made from it give excellent results on mild steel and gray iron, but their efficiency was lowered on harder steel. As with carbon an increased percentage of chromium gives a harder steel, but for best results, there must be a decrease in carbon for a corresponding increase in chromium.

Vanadium as a substitute for chromium is not satisfactory, owing to the fact that, while the cutting qualities on medium steel are about equal, the increased cost renders it inadvisable.

Tungsten in High-speed Steel.

Nearly all of the high speed tool-steels now on the market contain tungsten in varying proportions. In one series of experiments on record, the percentages varied from 9 to 27, and it was found that when from 9 to 16 p.c. was present, the cutting efficiency was very high, but the steel was brittle, and no better results were obtained by increasing the tungsten over 16 p.c., which seemed to be the limit for best efficiency. Between 18 and 27 p.c. they became softer and tougher, the tools cutting cleanly, but liable to break down easily.

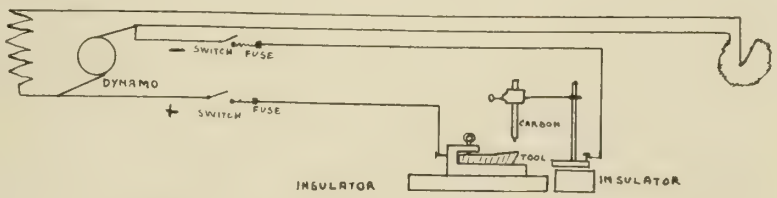

Fig. 2.—Second Method, Utilizing the Electric Arc.

It has been found that where a large percentage of tungsten is necessary to

give a high speed steel, a much smaller percentage of molybdenum will give equally as satisfactory results, and in addition steel containing the latter does not require as high a temperature for hardening, to obtain the greatest efficiency, about 1,000 deg. C. being sufficient, the tools losing in efficiency and life at higher temperature. Molybdenum is, however, comparatively costly, and while slightly greater efficiency is obtained in tungsten steel by the addition of from 0.5 to 3.0 per cent of this metal, the results obtained are not proportionate to the cost.

Silicon has been used in percentages up to 4.0, and up to about 3.0 per cent. perceptibly hardens the steel and increases the efficiency on hard materials. Above that point, howver, there is a rapid fall in efficiency.

Stands High Temperature.

Now the prime requisite of a high speed steel is that it shall be capable of withstanding the high temperatures generated by friction between the tool and the work as a result of rapid cutting. Ordinary steel may be made intensely hard by heating and tempering, but as the frictional temperature increases and reaches approximately 500 deg. F., the hardness rapidly departs. Thus it is necessary, in order to prolong the life of the tool to run at a limited cutting speed, and thus reduce the friction and consequent heating. On the other hand high speed tools are efficient at greatly higher temperatures, even to 1,200 deg. F., and, as the hardening temperature is carried above the critical point, and rapidly cooled, so will the frictional temperature the tool can stand be correspondingly increased. At a temperature of about 700 deg. C. steel undergoes a transformation, and it is with the object of retarding this that such elements as those mentioned above are used. Ordinary carbon steel, or the old self-hardening steels, required great care in heating, as, if either were heated above about 1,600 deg. F. there was great danger of burning and resulting impaired efficiency. In the high speed steel, however, temperatures may be carried much higher, approximating the melting point, it being almost impossible to reduce efficiency by burning. The heating and tempering of high speed steel is, however, an important phase of the subject, and a more than superficial knowledge of it should be sought by those who handle tools of this character.

After the steel has been worked into bars, annealing is probably one of the most important processes through which it goes, and thorough and accurate annealing is an important factor in the production of satisfactory high speed tools. It not only insures a uniform molecular construction, by relieving internal strains due to casting or tilting, but leaves the steel soft enough to be easily machined into any form.

The three principal stages of forging, hardening and sharpening high speed tool-steel for use vary in practice and with regard to the type of steel used, but for general use may be summarized somewhat as follows :

Forging.

It is an absolute essential that the bar be heated thoroughly and evenly, to the centre of the bar, before cutting off. If this is not done and it be cut when cold, end cracks are liable to appear which may gradually extend and produce considerable trouble and loss. After cutting, reheat as before and be sure it is heated throughout, otherwise, if the centre be cold, the steel will not draw or spread out equally, with cracking as a probable result. The steel may be raised to a yellow heat or about 1,800 deg. F., when it becomes soft and is easily forged. When it cools to a good red, or about 1,500 deg. F., forging should be discontinued and the piece reheated. After the required shape is obtained, lay aside to cool.

Hardening temperatures vary in accordance with the class of tool to be dealt with. Thus for planing, turning or slotting tools to be hardened, the point or nose only is heated gradually to a white heat, just short of melting while for gear-cutters, twist-drills, taps and reamers a temperature of about 2,200 deg. F. is required. If the point of the turning or planing tool should become slightly fused, it does not matter, for after cooling in an air-blast, it only requires grinding to restore it to usefulness. Another method of treating these latter tools, is to grind to shape on a dry stone, or emery wheel, after forging, and when cold, after which it is heated just short of melting and cooled as before. Instead of the air blast for cooling the oil bath may be used. In this process the steel is raised to the white heat, without melting, and cooled in an air blast to about 1,700 deg. F., and then immediately immersed in a bath of rape or whale oil. The rough grinding to shape of the tool before heating is advantageous in this latter process, especially where tools with a sharp edge are desired for turret or automatic lathes, brass workers or finishing tools, etc.

Electrical Heating.

In this connection the electrical heating of tools has become an important factor and either one of the following two arrangements may be used for turning or planing tools with satisfactory results. An arrangement of an iron tank containing a strong solution of carbonate of potassium, a dynamo, rheostat, switches properly fused, etc., is shown in Fig. 1.

In this method the current is turned full on and the tool lowered into the liquid until the part to be tempered is immersed. On contact with the solution of K2 Co3 the electric current is completed, and intense heat is generated, and when the tool is sufficiently heated, the current is shut off, the bath serving to chill the steel, thus obviating the use of an air blast.

The other method is by utilizing the electric arc, somewhat as in Fig. 2. In this case the current is derived from a direct current, shunt wound motor of 220 volts, coupled to a direct current, shunt wound dynamo of from 50 to 150 volts, and with this combination arcs up to 1,000 amperes are easily produced and handled by means of the rhtostat. The tool to be tempered is fastened on the positive electrode, and the negative so arranged that the arc will heat the point of the tool without approaching the edge too closely. The current is then turned on and by means of the rheostat gradually increased until the proper heat is obtained, care being exercised not to raise it enough to burn or fuse the tool.

The hardening of milling or gear cutters, drills, screw-dies, taps, etc., is a different proposition and should be done in an oven or muffle-furnace. For this purpose a special design is used, consisting of two chambers, one above the other, both lined with fire brick, and the lower heated by a series of Bunsen burners beneath it. Control of these burners should be had so that the temperature in the lower chamber may be maintained at about 2,200 deg. F., while, of course, the upper chamber is at a much lower heat. After thoroughly warming the tool to be hardened, on the top of the furnace, it is placed in the upper chamber, and heated to about 1,500 deg. F., then placed in the lower one and allowed to reach the temperature of the chamber, or about 2,200 deg. F., at which time the cutting edges present a greasy appearance, and are a bright yellow color. They should then be removed and cooled in an air blast until they may be handled, then plunged into a bath of melted tallow at about 200 deg. F., and the heat of the bath then raised to about 500 deg. F. At this point the tool should be taken out and plunged in cold oil.

A knowledge of these points, therefore, should be sought after by those using these steels, and a better understanding of them will enable an operator to work more advantageously and economically.

When Does it Pay to Instal a Complete New Machine?

In a Paper on "Economical Features of Motor Applications," Read before the American Society of Mechanical Engineers, Charles Robbins deals with the Conditions when Equipping Old Machines with Motor Drive.

When changing over from lineshaft drive to individual motor drive the question arises whether to equip the old lineshaft-driven machines with motors or to install new motor-driven machine tools. The old machines are not as strong in construction as new tools designed for motor drive, nor are they equipped with the latest devices by means of which the time required to make adjustments can be greatly reduced. Owing to weaker construction old machines cannot be made to remove metal as rapidly as machines built with this point in view.

The case taken for consideration involves the modification or exchange of a 72-in. vertical belt-driven boring mill, so as to obtain a greater output at lower cost per unit of product. This mill, the original cost of which was $3,200, has been in use five years. The hourly overhead operating charge has been determined at 91 cents. The machinist receives 35 cents an hour for 54 hours per week (2,808 hr. per year). The total earnings for the year from this machine amount to $4,200. The operating expenses for the year are as follows:—

Overhead 0.91×2,808=	$2,555.28
Wages 0.35×2,808=	982.80
Total	$3,538.08
Net profit $4,200—$3,538=	$662.00

The depreciated value of this tool on a basis of 10 per cent. reduced balance is 66 per cent. of its first cost. If a motor is installed the investment appears as follows:

Value of tool $0.66×3,200=	$2,112.00
Cost of motor, gears, controller, wiring, etc.=	550.00
Total investment	$2,662.00

The hourly overhead charge of 91 cents includes interest and depreciation at 16 cents an hour; the overhead charge exclusive of interest and depreciation will therefore be 75 cents an hour. The depreciation on the new investment for the remaining five years' life of the tool will be 20 per cent. per year, making the charge for interest and depreciation 26 per cent. The operating cost of the old tool with motor drive is therefore:

Overhead (exclusive of interest and depreciation) $0.75×2,808=	$2,106.00
Interest and depreciation, 26 per cent of $2,662=	692.12
Wages, $0.35×2,808	982.12

Assuming 10 per cent. increased earnings, due to adoption of individual motor drives, makes the total earnings:

$4,200 + $420=	$4,620.00

The net profit is then

$4,620—$3,780.92=	839.08

or 31.5 per cent. interest on the investment of $2,662.

The corresponding figures based on the instalation of a new machine tool with individual motor drive are approximately as follows.—

Cost of new tool =	$3,400.00
Cost of motor, etc.=	270.00
	$3,670.00
Scrap value of old tool at 5%	160.00
Investment	$3,510.00
Overhead operating charge— $0.75×2,808=	$2,106.00
Wages as above	982.80
Interest and depreciation for 10 years (depreciation 10% interest 6%) 16%×3,510=	561.60
Total	$3,650.40

Assuming 25% increased output for the year, the total earnings become:

125% × $4,200=	$5,250.00
Net profit is then $5,250—$3,650.40=	1,599.60

or 45.3% interest on the investment.

Conclusion.

The above figures show that for the conditions given, approximately 14 per cent. greater return on the investment is gained by instalation of a complete new tool. It is evident, therefore, that although a somewhat greater capital is required for the new instalation, it is by far the better investment.

A MODERN MACHINE TOOL WAREHOUSE.

Staff Correspondence.

The A. R. Williams Machinery Co., Winnipeg, recently moved into their new premises on Logan Avenue, and at the present time are arranging the display of machine tools on the spacious main floor of the building. The structure is one of the finest warehouses in Canada, being 60 x 130 feet, and four stories high. It is of solid reinforced concrete and absolutely fire proof.

The feature of the interior design is the track facility for loading and unloading machines. Trucks may be driven alongside the large electric elevator on which machines may be loaded and raised to any floor desired. Running from the elevator door on each floor is a heavy steel track made of a single bar of steel about 5" x 1". This track curves around from the elevator and runs the full length of the building making it possible to place machines conveniently at any desired location on the floor.

The Modern Machine Tool Warehouse of the A. R. Williams Co., Winnipeg.

The first floor is utilized for steel drills and large front windows make a fine display of these from the outside. A small but well equipped office is also on the first floor, immediately at the right of the entrance, which is at the side as seen by the accompanying cut. The second floor displays the lathes and other heavy tools, and the third floor stores the bar iron, shafting and accessories. The fourth floor is leased to a stove firm.

IMITATION A SPUR TO EFFICIENCY.*

By Walter Dill Scott.

For the sake of clearness in studying acts of imitation we separate them into two classes—voluntary imitation (also called conscious imitation) and instinctive imitation (also known as suggestive imitation).

A peculiar signature may strike my fancy so that I unconsciously and deliberately may try to imitate it. This is a clear case of voluntary imitation. In writing letters or advertisements or magazine articles, I analyze the work of other men and consciously imitate what seems best. Or I observe a fellow laborer working faster than I and forthwith try to catch and hold his pace.

For precisely similar reasons, a "loafer" or careless or inefficient workman will lower the efficiency or slow up the production of the men about him, no matter how earnest or industrious their natural habits. Night work by clerks, also, is taken by some office managers to indicate a slump in industry during the day. To correct this the individual drags on the organization are discovered and either revitalized or discharged.

> I have seen more than one machine shop where production could have been materially raised by the simple expedient of weeding out the workmen who were satisfied with a mere living wage earned by piece work, thereby setting a dilatory example to the rest; and replacing them with fresh men ambitious to earn all they could, who would have been imitated by the others.

In these instances it is assumed that the imitation is not voluntary but that we unconsciously imitate whatever actions happen to catch our attention. For the negative action, the "slowing down" process, we have the greater affinity simply because labor or exertion is naturally distasteful. One such influence or example, therefore, may sway us more than a dozen positive impulses towards industry.

> To profit from the instinctive imitation of my men, I must control their environment in shop or office and make sure that examples of energy and efficiency are numerous enough to catch their attention and establish, as it were, an atmosphere of industry in the place.

Conditions may limit or forbid the use of pacemakers. In construction work and in some of the industries where there are minute sub-division of operations and continuity of processes this method of increasing efficiency is very commonly applied. In many factories, however, such an effort to "speed up" production might stir resentment even among the piece workers and have an effect exactly opposite to that desired. The alternative, of course, is for the employer to secure unconscious pacemakers by providing incentives for the naturally ambitious men in the way of a premium or bonus system or other reward for unusual efficiency.

To take advantage of their conscious or voluntary imitation, workpeop'e must be provided with examples which appeal to them as admirable and inspire the wish to emulate them. The oldest, simplest application of this principle is seen in the choice of department heads, foremen and other bosses. Invariably they win promotion by industry, skill and efficiency greater than that displayed by their fellows, or by all-round mastery of their trades which enable them to show their less efficient mates how any and all operations should be conducted.

> Judged by the results of the investigation the most common use of imitation is in the train-or "breaking-in" of new employes. The accepted plan is to pick out the most expert and intelligent workman available and put the new man in his charge.

By observing the veteran and imitating his actions, working gradual'y from the simpler operations to the more complex, the beginner is able to master technic and methods in the shortest possible time. The psychological moment for such instruction, of course, is the first day or the first week. New men learn much more readily than those who have become habituated to certain methods or tasks; not having had time or opportunity to experiment and learn wrong

BUSINESS MANAGEMENT.

In this department articles on costs and saving of waste will appear. The *leaks* and *losses* in your factory and my office, are right at *our* elbows, pulling at our cash drawers, threatening our business today. We must be interested, *vitally*, in possible *economies* that will *stop* our *losses*, increase our *profits* and *strengthen* our business.

These articles are to arouse you to inspect your business *now*—to get you interested in *stopping* them — to arouse *thought*, then *interest*, then *action*.

In the June issue will appear in this department an article showing a successful, practical cost system in a manufacturing concern. If Canadian manufacturers are to compete in the world's markets they must *know* their costs and *eliminate waste*. *Knowing* the cost will stir your *interest* in looking for waste and the *elimination* of waste will *reduce* your cost.

Let *Economy* be a watchword and remember: *Doing* is the only thing that gets results.

---

* This article is abstracted from "Psychology of Business," a series of articles in "System," contributed by Walter Dill Scott, Director of the Psychology Laboratory of Northwestern University. This article deals with human efficiency and is based on the experience of executives whose instincts and intuitions are very keen, and give them the understanding of employes' motives and capacities, and suggest methods by which their full powers may be stimulated and used. The article is an important one on the science and art of managing men. For the employe, it blazes the trail to a plane of wider usefulness and greater material rewards. For the employer, superintendent and manager, it points the way to the knowledge and understanding which evokes organization, efficiency and individual power.—Editor.

methods, they have nothing to unlearn in acquiring the right. They fall into line at once and adopt the stride and the manner of work approved by the house.

This is the specific process by which the most advanced industrial organizations develop machine hands and initiate skilled mechanics into house methods and requirements. It has been largely used by public service corporations—street car motormen and conductors, for instance, learning their duties almost entirely by observation of experienced men either in formal schools or on cars in actual operation. Many large commercial houses give new employes regular courses in company methods before entrusting work to them; the instructor is some highly efficient specialist, who shows the beginner how to get output and quality with the least expenditure of time and energy. The same method has been adapted by leading manufacturers of machines, who call their mechanics or assemblers together at intervals and have the most expert among them show how they conduct operations in which they have attained special skill.

> Educational trips to other factories were employed by several firms to stimulate mental alertness and the instinct of imitation in their men. These trips usually supplemented some sort of suggestion system for encouraging employes to submit to the management ideas for improving methods, machines or products.

Cash payments were made for each suggestion adopted, quarterly prizes of ten to fifty dollars were awarded for the most valuable suggestions; and finally a dozen or a score of the men submitting the best ideas were sent on a week's tour of observation of other industrial centres and notable plants. In some instances the expense incurred was considerable, but the companies considered the money well spent. Not only were the men making helpful suggestions the very ones who would observe most wisely and profit most extensively from such educational trips; they brought back to their everyday tasks a new perspective, saw them from a new angle, and frequently offered new suggestions which more than saved or earned the vacation cost.

Business managers, it was made plain, are coming more and more to depend upon imitation as one of the great forces in securing a maximum of efficiency without risking the rupture or rebellion which might follow if the same efficiency were sought by force or by any method of conscious compulsion. Tactfully suggested, the examples for imitation will lead men where no amount of argument or reasonable compensation will drive them. I am, therefore, led to suggest the following uses of imitation for increasing the efficiency of the working force:

In breaking in new recruits they should be set to imitate expert workmen in all the details possible.

Gang foremen and superintendents should always be capable of "showing how" for the sake of the men under them.

The better workmen should, where possible, be located so they would be observed by the other employes.

Inefficient help should be avoided lest the examples of the less efficient should become the model for the larger group.

Educational trips or tours of inspection should be regularly encouraged for both workmen and superintendents.

$10 For An Idea

For the "Business Management" department of Canadian Machinery.

We want ideas for this department—ideas of practical, labor-saving, cost-reducing value. We will pay at regular rates for each idea accepted, and in addition will pay $10 for the best idea submitted during the next five months—that is, until Sept. 30, 1910.

Address all communications to the Editor of Canadian Machinery, 10 Front Street East, Toronto, Ont.

The deeds of successful houses should be brought to the attention of employes.

Where conditions admit, pacemakers should be retained in various groups to key up the other men.

Favorable conditions should be provided for conscious and instinctive imitation for all the members of the plant.

INCREASING THE EFFICIENCY.

The Simonds Mfg. Co., Fitchburg, Chicago and Montreal, believe that efficiency in their plants is greatly increased by co-operation with their men. Carrying out the Simonds policy in connection with their new saw factory at Lockport, they will build at once fifty houses for the company's employes, on the best lines that can be found for dwellings of the type desired, and the settlements will be brought up-to-date in point of perfectness of equipment and completeness and every provision made for the health and pleasure of their employe-tenants.

At the Fitchburg plant the company maintains a club room, recreation room, baths, gymnasium and medical service for its many hundred employes. The company has also established a complete pension system for its employes in its several plants, office force and operatives.

Speaking of all these matters in a more intimate and personal way, a representative of the Simonds Mfg. Co. said:

"Progress along manufacturing lines is to-day based on quality and service. As good as our service was, it was proving inadequate. To win, therefore, that fullest measure of success which we believe we merited demands attention equally to the goods we manufacture, the conditions under which they are produced and the way we treat our customers. The public demand to-day is for the very best of anything that can be produced. The best, it is needless to say, can be made only under proper, i.e., the best conditions. Part of these conditions means affording workmen the greatest advantages in return for increasingly faithful service. It means regulating the physical or purely mechanical features of the establishment in a way that will promote the greatest harmony."

STOCK WISE—LABOR FOOLISH.

By James F. Hobart.

A workman who should know better, and a foreman who is paid for looking after things in general are sometimes guilty of time waste, which is ridiculous when one comes to consider the matter. For instance in the shipping department of a machine shop, I recently saw the head of that department trimming up a stencil, with a scissors, which the machine had not cut clean owing to the extreme thinness of the paper. Ordinary thin wrapping paper had been used instead of the strong thick paper provided for the purpose of stencil-cutting.

Upon being asked why he spent so much time on that work, instead of using the regular paper, the workman replied, that he only wanted a very small stencil and used the wrapping paper to save the regular paper. As the man was working 60 hours a week for $16.50, or 458-1000 cent per minute, two minutes were spent trimming the stencil, at a cost of 916-1000 of a cent. The paper 4 inches wide and 10 inches long weighed 3-16 ounce and at 10 cents a pound cost about 1-10 a cent as nearly as you can figure it. Trying to economize in that way will never prove profitable.

Another instance occurred in a large eastern railroad. The master mechanic wanted a lot of new ratchet drills at a cost of $3.48 apiece, that being the price for which he could purchase 100 new ones. The directors would not listen to the request, but ordered the

master mechanic to rebuild the old ratchets in the shop. This was done, and the cost totaled about $9.80 apiece for the 100 odd rebuilt ratchets.

Instances of this kind can be multiplied indefinitely. They indicate that someone connected with the mechanical industry should make it his business to watch each operation performed by each and every man, from general manager down to water boy, and determine if there is not some other way of making those moves which will save one-half the time, or cost a little less for energy expended in moving. Truly, this is the day of small ecomomies; they must be looked after closely or many little losses will creep in. American Machinist.

STOPPING SHIPPING LEAKS AND SHORTAGES.

Sealed boxes prevent shipment shortages in one factory, says a writer in "Factory." At first sight they appear too frail to stand the wear and tear of the heavier boxes, as the boards are much thinner. However to offset this, the boxes are provided with four or five strong wires with staples securely driven and firmly clinched by machinery. The ends of these wires project at the same edge so that when the box has been packed they are then sealed with a leaden seal.

The box can then only be broken into by breaking the seals or the wires. A glance will then detect this if the box has been tampered with and in this way there is a complete check on the contents while en route.

One company began their use by trying out a sample lot. When the boxes were first used a letter was sent to trace the condition of the box at its destination and it was found that the consignee was pleased with the box. The box weighs about one-half to one-third that of the unwired box and in case of a long haul when it is considered that the average per cent. of the weight of packing cases is with much merchandise shipped to the merchants about 25 p.c. A wire-bound box shipment was a case for Louisville, Ky. The box and contents weighed 165 pounds and the box weighed only 21 pounds or a little less than 13 per cent.

CUTTING DRAYAGE EXPENSE.

By Rube Borough.

During the first years in which I was employed in a carriage factory I was at times a sort of "emergency man." I trimmed shafts, and, whenever the supply of finished shafts piled up in excess of the demand, I was transferred to other departments of the factory work. I wiped out odds and ends of jobs in the "paint shop," in the "blacksmith shop," and I helped out in the crating room.

The company by which I was employed owned its horse and dray and did its own draying. The man who had charge of this work handed in his time at the end of the week to the foreman of the crating room. When not busy with the dray, he helped to crate the finished work.

One week during the summer, while this man was away from the factory, I was given his job. My duty, as I sized it up, was to be two-fold: I was to deliver the crated buggies at the freight depot and was to bring back from the freight depot to the factory the small "sorting up," summer shipments of tires, wheels, seats, bodies, and so on.

My first day on the job was planless. I blundered ahead, drawing to the freight depot in the morning a dozen crated buggies and wasting time at the freight depot doors which were almost constantly besieged during the rush morning hours by dozens of the town's draymen. Also I was delayed several times at side-track crossings.

Late in the morning an incoming train unloaded the first freight of the the day, leaving for the buggy company, a half dozen dray loads of seats, bodies, tires, wheels, etc. In the afternoon I drew this stuff to the factory. I was not delayed—the railroad sidetracks were clear and there were not many draymen at the freight depot doors.

That first day—toward the end of the afternoon—I worked, for not quite two hours, in the crating room.

Now, for results of the first day's work:

First, I must cut in two the number of trips with the dray to the freight depot. I must never have an empty dray behind that horse—it must be loaded with outgoing freight, always, on the way over to the freight depot, and loaded with incoming freight, always, on the way back to the factory.

Second, I must visit the freight depot at a time of the day when switching freight trains and that odd dozen of other draymen should be out of my way.

The second day and the rest of the week, I carried through to a successful finish a program of work as follows: In the morning, work in the crating room. In the afternoon, work with the dray.

By this plan I had three hours more work in the crating room.—Factory.

TIME LIMIT SYSTEM SATISFACTORY.

By W. R. Smith.

I thoroughly believe that the time limit is the correct idea. It is the proper system, but it is governed entirely by conditions. A department cannot give proper results on a time limit unless other departments produce the required efficiency. Before stating a standard time for doing a certain amount of work, you have to check previous records as to what can be accomplished and to find the time required to do that work according to other existing conditions.

The foremen who are in charge of the men in the different departments look over the time slips each morning before being sent to the General Foreman's Office, where they are checked over, and if it is found that a certain piece of work, we will say for instance putting on a cylinder, taking down a frame, setting guides, piston and crosshead work, or whatever the case may be, has cost more than usual or does not compare with previous records, it is immediately investigated as to the reason, so that we are thoroughly convinced that our time records are correct before our time slips go to the time office or audit department.

INCREASING EFFICIENCY OF MEN

By M. E. D.

It is being recognized almost everywhere to-day that the education of the men is necessary to increase the efficiency of the shops. The railroads in both United States and Canada have been leaders and set an example which might well be followed by Canadian manufacturing concerns. Examples of apprenticeship systems on the C.P.R. and G.T.R. have been given in Canadian Machinery. The following is another example of railroad progressiveness and goes to show the value placed by railroads on education of the men.

To increase the efficiency of the men operating its trains, the Pennsylvania Railroad has determined to adopt the use of signal instruction cars on all of its divisions. The divisions on the main line between Philadelphia and Pittsburg have just been equipped.

The company realizes that safety of operation depends upon its employes having a thorough knowledge of all signals, and it has been decided that explicit personal instructions shall be given frequently to enginemen, firemen, conductors and trainmen. The instructions to be given in this signal car will include not only block and interlocking signals, but all other signals used in the movement of trains.

Practical Ways of Obtaining Economy in the Factory

Co-operation Between Men and Foremen, and Managers has Resulted in Large Annual Saving at Canadian Works of National Cash Register Co.

THE superintendent of the Canadian branch of the National Cash Register Co. believes in getting in close personal touch with the work in the different departments. He works on the principle that the shop foremen ought to develop labor saving, cost reducing schemes. The foreman knows his department intimately and with a little incentive, takes pains to think out better ways of doing the work under his supervision.

The superintendent endeavors to develop the workmen and with this in view a rest and reading room has been fitted up where the men may spend a quiet quarter hour at the noon hour perusing such mechanical and educative papers as Canadian Machinery.

Boxes are placed at the stairway leading to the different floors and here the workmen are requested to deposit suggestions which will tend to increase efficiency and economy, increasing the output or reducing the expenses. Perhaps some impractical ideas are submitted sometimes but by explaining to the men why they will not work, other practical ideas are suggested. At any rate, it keeps the men thinking and useful ideas are developed.

The Stock Room of National Cash Register Co., Toronto. A is the Card giving Name and Number of Part. B is card made in Quadruplicate, One Copy being Sent to Stock Department showing Quantity of Stock Ordered. When it Comes to Hand, it is Checked by Stock Men. C is Signal Bell. D Shows Small Boxes Used for the Easy Handling of Parts.

Banner Department.

To stimulate the practice of economy, and habits of cleanliness and punctuality, a banner containing the words "Banner Department" is hung in a prominent place in the department in which the best record is made. At the present time it is in possession of the Foundry Department.

Fortnightly Conference.

Another scheme that has resulted in the saving of thousands of dollars each year is the result of fortnightly conferences held in the reading room. Means of improving the plant are discussed and the suggestions of the men dealt with. Here by the result of planning schemes have been devised which have cut $11,400 from the operating expenses of the factory without impairing in any way the quality of the output.

Saving of Waste.

In almost every factory there is an accumulation of various pieces of factory equipment, stray bolts, shafting hangers, belting, etc. At the National Cash Register Company's works, a room has been set apart for accumulative stock. If there is a pulley, bolt or any other piece of factory equipment not in use it is returned to this room where it is ticketed and listed. Now the purchasing agent buys nothing until the stock keeper is consulted.

Making the Men Punctual.

A simple check system is in use. A box is located in each department and the men drop their checks into the box in their particular deuartment. Bells in the different departments are controlled by the engineer. Automatically, as he rings the bells at seven and one o'clock, a simple electrical device closes the opening in the check box and the late comer must report to the foremen.

This means a saving as men are trained to be punctual. Supposing ten men in the factory, earning $2.00 per day, were five minutes late each working day, it would mean a loss to the company of $50 per year. If there were 20 men it would mean $100 per year; if the 20 men lost 10 minutes, the loss would be $200; if the men received $3 a day, it would be $267. Therefore in teaching the men to be prompt, savings have been effected in this way.

Indexing the Stock.

In order that the reader may appreciate the saving that may be made by a well-ordered stockroom is here shown. It was customary to have one or two men familiar with all the parts and depend on them for the delivery of stock to the various departments. As there are 13,000 parts kept in stock, the stores department was crippled if one of the workmen was ill or away for a day. It also hindered prompt deliveries on account of men not familiar with the work, having to handle the supplies.

A saving of 50 per cent. of the cost of maintenance has been effected in this way: A card bearing the number of the part and its name, is fastened to the front of each pocket in the bins. Then each row of pockets, and each bin is numbered 1, 2, 3, 4, etc. The parts are all listed alphabetically in a book for the purpose similar to the following:

1071 screw for cash drawer 3.16 in. x ⅜ in. bin 2, row 2.

It is therefore seen that an unitiated workman can easily locate stock and there are therefore no delays in obtaining material.

Piece Work in Erecting Shop.

Satisfactory results have been obtained by introducing the piece work system in the erecting shop and it is intended to introduce it into some of the other departments. When a job is given to a workman a job card is issued and this card must be presented to the foreman to show that the job is completed before he can obtain a new one. In this way the men are prevented from holding back work and entering it on the piece work card for the following day.

Dumb-waiter.

A dumb-waiter has been installed, which carries the work from the stock room on the second floor to the machine shop on the third floor and to the assembling room on the top floor. The time of a man is thus saved, for those employed in the stock room can send the boxes of small parts to the departments mentioned.

Obtaining the Men's Enthusiasm.

Mention has been made of the rest room. In addition their is a coat and wash room with rows of lockers, where the men keep their coats, towels, etc. The lockers were made by the company at a cost of about 90cts each. Wire screening is used for the front of the lockers.

Two towels and two aprons are supplied each workman per week. Every week, each is allowed to take a bath in the company's time, sprinkler baths being kept up by the company. The men are thus encouraged to be neat. Each man and foreman is made as responsible as is possible for the work under his charge. It makes them more enthusiastic and useful and they obtain higher wages.

Vol. VI. May, 1910 No. 5

CANADA'S GROWING TRADE.

Canada's total trade for the fiscal year ending last month reached the record figure of $677,142,189. This is an increase of no less than $117,506,238, or over twenty per cent., as compared with the preceding twelve months. It is an increase of over twenty-six millions as compared with the previous high record of 1907-8. At present the regular monthly increases over the corresponding months of last year are running over ten millions per month, and indications point to a total trade in the neighborhood of eight hundred millions for the current fiscal year.

The total imports for the year were $375,783,660, an increase of $77,659,868 over 1908-9. Exports of domestic products totalled $279,211,537, an increase of $36,607,951.

Exports of foreign products totalled $22,146,992, an increase of $3,238,419. The chief items of export for the year, with comparative figures are as follows:—

	1908-9.	1909-10.
Agriculture	$71,997,207	$90,433,747
Forest	39,667,387	47,517,033
Animals and their produce.	51,349,646	53,926,515
Mines	37,257,699	40,087,017
Manufactures	28,957,050	31,494,916
Fisheries	13,319,664	15,627,148

The total duty collected for the year amounted to $61,010,189, an increase of $12,269,175.

The total trade for March last was $66,561,208, an increase of $13,250,000. Imports for the month totalled $43,391,991, an increase of about $10,500,000. Exports of domestic products totalled $22,199,275, as compared with $18,397,971 in March of last year.

CO-OPERATIVE TECHNICAL EDUCATION.

In this issue of Canadian Machinery we publish a paper written by Robert Patterson, in which he advocates technical education for apprentices. He suggests that it be made possible for an apprentice, on completion of his term of practical training, to attend the university for a year, and combine theory and practice.

It is a poor rule that does not work both ways, and if the combination of theory and practice is good for an apprentice, it is also good for a student at the university. At some of our Canadian universities there are mechanical laboratories, where the students learn to run a lathe, use a drill, planer, etc., but it is the seven o'clock whistle, and the clink of the time check that makes a student know what his education is worth.

A young man in attendance at one of our universities spent his summers in one of the large locomotive shops. At the close of his second summer he went into the office to bid the master mechanic good-bye. It was a thoughtful time for him, and he thus addressed the head of the shops:

"I have spent two summers in the shops and any of the apprentices can take hold of a job and do it better than I can. Next spring I hope to get my degree; what am I then fitted for?"

That master mechanic had a great respect for that young man on account of his coming to the point of understanding. He realized, as all should, that when a man receives a salary or wages, the company makes an investment to the amount of the salary and wages, and the man must be in a position to give returns for that investment, which will justify the expenditure.

The student was recommended to spend another year or two in the shop and then, with both the theoretical and the practical knowledge combined, he would be prepared to take a more responsible position than he otherwise would.

Frederick W. Taylor, who presented that notable paper before the American Society of Mechanical Engineers, a short time ago, on "The Art of Cutting Metals," has taken an active interest in technical education, and he says:

"At college a very large amount of time is given up to the study of materials. Practically his whole chemical course is the study of materials. A very considerable part of his course in physics has to do with materials. The greater part of his work in a mechanical laboratory is a study of materials. Do you realize that the great raw material with which more than one-half of the successful graduates of our technical schools have to deal, receives not a single hour of study at our colleges and universities, not one hour? That the great raw material with which the managers, superintendents, presidents, every man of our large companies is dealing, is men? And these one-half of the students, who are finally called upon to manage workmen, learn nothing whatever about that at college. At twenty-two years of age on the average they land outside of college without the slightest knowledge of the great raw material with which more than one-half of them will have to work throughout their lives."

A joint committee appointed by seven of the English engineering societies, with three of the professors from universities, unanimously voted that it was desirable to

have two years' apprenticeship before students graduated as engineers. This is a very remarkable recommendation. It would, however, give the student a chance to understand shop conditions, and will show him that each one in an organization must become one in a train of gears. The combination of practical and theoretical will ensure success.

RAILROADS AS A TRADE BAROMETER.

For years the buying of the railroads has been looked upon as a trade barometer. At the present time large orders for freight equipment are being placed by the railroad corporations. Recently the C.P.R. placed an order for 1,000 steel freight cars, and within the past two weeks a second million-dollar order for 1,000 cars, all of which will be ready for the 1910 harvest. In addition to these orders, which have been pleced with an outside company, and which are being turned out at the rate of fifteen cars per day, the C.P.R. are building twenty-four cars per day, making a total output of nearly forty cars per day.

The G.T.R. is calling for tenders for well over $3,000,000 of freight equipment, much of which is being ordered in anticipation of the wheat business from the west next year. The prospective order includes two thousand five hundred steel-frame box cars of 100,000 pounds capacity, especially designed for wheat carrying, and of a type which is a radical departure for the road. Twenty of these cars in a train will carry a thousand tons of wheat, and they will be utilized next fall when the western harvest starts.

In addition, the G.T.R. is now advertising for tenders for 500 special automobile cars. These are steel-framed box-cars, with doors taking up almost their whole end, so that big touring cars can easily be run in or out. The Grand Trunk touches Detroit and other big auto manufacturing cities, and has found special equipment necessary for this trade.

It is preparations like this that convey confidence to those who want more than general opinion before they are satisfied as to a country's prospects. When men who have their pulse so truly on the situation, like those constituting the management of our great railroads, start such equipment provision there can be little room for doubt.

AIMS TO CURB COMBINES.

Hon. Mackenzie King, Minister of Labor, has introduced a bill in the Dominion Parliament, which aims to provide machinery for investigating charges that prices of commodities have been unduly enhanced by combines.

The bill, in brief, provides that where six or more persons are of opinion that a combine exists, and that prices have been enhanced or competition restricted by reason of such combines, to the detriment of consumers, they may make an application in writing to a High Court judge for an order directing an investigation into such alleged combine. If upon such hearing the judge is satisfied that there is reasonable ground for believing that a combine exists which is injurious to trade, or which has operated to the detriment of consumers, and that it is in the public interest that an investigation should be held, the judge shall direct an investigation. The Minister of Labor then chooses a board of three members to investigate the alleged combine, which if found guilty, is liable to a fine of $1,000 a day and costs for each day it offends after the expiration of ten days from the date of the publication of the board's report in the Canada Gazette.

The bill has been introduced late in the session and as it is an important measure, it is likely to be held over until next parliament before final adoption. Mr. King will have the sympathy of a large body of Canadian citizens in his endeavor to restrict the harmful influences of trusts and combines, while leaving trade associations free to continue their regulation of the minor details affecting their various industries.

The chief defect of the bill proposed seems to be the ease with which a handful of individuals could cause business enterprises a lot of trouble by compelling them to present books and other documents in court to disprove charges which may or may not have been laid by responsible persons. A discussion of the features of the bill is desirable and wise action would be taken in referring it to a committee of the House or allowing it to stand over until the next session of Parliament.

IRON MILLS TO MERGE.

The latest rumor in connection with the proposed merger of various iron and steel mills is that the Dominion Iron and Steel Co. are interested in the offer to purchase the Montreal Rolling Mills. This is incorrect, however.

The Dominion Iron and Steel Co. were mentioned in this connection some time ago but more recently the understanding has been that the merger would include the Hamilton Steel and Iron Co., the Canada Screw Co , the Canada Bolt and Nut Co. (with mills at Brantford, Toronto, Belleville and Gananoque), and the Montreal Rolling Mills. There has been trouble in securing the approval of the Hamilton Steel and Iron Co.'s shareholders, however, they holding out for $9,000,000 in stock in the new company, whereas they have only been offered $7,500,000 in merger stock for their $3,000,000 of Hamilton Steel and Iron stock. This seems to have upset arrangements as it is now said that the merger will be gone on with without any steel company being included, it being purely an iron mill consolidation.

That the proposition is progressing is evident from the fact that the directors of the Montreal Rolling Mills issued on Thursday of this week a circular to shareholders advising them to accept the private offer made of $300 per share for stock which has been quoted at $250. Replies are requested by June.

A considerable step forward was made when the Canada Bolt and Nut Co. consolidated half a dozen mills under one head, and if the Hamilton and Montreal mills join interests with the Canada Company, having headquarters in Toronto, the finished iron products industry will be in a strong position and capable of competing successfully with the large United States corporations.

If no steel mill is included in the iron merger, it is probable that the merger of Canadian steel industries, suggested some months ago, will be gone on with and the leading Canadian iron and steel industries consolidated under two heads working in alliance with each other.

ELIMINATION OF WASTE.

A question that is receiving the attention of manufacturers at the present time, probably more than ever before, is the saving of waste. In factories similar conditions exist as in locomotive repair shops, and in both these, as Mr. Smith points out in the article "Making an Annual Saving of Thousands of Dollars," great savings can often be made by eliminating the expensive handling of material. In the case in point, $8,000 was saved annually by the installation of a crane. The store room is often the source of a great deal of waste which may be

greatly reduced by storing material in bins, protecting it from atmospheric conditions, etc.

In this connection also a great responsibility rests on the purchasing agent. This is also pointed out by Mr Smith. Proper materials should be on hand when required and purchased when they are cheapest. The using of more expensive material than is required, because it is on hand and the specified material is not in the store department, is a source of waste which should be avoided.

A buyer for a manufacturing works often tries to have as little stock on hand as he possibly can. It costs money to carry stock, he says, and money brings in a large interest. It must also be remembered, however, that it costs money to wait for stock; it costs many times what the stock is worth to wait for it. In many cases it will be found that it pays to carry a large stock, especially of standard articles.

One way in which a saving can be made is to get the full efficiency from the machines at all times. The introduction of high speed steel has assisted us in doing this to a certain extent. The design of machine tools has had to advance to keep pace with the use of high speed steel and a great economy has been effected in largely increased production.

Another thing that works for economy is to have a well-balanced shop, that is, that production in the various departments must be balanced in such a manner, that the erecting shop has always a supply of material. This applies to all classes of factories. In the locomotive shop, the boiler, foundry and machine shops must work together to get the highest efficiency out of the shops. If the erecting shop cannot get cylinders from the foundries, or if they cannot get work from the machine shop, the department at fault should be strengthened to bring it up to the producing strength of the other shops.

The railroad shops of to-day are among the most progressive in securing economies and the manufacturers, generally, who look after the small items are placed in a better position to compete in the world's markets.

One reason for this is that the railroad official is ever ready to investigate anything which will result in further economies in the shops. A railroad repair shop is, as a rule, a model of economy. The machinery equipment is suited to the purpose for which it is intended and by the systems in use, stock is carefully accounted for, tools are taken care of and departments are in close touch with the master mechanic.

In the twentieth century development, however, new schemes are being devised which make it necessary for every manufacturer, master mechanic, superintendent and foreman to be on the alert. The reason for the growth and success of many industries is that the waste is taken care of and economies are introduced which has enabled them to make considerable profits. Some hard study is necessary to reduce the costs of manufacturing but the achievements of those who are eliminating waste, show that it is worth the investigation and work connected with it.

SECRET COMMISSIONS ACT.

His Lordship, Justice Magee says it is illegal for a purchaser to accept a secret rebate. The Secret Commissions Act makes no distinction between receiving and giving a secret commission.

Justice Magee says: "If you sent your servant to market to buy a horse and there he meets with a man who offers him a horse at $150 and says, 'If you will buy this horse at $150 I will give you $10 of it to yourself; and you need not have any compunction about it, because I would not let your master have it for less than $150.' And your servant gets it for $150 and puts the $10 in his pocket, you can recover that $10 from your servant. It is your money, not his, because it was made out of the transaction which he was carrying on with some person else for you; now, that is clear law. So, a commercial traveler sent out by a house here in Canada to buy goods for that house in the States, and he may be offered a commission by a person in respect to the goods he buys. When he comes back to Canada, if the transaction ever becomes known, he is liable to pay over that money to his employers. He has no right to be paid at both ends, unless it is known. This question of double commissions has for a long time past been quite too common, and has been permeating to a large extent the commercial life of the country. So much is that the case that last year the Dominion Government passed an act making it a criminal offence to take a double commission."

Let us see whether the other half of the act is not just as binding on the giver of the secret rebate as it is on the receiver. Clause (b) reads as follows: "Being an agent, corruptly gives or agrees to give or offers any gift or consideration to any agent as an inducement or reward or consideration to such agent for doing or forbearing to do, or for having after the passing of this Act done or forborne to do, any act relating to his principal's affairs or business, or for showing or forbearing to show favor or disfavor to any person with relation to his principal's affairs or business."

It must be evident from the above that the object of the law is to prevent the seller from giving a secret commission. So that the traveler who gives a secret rebate or other consideration is clearly violating the act.

So far as the liability of the person who accepts the secret rebate is concerned, clause (d) covers that. It reads: "Every person who is a party or knowingly privy to any offence under this act shall be guilty of such offence and shall be liable upon conviction to punishment hereinbefore provided for by this section."

So that an engineer or any other person who accepts a secret commission or consideration is guilty under the provisions of the act and liable to the penalties it imposes.

Canadian Machinery is pleased to know that its position has been so fully endorsed by such an eminent authority as Justice Magee. We are especially pleased because it tends toward honesty in business and it should, therefore, be hailed with pleasure by every honest person in Canada.

TO HELP CANADIAN ZINC INDUSTRY.

A bill introdoced by Hon. Wm. Templeman is now before the House of Commons at Ottawa authorizing the expenditure of $50,000 for investigating processes used in the production of zinc and for making experiments for the the promotion of the production and manufacture in Canada of zinc and zinc products from Canadian ores.

The bill has already been read a second time and been considered in committee, and it will likely be passed.

Some $2,500,000 was voted several years ago for a bounty on lead production, and of this $1,000,000 remains in the treasury. The present bill proposes to expend $50,000 of this balance on zinc experiments

There are no zinc smelters in Canada at present. One was started at Frank, Alta, some years ago, but the proposition was not a success. Lead and zinc are closely allied in the ores of British Columbia and to save the xinc, which at present goes to waste, the Government has consented to conduct experiments in Canada, the United States and in Europe.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

TURNING SEMI-CIRCULAR GROOVES.

By J. H. R., Hamilton.

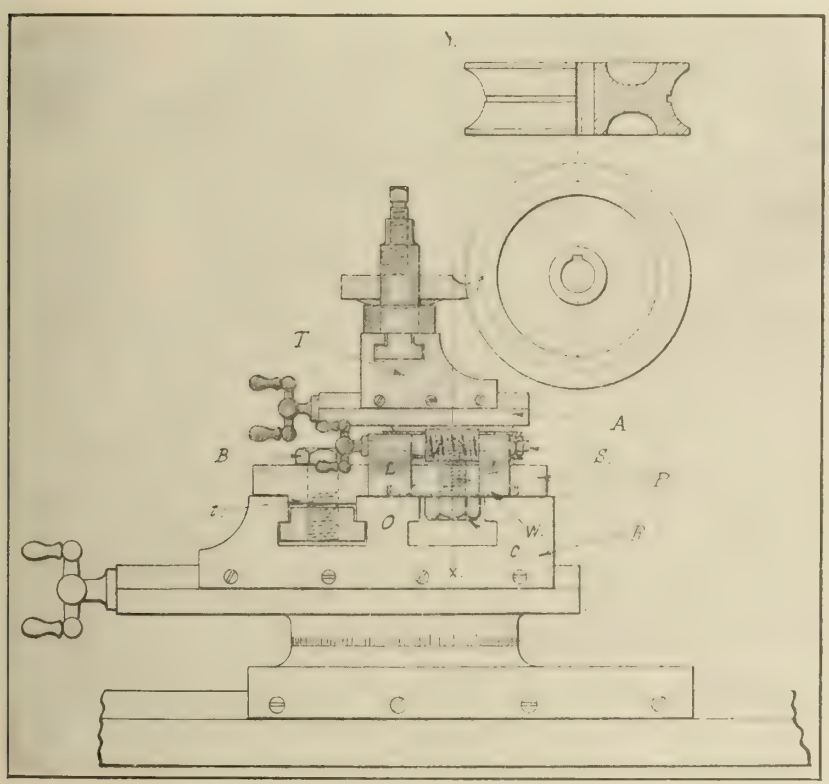
The accompanying cut shows a device for turning semi-circular grooves in small wheels as shown.

The device is practically a compound-rest with the addition of a worm and worm wheel for revolving the tool.

The piece P is bolted to the compound rest R by the bolt B, the tongue t fitting the slot in the rest R.

The worm wheel is secured to the extension on piece A which passes through piece P and held in position by the washer W and cap screw C.

On the side of the piece P are two lugs L L, which carry the shaft S on which is secured the worm O. The top slide T is for setting the tool when the centre of motion x y is in the desired position.

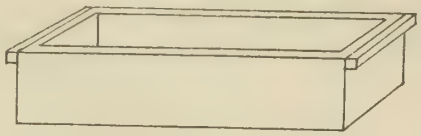


Turning Semi-Circular Grooves.

HANDLING SMALL PARTS ECONOMICALLY.

By K.. Campbell.

In a great number of shops, such as in agricultural works, there are a great number of small parts to be handled. There are malleable, grey iron and brass parts. As they come from the foundry they are sorted into bins; as the stock is required the pieces are taken to the machine shop. Here they are handled again by the driller, the lathe hand or the assembling man or all three.



Box for Handling Duplicate Parts.

For the handling of small part economically, the accompanying sketch shows one that has met with the approval of a number of factory managers. The size can be varied, but it is not advisable to make them too large. As a driller completes the operation on a piece, he can drop them into a second box. Then they can be passed along to the assembling room without the labor of picking them up off the floor before and after each machining operation.

WEIGHT OF SHEET ZINC.

By J. Staveley.

The accompanying table gives some useful information on the weights of sheet zinc. In the first column is "Zinc Gauge"; in the second, "Birmingham Wire Gauge"; third, weight per square foot in lbs. The last two columns give the weights of standard sheets 7 ft. x 3 ft. and 8 ft. x 3 ft., for various gauges.

FACTORY OR FOUNDRY SKYLIGHT

The skylight shown in the accompanying sketches has been designed to meet the demand for a cheap but absolutely strong and weather tight light and can be made advantageously in sizes up to 3x3 feet. It is of simple construction, and can be made complete in three hours by a competent mechanic. If it is necessary to use these lights in various sizes, sheet metal stub patterns should be made as shown in the drawings. The length of the bars is computed by the usual methods, except that as they do not come down on the glass rest of the curb; the common bars are cut ½-in., and the hip bars ¾-in. less than measurements.

The vent neck is made in one piece, as shown in the isometric drawing. In bending this sheet it should be creased along the lines G H before being form-

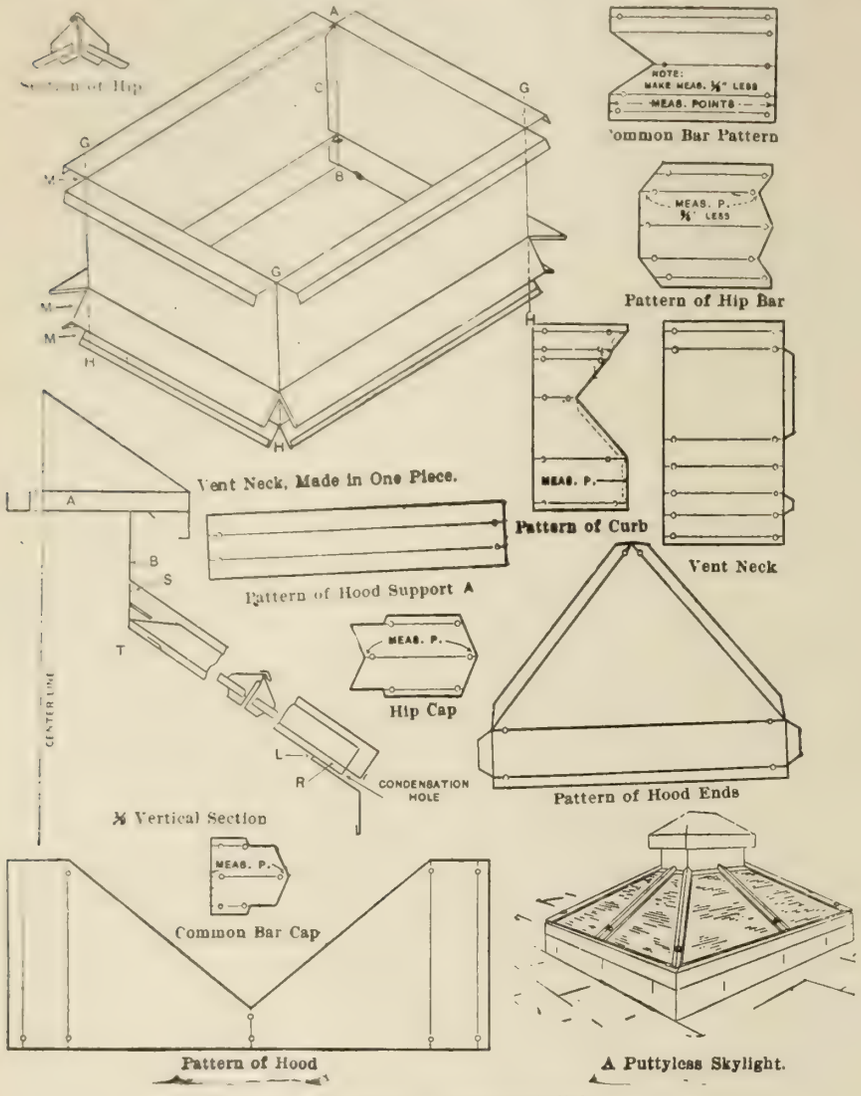
NOTICE TO SUBSCRIBERS

Subscribers will confer a favor on us by notifying us in case they are not receiving their paper regularly, or if they find they have missed one or more issues. We send out thousands of copies each month, and it is only natural to suppose that a few copies will go astray in the mails, even though every precaution is taken by us to avoid this.

We should also be notified at once of any change of address, giving both old and new addresses.

ed into the required shape. The corners should then be cut out at M. M. M. and the sides of the neck pulled around until the corner A B meets the solder lap at C.

To ensemble, the four sides of the curb should be soldered together and the ventilator completed. After the four common bars have have been soldered to the vent at T set them on the curb and tack at R. Next put in the hip bars and tack at R and S. The skylight should now be turned over and the bars soldered at L and the hips at T. It is then ready to be turned back and the glass laid on. Now put on the bar caps and solder to vent at S, thus completing the skylight.



Factory or Foundry Puttyless Skylight.

Screw Cutting on Engine Lathe Clearly Explained

Methods of Obtaining Different Trains of Gears Necessary to Cut the Various Threads are Given, Formulae being Illustrated with Examples.

By J. H. R., Hamilton.

Modern methods have to a great extent revolutionized this branch of the machine industry, and while this article will not appeal to the advanced class of machine operators, there will probably be some points which will prove of considerable value to a great number of the readers of this paper.

An operator on a lathe of modern make, with instantaneous change gears, simply has to read an index plate, move one or more levers and the lathe is ready to cut the thread.

But if an odd thread is to be cut which the modern lathe will not handle (or in a small jobbing shop), it must be cut in the engine lathe with the individual change gears.

The object of this article is to make clear the method of determining the different trains of gears necessary to cut the various threads. Fig. 1 shows a simple train of gears, while Fig. 2 shows a compound train. When cutting a certain number of threads per inch the ratio of speeds between the work and the lead screw must be determined.

If a lathe lead screw has a pitch of 1-6-inch, or six threads to the inch, and it is required to cut a thread of the same pitch, it is clear that the ratio will be 6:6 or 1:1; that is, the lead screw must make one revolution while the work is making one revolution.

But if the thread to be cut is 1-8-inch pitch, or 8 threads to the inch, the lead screw must only make six revolutions while the work makes eight revolutions.

Always remember that the number of revolutions of the work multiplied by the number of teeth in the driving gear must equal the revolutions of the lead screw multiplied by the number of teeth in the driven gear.

This applies also to the compound train. To find the gears necessary to cut the above by simple train.

Threads per inch on the work=8,

Threads per inch on lead screw=6.

If we have gears with 6 and 8 teeth we have to put the 6 on the work spindle, and the 8 on the lead screw; but as gears are seldom, if ever, made with less than 20 teeth for interchangeable gear on engine lathes we must find a pair of gears that will give us the desired ratio.

Select one of the smaller gears, say 24, and divide it by the threads per inch on the lead screw (6), which gives us 4, and then multiply by the number of threads to be cut (8), which gives us 32 for the gear on the lead screw, or multiply both numbers 6 and 8 by any number for the gears required, as:

$$\frac{6\times5}{8\times5}\quad\begin{matrix}30\text{ gear on spindle,}\\40\text{ gear on lead screw.}\end{matrix}$$

$$\frac{6\times6}{8\times6}\quad\begin{matrix}36\text{ gear on spindle,}\\48\text{ gear on lead screw.}\end{matrix}$$

$$\frac{6\times7}{8\times7}\quad\begin{matrix}42\text{ gear on spindle,}\\56\text{ gear on lead screw.}\end{matrix}$$

By General Formula.

$$W\times S=L\times D \text{ or } D=\frac{W\times S}{L}$$

where

W=threads per inch to be cut,

S=number of teeth in gear on spindle,

L=threads per inch on lead screw,

D=number of teeth in gear on lead screw.

Using in the above question

$$D=\frac{8\times24}{6}=32 \text{ teeth.}$$

Suppose we have to cut a screw $3\frac{1}{2}$ thread per inch on the above lathe. An easy way is to figure on a 2 inch basis instead of one inch, thus removing the fraction, this will give 7 threads on the work and 12 on the lead screw.

By formula

$$D=\frac{W\times S}{L}=\frac{7\times48}{12}=28 \text{ teeth.}$$

Select a gear for S that will be divisible by 12.

To cut a screw of $\frac{3}{8}$-inch pitch (that is, 8 threads in 3 inches) on a 4-thread lead screw.

Threads in 3 inches on work=8.

Threads in 3 inches on lead screw=4×3=12.

By formula

$$D=\frac{W\times S}{L}=\frac{8\times48}{12}=32 \text{ teeth.}$$

To prove whether your gears will cut the thread.

$$W\times S=L\times D \text{ or } \frac{W\times S}{L\times D}=0.$$

$$\frac{W\times S}{L\times D}=0=\frac{8\times48}{12\times32}=0.$$

To find gears to cut a screw of 5-32-inch pitch with a 5-thread lead screw.

Threads in 5 inches on work=32.

Threads in 5 inches on lead screw=5×5=25.

By formula, $D=\frac{W\times S}{L}$

Select a gear for S that is divisible by 25, thus—

$$D=\frac{32\times50}{25}=64 \text{ teeth.}$$

Proof—

$$\frac{W\times S}{D\times L}=\frac{32\times50}{25\times64}=0.$$

Suppose we have 24 threads to cut on a 6-thread lead screw. Smallest gear on lathe has 24 teeth. Largest gear on lathe has 80 teeth. Ratio of speeds=24:6=4:1.

By formula

$$D=\frac{W\times S}{L}=\frac{24\times24}{6}=96 \text{ gear required}$$

for simple train.

As we have no 96 gear we must use a compound train.

Divide 96 by 2=48 for gear on lead screw. For the intermediate gears A and B, Fig. 2, use any pair with a ratio of 2:1, as 80 and 40, 72 and 36, etc. Run the 24 into 80 and 40 into 48.

Proof of Correct Gearing.

$$\frac{\text{Threads on work}\times\text{driving gears}}{\text{Threads on lead screw}\times\text{driven gears}}=\frac{24\times24\times40}{6\times80\times48}=0$$

In the above problem the 96 could have been divided by any number, but whatever number is used as a divisor the ratio of the intermediate gears must correspond. Dividing by 3 the ratio of intermediate gears must be 3:1. Dividing by 4 the ratio is 4:1. Dividing by $2\frac{1}{2}$ the ratio is $2\frac{1}{2}$:1.

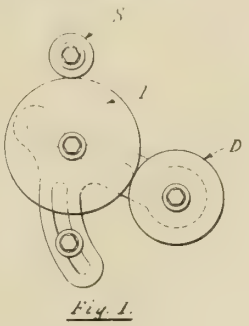


Fig. 1.

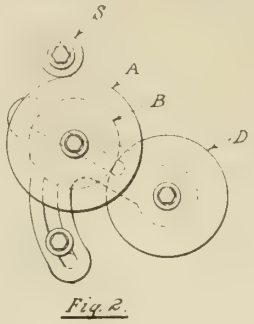

Fig. 2.

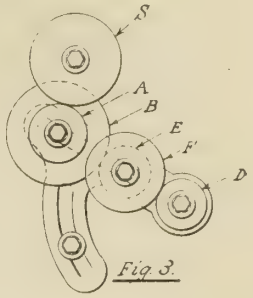

Fig. 3.

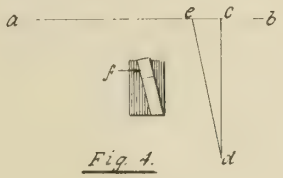

Fig. 4.

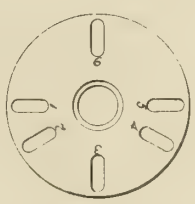

Fig. 5

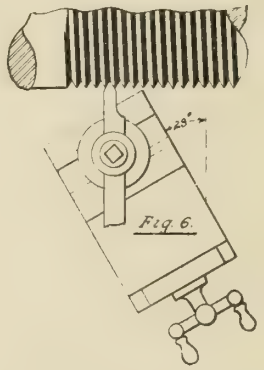

Fig. 6.

Screw Cutting in Engine Lathe.

To cut a thread of 1-28-inch pitch on a 5-thread lead screw.

Ratio—28:5.

By formula—

$$D=\frac{28\times20}{5}=112 \text{ gear on lead screw,}$$

for simple train.

Using 2 1-3 as a divisor,

$$112\div2\ 1\text{-}3=\frac{112}{1}\times\frac{3}{7}=48 \text{ gear for lead screw.}$$

Intermediate gear ratio=2 1-3:1=70:30

Proof of correct gearing—

$$\frac{28\times20\times30}{5\times70\times48}=0.$$

Sometimes a job will come along where one pair of intermediate gears will not solve the trouble, and another pair is necessary, as shown in Fig. 3. An instance in mind is several brass spirals which had a pitch of 1.625 inches, or 6 revolutions in $9\frac{3}{4}$ inches (to be cut on a lathe with a 4-thread lead screw).

To Determine a Train of Gear to Chase the Spiral.

Threads on work in $9\frac{3}{4}$ inches=6.

Threads on lead screw in $9\frac{3}{4}$ inches=$9\frac{3}{4}\times4=39$. Ratio 6:39=1:$6\frac{1}{2}$.

Converting the $6\frac{1}{2}$ into three factors (one single and two double factors) as

$$2(1\times2)(1\times\frac{5}{8}) \text{ which equals } 6\frac{1}{2}.$$

Select a gear for the lead screw, say 40, and solve for the rest.

Take the first factor (2) and multiply by 40, which gives 80 for gear on the spindle.

Ratio of first pair of intermediate gears, as shown by the second factor (1×2) is: 1:2=45:90.

Ratio of second pair, as shown by third factor ($1\times1\frac{5}{8}$), is: 1:$1\frac{5}{8}$=40×65.

Train of gears—80 into 45, 90 into 40, 65 into 40.

Proof of correct gearing, Fig. 3.

$$\frac{W\times S\times B\times F}{L\times D\times A\times E}=\frac{6\times80\times90\times65}{39\times40\times45\times40}=0$$

Grinding Cutting Tool.

In cutting threads, especially those of coarse pitch, care should be taken to have the tool ground to the proper angle.

To find the desired angle proceed as follows: On a piece of tin draw an indefinite straight line, ab, Fig. 4; from C drop a perpendicular, CD, making CD equal to the circumference of the work measured at the root of the thread. On ab lay off ce, equal to the pitch of the screw; connect ed, then aed is the angle of inclination. Give the forward side f of the tool a little more clearance than this angle.

When cutting square threads of single or multiple, a narrow-nosed tool is usually used for roughing, and finish with one the exact size.

Fig. 5 shows a handy face-plate when cutting double, triple or quadruple threads, the slots being placed equal distance around the face.

When cutting V-threads a good way is to swing the compound rest, making an angle of 28 or 29 degrees, as shown in Fig. 6, with the cross-feed and using the compound rest feed for making the cut, as the cutting is done with one side of the tool, the other side just scraping. This in many cases will prevent tearing the thread.

Correspondence

Readers are invited to send in replies to answers asked under "Correspondence," and these will be paid for at regular editorial rates. Anyone desiring the names of firms manufacturing certain lines will be answered under this heading. Comments on previous articles containing good ideas will be paid for.—Editor.

Wire Springs.

I would like the address of a company who can supply me with a machine for turning continuous wire springs.—N. S. Subscriber.

Canadian Fairbanks Co., Montreal, are agents for companies manufacturing automatic spring coilers. If any other dealers handle such a machine we will forward their literature to the inquirer at their request.—Editor.

Hardening Steel Gears.

In the current issue of "Canadian Machinery" a manufacturer asks for a practical method of hardening steel cut gears, but the information given is a little vague to be of value in determining the method that should be employed.

Steel is a very general term. A few years ago, the Cutlers Co., Sheffield, took proceedings against a firm of manufacturers who were turning out table blades made from common iron, to which a small quantity of mild steel punc ings had been added, and stamping them "Sheffield Steel."

In hardening steel, it is absolutely necessary to know the analysis of the material and just as necessary to have good practical appliances for uniformly heating and cooling the articles. The sketch given shows, I should judge, an article sufficiently expensive to justify a still further expenditure on a small hardening plant which would ensure a successful treatment.—F. W.

Power of Belts.

Do you know a good shop method for quickly calculating the power transmitted by belts? I would appreciate receiving same.—Tweed.

The following formulae give the horse-power which may be safely transmitted by belts:

$$\text{H.P. of single} = \frac{w \times t}{600}$$

$$\text{H.P. of double} = \frac{w \times t}{400}$$

where w=width of the belt in inches, and t=number of feet belt travels per minute. Thus a single belt 3 inches wide running 300 feet per minute, will transmit $3 \times 300 \div 600 = 1\frac{1}{2}$ horse-power. A double belt 8 inches wide running 800 feet per minute will transmit $8 \times 800 \div 400 = 16$ horse-power.—Editor.

Vulcanizing Rubber Tires.

In reply to "Mildmay," we would advise him to read "India Rubber and Its Manufacture," by Herbert L. Terry. This book may be secured at the following address: "Technical Books, 10 Front St. East, Toronto." Chapter IV. is devoted wholly to vulcanization and the various methods. They are also treated under the various products. In chapter XVII. India rubber tires are dealt with, thirteen pages being devoted to tires.—Editor.

TECHNICAL EDUCATION COMMISSION FOR TORONTO.

The following commission appointed as a result of a conference of the Y.M.C.A., and other bodies interested in the industrial needs of Toronto, will investigate the requirements of commercial and technical education in Toronto:

Wm. Pakenham, B.A., Dean of the Faculty of Education in the University of Toronto, chairman; R. H. Verity, general superintendent of the Massey-Harris Co., representing the Young Men's Christian Associations of Toronto; Frank Bancroft, a member of the educational committee of the Toronto District Labor Council; J. D. Allen, vice-president of the A. A. Allan Co., representing the Board of Trade; and Geo. A. Howell, of the Standard Paper Co., representing the Toronto Branch of the Canadian Manufacturers' Association.

The work of the Commission is as follows:

"The commission shall report upon the conditions and requirements of commercial and technical education, particularly of boys and young men, in the City of Toronto, and upon how those needs may be met. The commission shall also indicte how the Young Men's Christian Association may co-operate in providing for such educational needs." As the Toronto Y.M.C. Association are planning three new buildings, they have combined forces with other organizations in obtaining information to assist them in their educational courses, which will be carried on in their new buildings.

TECHNICAL EDUCATION COMMISSION.

Hon. W. L. McKenzie King has announced recently that a commission on technical education, consisting of probably five men, to have the widest powers of investigation, will be appointed by the Dominion Government. The commission will have authority to go to the United States, Britain, Germany and other European countries in search of information. They will then submit a worthy plan of technical education that may be taken up by the province. The Dominion will co-operate with the provinces as far as it can under the constitution.

BOUNTY ON WIRE RODS.

Hon. Mr. Fielding has given notice of the following resolution: "Resolved, that it is expedient to provide that no bounties shall be payable in respect to rolled round wire rods after June 30, 1911, under the provisions of the Act of 1907, respecting bounties on iron and steel, except on such rods as may have been otherwise entitled to the payment of bounties, and which were on or before the said date sold to wire manufacturers for use or used in making wire by the makers of such rods in their own factories in Canada."

D. J. Taylor, Regina, has been appointed manager of the Winnipeg branch of the Gould, Shapley & Muir Co., of Brantford, Ont.

CARE OF BELTS.

By J. H., Hamilton.

Leather belts being one of the greatest mediums for the transmission of power, the care and service of the belt and accessories should be one of the chief duties of the engineer, or man in charge.

Leather belts should always be run with the hair or grain-side next the pulley, as the strongest part of the belt is near the flesh side; the hair side being more brittle than the flesh side, the compression will come upon the inside of the belt when passing over the pulley. Wherever possible the driving portion of the belt should come upon the lower side, as the slack of the belt, caused by the extra tension of the drive will come on the upper portion of the belt, thereby giving more surface contact on the pulleys.

Where flanges are used to guide a belt, or in the case of cone pulleys, the face of the flange or cone should be undercut as shown at (a) Fig. 3, and kept clean. If dirt and grease are allowed to gather on the face, the belt will be inclined to climb the flange, and if it succeeds in climbing it usually means a broken belt.

I have noticed on several occasions where a stick was secured to the ceiling to keep a belt from coming off. This is a bad practice, as in time the edge of the belt becomes worn and rough. If a guide is necessary a roller should be placed in position instead of the stick, but a better way would be to remedy the cause of the trouble, which would likely prove to be a defective pulley, poor belt lacing or the shafting out of alignment.

Where belts run at a very high speed, care should be taken to have the pulleys run as true as possible. If the pulleys are not running true, the centre or crown is continually changing its position, and as the belt cannot follow this change fast enough, the belt will oscillate from side to side, especially if the belt is slack.

Belts may be fastened in several ways: By splicing and cementing making an endless belt; by lacing with leather lace and by the use of metal fasteners in many forms; leather lacing is the form most universally used, as it is flexible and runs smoothly over the pulleys.

Fig 1 shows a good way to lace a small belt, where one row of holes are used. First see that the belt is squarely cut so that both edges of the belt will be the same length. Punch the holes so that they are directly opposite each other.

Pass the lace through 1 from the under side then through 2, 3, 2, 3, 4 and 5, make a cut half way through the lace just clear of the hole 5, then about ¼" out cut off the lace. Proceed in the same manner for the other half.

For large belts a double row of holes are used as shown in Fig. 3; the width of belt will determine the number of holes. The order of lacing is through 1, 2, 3, 4, 5, 6, 7, 6, 7, 4, 5, 2, 3, x, y; secure at Y.

The two halves should be laced together as it helps to keep the belt in position.

Where it is necessary to enlarge the holes for the laces, one hole should be punched directly behind the other, not side by side, as the belt will nearly always break accross the lace holes, and as small a punch as possible should be used. Always have the straight part of the lacing on the hair or smooth side of the belt, so that they will come in contact with the pulley surface.

Where a belt has to be shifted from one pulley to another (especially on cone pulleys), metal fasteners should not be used, as it may prove dangerous to the hands of the operator.

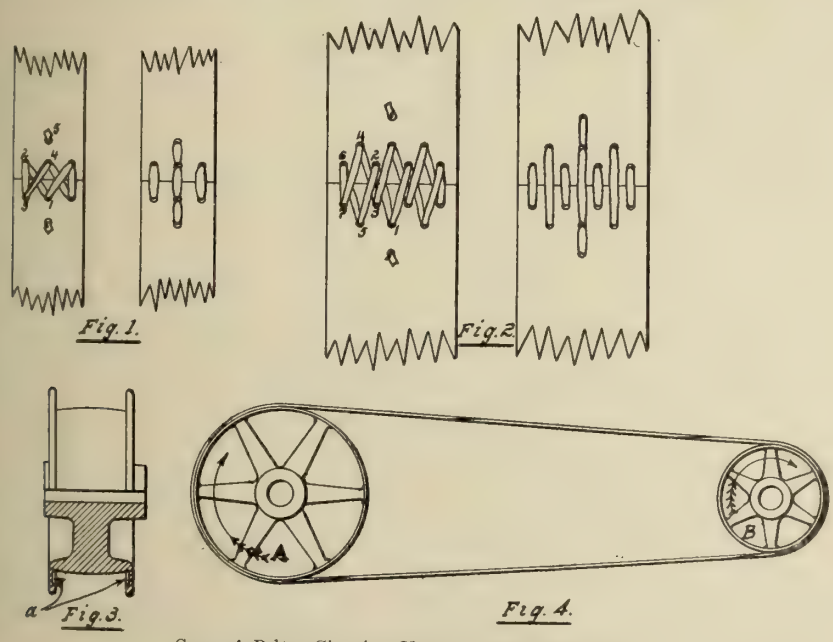
When a belt is placed on a pair of pulleys it should be put on as shown in Fig. 4, so that when the splice comes in contact with the pulleys it will help to keep the splice together.

In the majority of cases where slipping takes place it will nearly always be on the smaller pulley (where pulleys are of the same material), and it will be seen that by running the belt as in Fig 4 it will help to preserve the splice.

By covering the pulleys with leather or some material which will give a greater friction, more power can be derived, but the covering should be glued or cemented on.

While repairing a belt some time ago, I noticed that it was nearly cut in two the full length, one of the pulleys had been covered with leather, and secured with tacks and nails; a few of the nails had worked out, and the slipping caused by the irregular strains on the belt had nearly ruined it.

As the pulley was on the main shaft I suppose the man responsible thought the pulley could do its own "driving."



Care of Belts, Showing How to Lace them, etc.

COUNTERSHAFTS AND BELT DRESSINGS.

By L. Bailey.

Countershafts cut quite a figure in transmitting power to various machines and there is any number of clutch counters that are supposed to be far superior to the old tight and loose pulley class, and no doubt they are for slow

running machines, but for high speed such as is required for brass working tools there seems to be a want that has not been supplied up to date.

The writer has had considerable experience with countershafts with clutch pulleys on, of several different manufacturers, and I must say that I have not seen one that has been quite satisfactory. The difficulty seems to be that the lubricant throws off with the high speed and the counter being reversed quickly, cuts or grinds away the grip and the adjustment having to be made so often soon becomes exhausted.

There is also another defect, namely, the hub of the pulleys are too short on the side next to the clutch and the bore of the pulley soon wears taper and the belt will run on one side of the pulley so that when the clutch is thrown in, off goes the belt. Of course, a fellow don't mind that especially if the ladder is not handy, or Tom, Dick or Harry got the belt stick and forgot to bring it back. Well, perhaps some of my fellow mechanics have had better success than I, so I would like to hear from some of them on the subject.

A Belt Dressing.

It seems to me that this is something like patent medicines. We think that they are O.K. for a while, then something else comes along and so we keep trying new dressings. I have come to the conclusion that the castor oil treatment is best for the reason that when the so-called belt dressing is applied it is good for a while but soon wears off and another dose is needed.

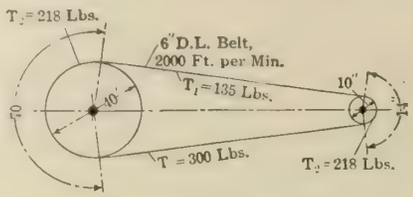
When castor oil is applied, it goes right through the leather and makes it very pliable and also prevents the belt from slipping on the pulley.

When putting on a new belt it is often difficult to keep it on because of the slick surface and the stiff leather. To get over this difficulty when your belt is cut to length lay it down and give it a coat of castor oil and when you have put it on the pulleys it will stay.

POWER LOSS OF A SLIPPING BELT.

One often sees discussed the question whether or not a slipping belt is less economical of power than one which does not slip. If we consider that when a belt slips friction occurs between the pulley and belt, thus creating heat, it is at once seen that part of the driving power is "lost," as the radiation of this heat attains no useful end. Writing to the American Machinist, A. L. Campbell writes that the approximate amount of this loss may be obtained as follows:

A motor delivers ten horse-power to a line shaft by means of a six-inch double leather belt running 2,000 ft. per minute. The accompanying sketch shows the belt tension T to be 300 pounds on the tight side, while the tension T, on the slack



Tensions on Belt.

side is 135 pounds. The average belt tension T_2 will then be about the half sum of the other two, or 218 pounds.

The tension in the walls of a thin cylinder due to a uniform pressure is equal to the product of the unit pressure multiplied by the radius of the cylinder. Conversely, since the average

---

BELT TROUBLES.

When I took charge of a small lighting plant last June, says G. B. Kamps in Power, I found a 60-kilowatt, 2200 volt alternator driven by a 9-inch belt. The belt was cut, apparently, from an 18-inch belt and consequently the centre of the old belt came at one edge of the new belt. My predecessor evidently had had trouble with the belt because he used a guide made of pipe fittings as shown in Fig. 1. The belt ran very close to the housing of the machine and would rub very hard at times; the guide only made matters worse and opened the belt on one side as shown.

The belt was running with the laps. I turned it inside out and ran it for a while until the belt was straight. I then glued and pegged the edge of the belt and put it on as it was before but could not keep it on. I ran it with the

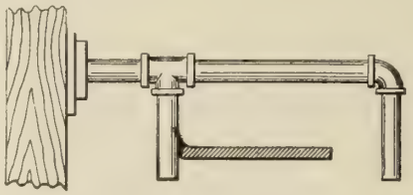


Fig. 1.—The Belt Guide.

laps, against the laps, right side out and inside out, but to no avail. As soon as the load would lighten, off came the belt. One night I was especially anxious to have the lights remain on when the load dropped off and knowing that powdered rosin or belt dressing was of no avail, I dug up an old mill file. When the belt started to "act up" I held the file down on the belt until the flying dirt and leather burned me. The belt stayed on with an occasional coaxing with the file.

I finally got over the trouble by cleaning the belt thoroughly and shifting the centre line of the alternator as shown in Fig. 2. The amount of shift must be very slight because the belt tends to crowd to the high side and work off if the angle is too great. I scraped the belt about once a week and applied a little neatsfoot oil after each scraping.

My pulleys are on 25-foot centres, the driving pulley is 5 feet 10 inches in diameter and the driven pulley is 14 inches in diameter, the belt speed 4,900 feet per minute.

My experience has been that the cleaner the belt is the less it will slip, and that powdered rosin and belt dressings should be avoided. A little neatsfoot oil applied occasionally will keep the leather soft and pliable and will work the dirt out of the leather.

I use the following approximate formula: A single belt under a working strain of 60 pounds per inch of width, running 550 feet per minute, will transmit one horsepower for every inch of

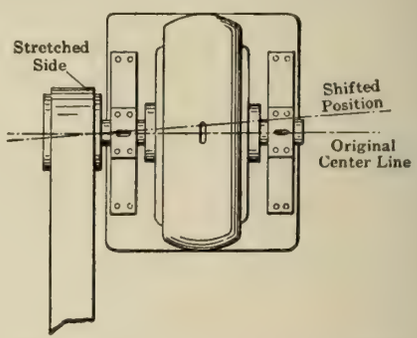

Fig. 2.—Centre Line of Alternator Shifted.

width. The pull, in pounds per inch of width, equals,

$$\frac{\text{H.P.} \times 33{,}000 \times \text{width of belt}}{\text{Belt speed in ft. per min.}}$$

For dynamo work, the pull or load per inch of width in single belts should not exceed 40 pounds under a speed of 4,000 feet per minute nor 32 pounds under speeds from 4,000 to 6,000 feet.

DON'T IGNORE SMALL THINGS.

Real economy is as important in small things as in great, but it is more likely to be neglected. People who are obliged to use a large amount of rope are compelled to study the rope market, and soon learn that it pays to buy the best and let the cheap stuff alone. This is likely to be overlooked by the small user because the amount involved is comparatively small, but it is a mistake to ignore the question. The reasons why a good rope is really cheaper than a poor one are just as true for the farmer who buys a piece of rope for his hay carrier as for the ship owner who buys it by the ton.

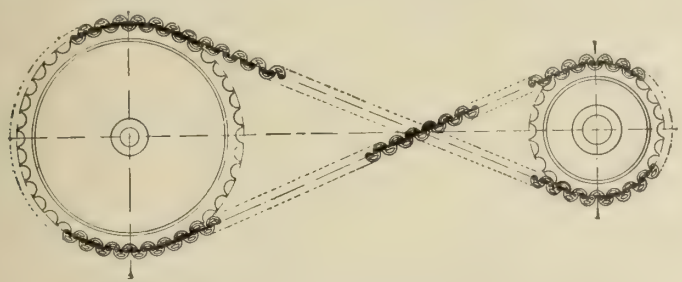
DEVELOPMENTS IN MACHINERY

New Machinery for Machine Shop, Foundry, Pattern Shop, Planing Mill; New Engines, Boilers, Electrical Machinery, Transmission Devices.

REVERSIBLE CHAIN DRIVES.

One of the disadvantages, if it may be termed as such, of chain driving happens when it is sometimes necessary to run the chain crossed, so as to give the driven an opposite rotation to the driver. Until recently this has been an impossibility, and the Coventry Chain Co., Coventry, England, have just put on the market a noiseless chain which can be crossed at centres over seven feet.

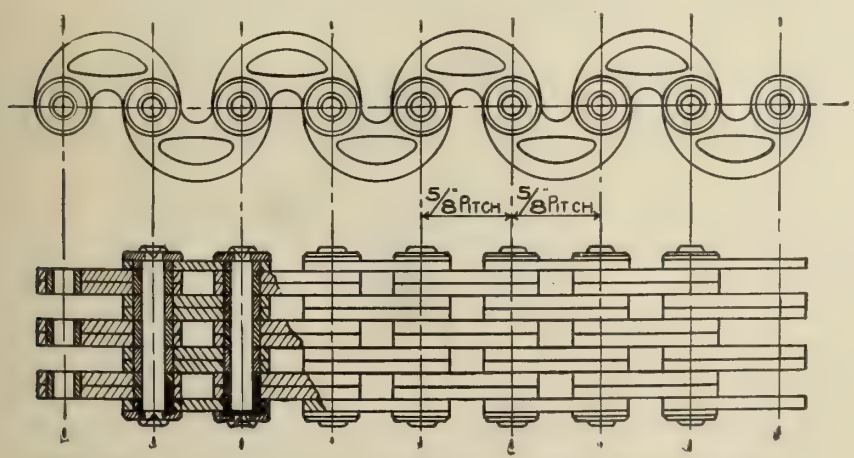
As shown by the detail cut the chain is perfectly symmetrical and it matters not which side is in contact with the toothed wheel. It will also be noticed that the chain has been lightened considerably by cutting out pieces of every link. This feature of lightness, combined with durability, will no doubt be interesting to the designer of flying machines as also will the fact that it can



Reversible Chain Drive, John Milne & Son, Montreal.

be crossed and do its work at the high speed of 2,500 revolutions.

This is a new chain on the Canadian market and is being distributed by John



Construction of Chain for Power Transmission, John Milne & Son, Montreal.

Millen & Son, Limited, Montreal, along with their other lines of Coventry chains.

POWERFUL BENDING MACHINES.

The Watson-Stillman Co., of New York, has just introduced two new powerful hydraulic bending machines, which should prove of interest to all who have large pipe, structural sections, automobile parts, metal bars and similar sections to bend.

The frames and cylinders of these machines are cast iron and the cylinders are copper lined. The rams and bending pins are machinery steel. A positive stop is provided in both instances to prevent the ram from passing out beyond a safe limit.

The smaller machine shown in Fig. 1, is capable of exerting a power of 25 tons under a hydraulic operating pressure of 2,200 lbs. per square inch. The table is two feet long by 3 feet 4 inches wide and is provided with 18 round holes staggered in rows which are symmetrically placed with respect to the ram. Round pins each 3½ inches in diameter can be placed in any of the holes and the work may further be held to place by bolts set in any of the key slots on the top and sides of the table. Modifications of this table top are made where necessary to conform to some special use.

The ram has a travel of 8 inches and is brought back to the beginning of the stroke by a counterweight. The centre line of the cylinder is 2¼ inches above the table, but this machine can be made with the bending block higher above the table or by making the ram travel in guides, the centre line may be below the table. The cylinder head is removable

Fig. 1. Hydraulic Bending Machine, Watson-Stillman Co.

and provided with air passages for removing entrained air or draining if desired in cold weather.

Operation of the ram is controlled by a stop and release valve at the side of the cylinder.

The second bender, Fig. 2, is considerably larger and capable of exerting 30 tons pressure. In this instance the table is 4 feet wide by 6 feet long and has two opposed 7-inch cylinders of 12 inch stroke arranged to operate in either direction, the double headed ram extending between them.

The table as shown has 21 holes on each side of the ram and staggered in six rows. The movable pins are interchangeable and 4½ inches in diameter. The larger or bending pin shown in the centre is attached to a saddle on the ram. The ram works in machined guides and is covered to prevent scale or dirt from reaching the contact surfaces. These surfaces are further protected from dirt by plugging the oil holes in the cover with screw plugs.

As in the smaller press the cylinder heads are removable and provided with air passages which also permit drainage. The valves are placed in one body and may be operated by any of the four levers at the corners of the press. The arrangement is automatic so that opening of pressure or release valves for one cylinder opens the opposite valve of the other cylinder, the movement being stopped by removing the hand from the lever.

A pair of bending blocks faced with a hard steel may be substituted for the bending pin. The cylinders are cast higher up for uses where it is desirable to obtain greater power. In this instance the rams are usually made independent and single acting and are returned by counterweights similar to that shown on the small machine.

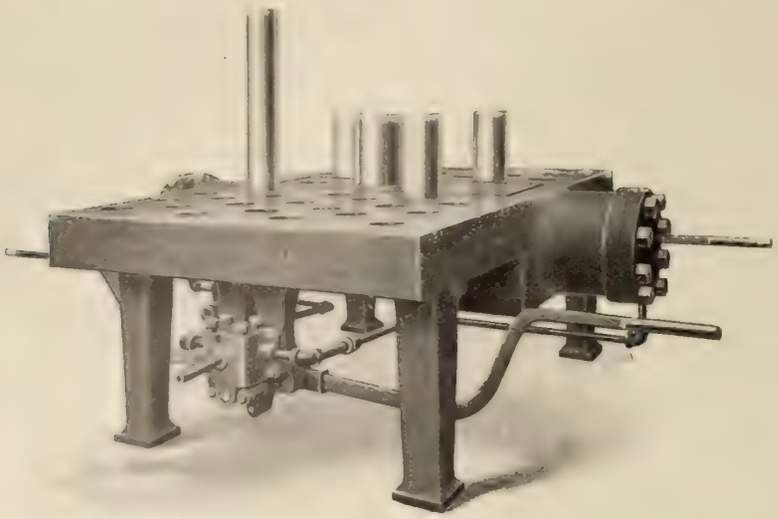


Fig. 2.—Large Hydraulic Bending Machine, Watson-Stillman Co.

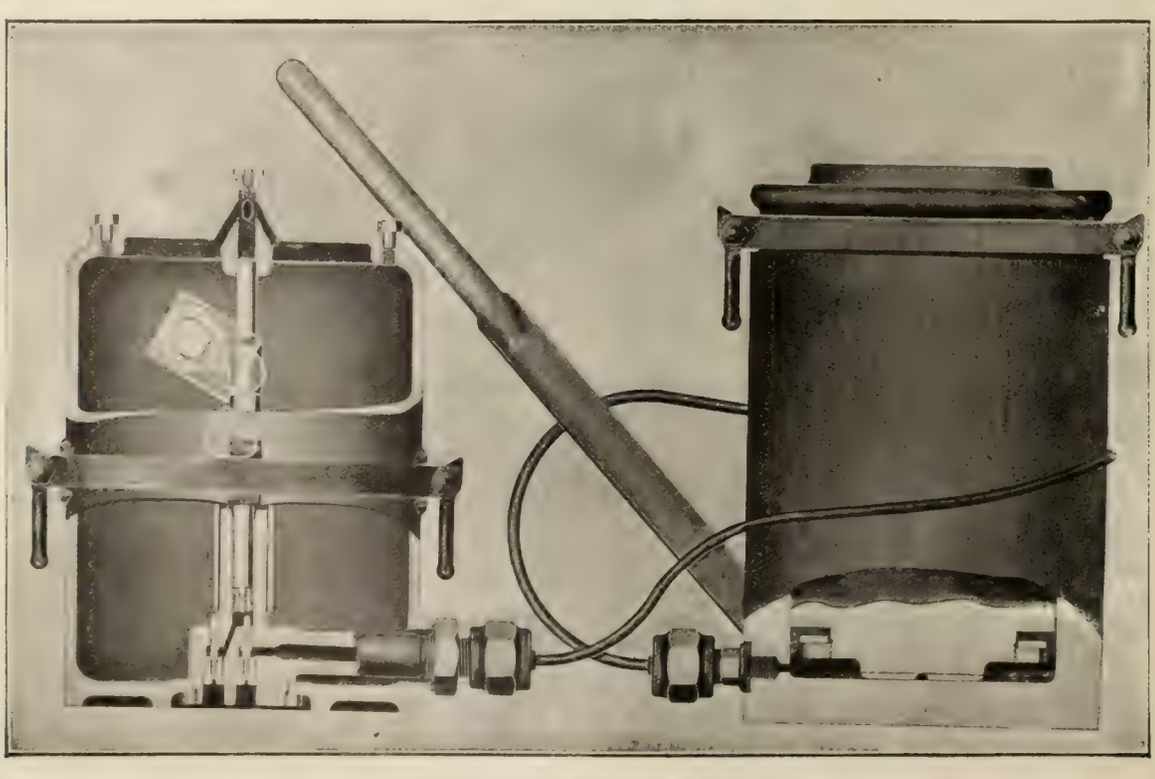
DUFF-BETHLEHEM HYDRAULIC JACK.

Something new in hydraulic lifting jacks is to be found in a design recently put upon the market by The Duff Manufacturing Co., Pittsburg, Pa. This jack is a powerful tool with lifting capacities ranging from 100 to 500 tons and a raise of from 6 to 12 inches. It is intended for use wherever it is inconvenient to operate an ordinary jack owing to lack of room, and is therefore coming into quite general use in shipbuilding, bridge construction, machine shops, etc.

The novel construction of this jack is clearly shown in the illustration. Forged steel is used throughout and the design is simple and compact. It consists of two main parts, the water reservoir with its pump chambers and the ram or lifting mechanism. These two parts are separate and distinct except for the flexible copper tubing which connects them. This arrangement allows the ram to be placed in any spot where there is sufficient room for it to rest securely, while the pump can be placed anywhere or at any distance permitted by the length of the tube, where it can be conveniently operated. Since the jack can be placed at any angle it is of great service in boiler work. With small modifications in the frame construction this tool can be put to many uses for which an hydraulic press is employed.

The details of the construction of this jack present many valuable and interesting mechanical features. On the left in the illustration is the pump and reservoir cross sectioned, in part, to show the valve construction. The pump is double acting with a working or pumping stroke on both upward and downward motion of the piston. There are two pump chambers the upper having about five times the capacity of the lower. The valves in the pump chambers are so arranged that on light loads the larger volume of water in the upper chamber is forced under the bottom of the same, causing it to rise through larger units of space than on heavy loads or overloads, when the smaller volume of water in the lower chamber is utilized. This speed adjustment is secured by means of an automatic bypass valve in the diaphragm between the upper and lower reservoirs which acts against a spring, which can be adjusted so as to allow the water in the upper pump chamber to escape at predetermined loads. This setting is generally at 25 p.c. of total capacity of jack, which corresponds to the lifting power which can be exerted by one man on large pump chamber.

To trip the load the operating lever is reversed so that the lug on the side projects upward allowing the lever to be pressed further down, causing the trip sleeve and pump piston to bear directly on the suction and discharge valves respectively, thus allowing the



Duff-Bethlehem Hydraulic Jack.

liquid to pass back from the ram cylinder to the reservoir. The load may be lowered as slowly as desired or stopped at will by varying the pressure or lifting up on the lever.

Since the weight lifted by the jack is inversely proportional to the speed of ram travel the arrangement just described automatically adjusts the speed to the varying conditions of usage. The valve action is positive and there are no refinements of construction to cause trouble in a tool that is sure to receive rough usage.

The tube which loads from the pump to the ram cylinder is, as already stated, made of flexible copper and is guaranteed by the manufacturers to withstand a pressure of 10,000 lbs. per square inch. This tube is about eight feet long.

In the construction of the cylinder there are several features which make for efficiency and economy of maintenance. This cylinder is a solid steel forging there being no joint at its base as in other makes. This design gives greater stiffness and strength with minimum weight and, what is more important, obviates the necessity of having a packed joint at the body of the cylinder. This joint is a fruitful source of leakage and is the hardest joint to make water-tight since it is the one subjected to the greatest pressure. This pressure varies, of course, directly with the load and with the distance through which the load is lifted, being greatest when the load is at rest at the extreme limit of travel of the ram. The only packed joint in this type of jack is between the ram and cylinder walls, where packing is easy and leakage less likely to occur owing to pressure being less direct and decreasing as the ram rises, being considerable when the load is at rest at the end of the lift. The valve and cylinder construction in the independent pump jack is not, however, peculiar to it but is characteristic of all the hydraulic jacks made by The Duff Manufacturing Co.

Developments in Grinding Equipment and Machines

The Landis Tool Co., Waynesboro, Pa., have recently Placed on the Market New Cam Grinding Attachments and a New Self-contained Grinding Machine, designed on Original Lines.

The Landis Tool Co. have brought out recently some new grinding attachments of interesting design. Figs. 1 and 2 show a cam grinding attachment for detachable cams which has been designed for use on the company's regular universal and plain grinders. The application to the machine is made by simply clamping the attachment to the table and connecting the driving arm on the end of the spindle with the regular driver on the face plate of the grinder, as is clearly illustrated by both views. It is constructed so as to swing, the spindle head being suspended from a hinge bearing directly above; the work and master cam are mounted on the same spindle.

An important feature of this attachment is that it grinds its own masters, which are copied from actual size model cams of the work to be ground. In making the master cam it is mounted on the working end of the spindle, while the model cam serves as a master on the other end; this operation is exactly the same as illustrated for grinding the work. This method insures the making of an exact copy of the form of the model cam, consequently a perfect duplicate of the work is obtained. The master is enlarged and the cylindrical portion is never less than 3 in. in diameter; this, in the majority of cases, makes the size more than double that of the work. The swinging or oscillating motion of the spindle is produced by the master working in engagement with a stationary guide, or shoe plate, with which it is held in contact by a spring. With the wheel and work in the corresponding relative positions at the other end of the spindle, it is evident that an exact reproduction of the model cam will result.

The slight change in the cam form caused by the reduction of the wheel by wear is compensated for by a set of change master cam shoe plates, which form part of the regular equipment furnished with the attachment. The contact or working surfaces of these is made of a regular curve form, with a consecutive difference of 1 in. in radius, which corresponds with the size of the grinding wheel at the different diameters as it is reduced by wear. The number of plates in a set is determined by the size of the machine on which the attachment is to be used—that is, by the diameter of the grinding wheel at full size and the smallest diameter to which it can be used. There is provided a change of plate for each inch of wheel reduction. In grinding the master cam a shoe plate and wheel of equal radius are used, which it will be seen must produce an exact copy of the model cam form; then placing the master in its proper position on the other end of the spindle, replacing the model cam and using the same grinding wheel and shoe plate or any other size of wheel and plate of equal radius, it will be seen again that an exact reproduction of the model or work will result.

As the wheel wears down the tendency is for the cams to become slightly full, which is practically imperceptible for 1-in. wheel reduction. The master shoe plates are so arranged as to distribute or evenly divide this variation. In this connection it must be noted that in making the master cam by using a wheel and shoe plate of equal radius the work will be reproduced precisely. For example, beginning with a full size wheel of, say, 14 in. diameter or 7 in. radius; with this a shoe plate on a

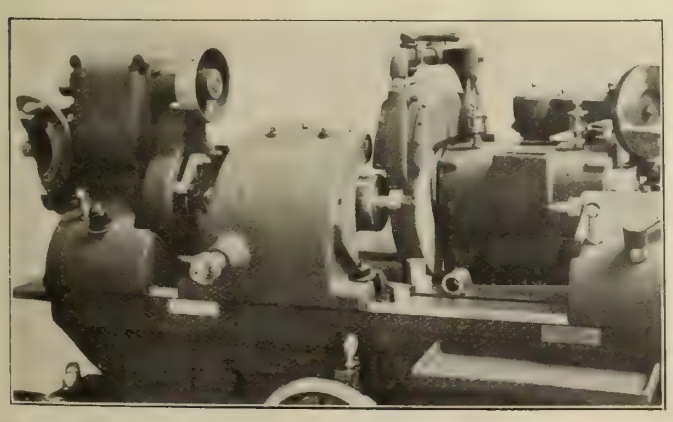


Fig. 1.—Working Side of a Landis Grinder With New Cam Grinding Attachment.

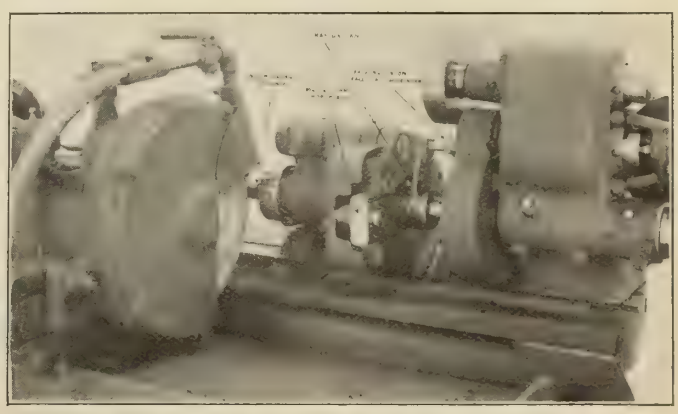

Fig. 2.—Rear View Showing Master Cam and Shoe Plate.

6¾-in. radius would be used; wearing the wheel down to 13 in. in diameter or 6½ in. radius makes it ¼ in. less than the shoe plate, and this difference being equal to the amount that the wheel was larger than the shoe plate in the beginning, it will be clear that the slight variations of the cam will be divided equally by a true line of the cam form. When the grinding wheel has been worn to 13 in. in diameter, the shoe plate is changed for one made

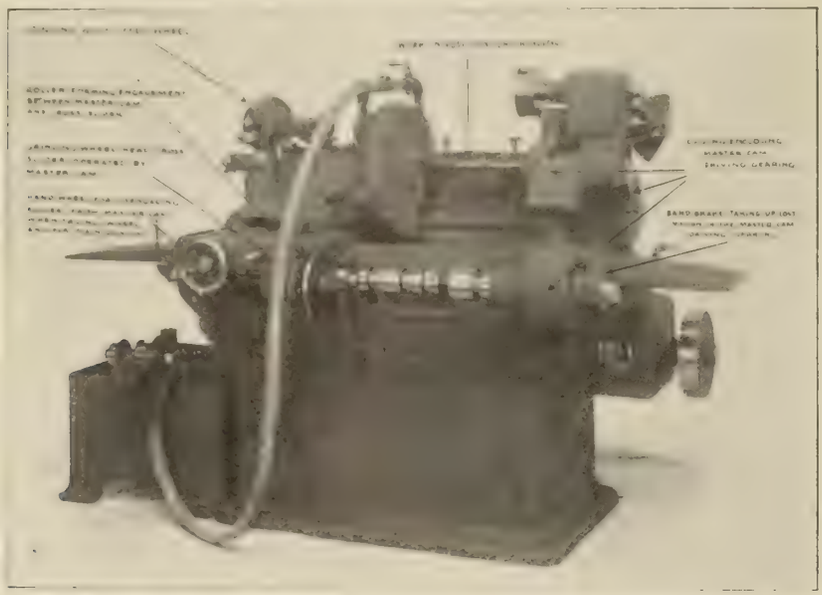

Fig. 3.—Special Landis Cylindrical Grinder Arranged for Grinding Cams Integral With the Shaft

on a 6¼ in. radius; at 11 in. in diameter, 5¼-in. plate, etc., and these changes continued until the wheel is reduced to its minimum diameter.

Cam Grinding Machine.

Fig. 3 shows the principal view of the Landis cam grinding machine which has been designed especially for grinding cams made integral with their shaft, but will handle detachable cams with equal facility. In arranging it for the loose cam work in the majority of cases the master cam is so made that a full set of either the inlet or exhaust cams can be placed on an arbor and ground at one setting.

This machine is substantially the regular 10 x 30 in. plain grinder with the cam grinding fixture applied. A master or former cam is placed at the rear of the machine and is rigidly supported by bearings bolted to the back of the main column or bed, and is driven in unison with the work by gearing from the headstock.

In this machine, instead of swinging the work from or toward the wheel to produce the cam form, the grinding wheel head is moved by a cross reciprocating motion actuated by the master cam and the work is carried by the regular stationary centres of the machine.

A separate master must be made for each style of cam shaft, which is copied from a model of the work by the machine itself. In the operation of producing the master the model shaft takes the place intended for the master on the machine and is supported rigidly between the cams its entire length, to avoid any possibility of its yielding or springing during the grinding operation of the master. The master cams are ground with their shaft between centres in exactly the same manner as the work itself is held. It will be evident that by using a perfect model of the work to copy from exact duplicates of the cam forms are obtained on the master. The body of the master is large in diameter, and for most work the cams are more than double the size to be ground. A portion of the body of the master remains between the cams in the form of a collar. When the grinding wheel is traversed along the work in passing from one cam to the next the roller on the rear of the slide mounts these collars and while in engagement grinding wheel is withdrawn clear of the work and no cross motion is given to the slider. When the wheel has been moved to the next cam to be ground the roller passes beyond the collar of the master and engages the corresponding master cam.

The reciprocating cross motion of the grinding wheel only takes place when it is moved to the cam to be ground. It will be seen that the grinding wheel can be traversed along the work automatically just the same as in grinding a plain piece.

The cam grinding fixture in no way interferes with plain straight grinding, and the machine can be used for grinding the line bearings of the cam shafts to the same advantage as if this part of the work were done on a regular plain grinder.

Fig. 4.—Front View Landis Grinder.

Self-Contained Grinding Machine.

The last four illustrations show another new grinding machine designed on original lines and built by the Landis Tool Co., Waynesboro, Pa. This is a 16x72 heavy duty self-contained grinding machine.

Throughout the entire machine it is of the high power and heavy duty construction and while intended for finishing all classes of work within its range it is especially adapted for grinding chilled rolls. The regular practice in grinding this work for grinding the body, is to support the roll by its journals on bearings mounted on the table of the machine. Previous to this operation the journals or necks are themselves ground, which is done with the roll carried on centres in the same manner as for regular plain grinding. The grinding wheel is 24 inches in diameter and the guard is made to take these with faces up to 4 inches wide. The wheel can be used at full size in diameter for grinding 16-inch rolls, which occupies the full swing of the machine. To compensate for any slight error in the alignment of the headstock and roll axes and to avoid any tendency of the drive to influence the roll from its true axial position, with the bearings, an equalizing fixture is attached to the face of the headstock which drives the roll with equal force from opposite points across the centre. In roll work it is well known the importance of the roll face being true and concentric with the journals; to be assured of this

when finishing on the grinder the above described method has been found to be the only practical and reliable one. Another feature contributing greatly to the making of accurate work is, the stationary work table which is supported its entire length by the main column of the machine.

The bearings for supporting the rolls when grinding the bodies and the equalizing driving fixtures are not shown by any of the illustrations, but become regular parts of the equipment when the grinder is furnished for roll work.

Useful for Railroad Work.

This machine is also adapted for railroad shop work for grinding locomotive pistons, piston valves, valve stems, crank, link and knuckle pins, axles, etc. It is provided with a gap, as shown by Fig. 6, so that pistons can be ground with their heads in place and also for the swing of valve yokes when grinding the stems. The gap can be located along the table to suit the work when the machine is built. The machine is of the self-contained type and is designed to be driven either by a motor or from the line shaft.

Fig. 7 shows the arrangement of the electric drive as well as showing an end view of the machine when provided with a gap for locomotive work.

With either form of drive the power is applied to the main shaft at the rear of the machine from which it is distributed and transmitted to all of the different working parts. The grinding wheel is driven from the large pulley seen in the rear view, Fig. 5, located at about the centre of the machine, which is mounted in a carriage rolling on the track shown extending from the base of the machine and travels with the wheel carriage as it is traversed.

This pulley is driven by step grooves on the main shaft engaging rollers in its sleeve or hub which makes practically a frictionless drive as it is traversed or slides over the shaft.

The grinding wheel belt is 6 inches wide and passes over intermediate pulleys so arranged to automatically take up any change in its length and at the same time keep it under a uniform tension.

This belt is almost 200 degrees contact on both the driving and driven pulleys and its length can change about 8 inches by stretching before necessary to remove a section and shorten.

The grinding wheel head is massive and rigid which is a feature so essential to rapid and perfect grinding. The spindle is of very large dimensions and is made of hardened steel; the bearings are of phosphor bronze, are self-aligning, are adjusted in tapers for taking up wear and have self-oilers. A very important feature of this wheel head is that the bearings are protected

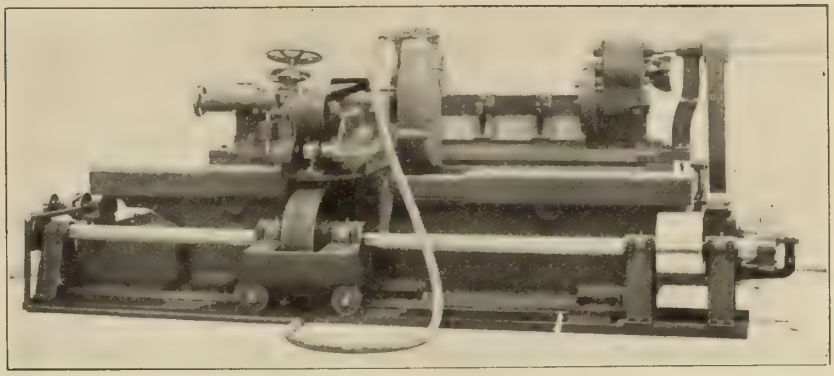

Fig. 5.—Rear View Landis Grinder.

by special covers and are positively dirt proof. The grinding wheel has provision for balancing, this being done by two weights mounted to be adjusted in a circular or annular groove in the side of the wheel collar or centre.

The headstock is very powerfully geared and has ample power for driving the largest piece of work or roll that can be placed in the machine. It is arranged to give five changes of speed to the work, these being made mechanically by the movement of a single lever, and by shifting a back gear in the gear box at the end of the machine seen in view Fig. 7, another range of five speeds is obtained, making a total of ten work speeds. These speeds are indicated on a dial as will be seen by Fig. 1 and the changes can be made quickly and with ease. All parts of the clutch mechanism are made of hardened tool steel and all gears are finished by planing.

The work revolving and traversing mechanism are driven from the gear box at the end to which power is delivered by the belt from the main shaft as is also shown by Fig. 7.

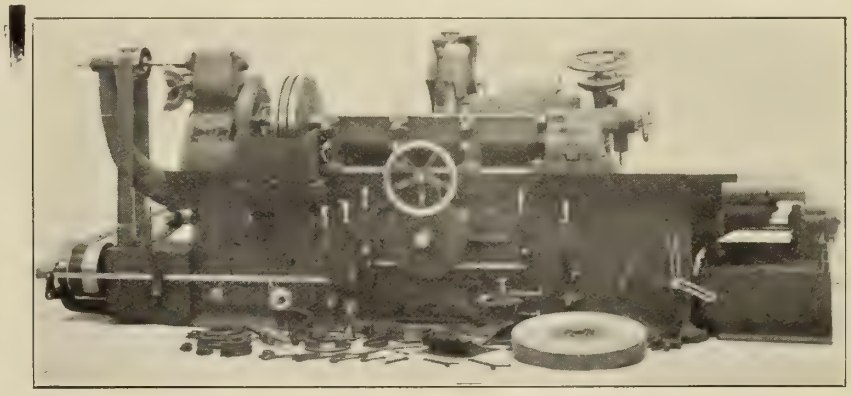

Fig. 6.—Landis Grinding Machine With Gap, Front View.

The work and traverse drives of the wheel are started and stopped together by a clutch in the pulley on the end of the gear box which is operated by a lever at the front of the machine. These drives can also be operated separately and their speeds are varied entirely independent of each other. The pump is driven from the end of the main shaft as will be seen in views Fig. 1 and 5.

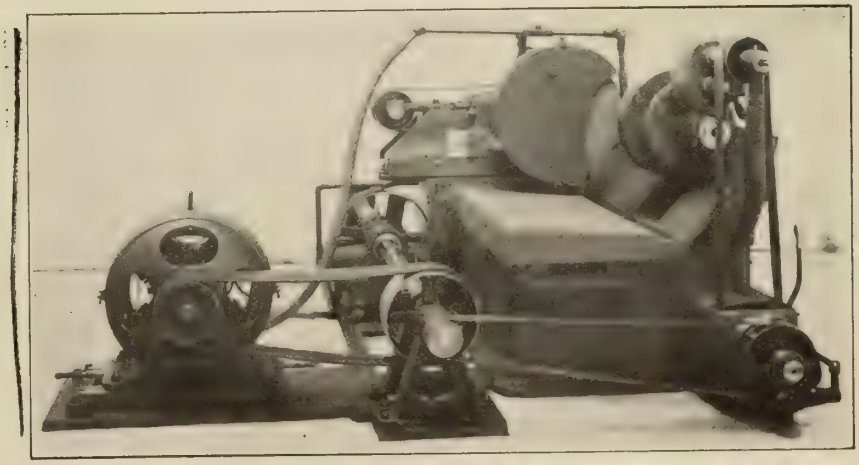

Fig. 7.—End View Landis Grinder, Motor Drive.

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

A. F. A. CONVENTION AT DETROIT.

The Detroit Convention, June 6 to 10, promises to eclipse all previous conventions. At a meeting of the Detroit Foundrymen's Association, held April 21, a general review of arrangements were given by the heads of the committee. Discussing the general preparations Dr. Stephenson said:

"In a general way I would say that, without any undue egotism on the part of our local organization, we can say that never in the history of the American Foundrymen's Association has the convention detail been so well covered as it is at the present time; this is the opinion of all those who are in touch with the situation, as it has developed, in the previous conventions. I find that statement reiterated in the letters which come to me, and in my associations with men identified with the foundry interests throughout the country.

"The badge matter will be handled to the satisfaction of the local committee. The State Far ground matter has been pretty well taken care of. All present booths will be taken out of the Administration Building. Mr. Hoyt tells me that the demands for space are far greater than has ever before been made, and he is figuring on the advisability, the last time I saw him, of using a tent.

"We have about decided to have the General Registration Headquarters and the reading of the papers to take place in the Michigan Building. The temporary building is not fully decided upon, but if the fair organization pulls out the present administration quarters in the main building, that will probably give Mr. Hoyt room to erect a smaller temporary building."

Plant Visitation.

It has been arranged that every plant will take care of every delegation which visits the various plants and show them around. The idea is to have the headquarters of the Visitation Committee at the Fair Ground and also at the Pontchartrain Hotel. Anyone who wishes to visit any of the plants in the city or any group will simply go to the Plant Visitation Committee, to whoever is in charge and so state, that they wish to visit such and such a plant. A card will be issued to them or to the leader stating that Mr. Blank with a dozen or 15 others will visit the plant and be shown through.

Information for Members.

The information that will be given to every member will be something like this: A folder in the middle of which will be a map of the City of Detroit, a complete map showing the car lines, the location of the plants to be visited. It will show the hotels, parks, theatres, railroad stations, and other points of interest to the visiting members. Over on the side will be a list of every plant which has signified its willingness to be visited, for instance—Russel Wheel & Foundry Co., will state where it is and an arrow will point directly to R. W. & F. on the map, and also the general direction, what car to take, when to get off, etc., etc. When the little group arrive at the plant, they present the card and are shown through by some representative of the firm, who will be provided for that purpose. This folder is in the printers' hands at the present time. It will give a man or one or two dozen men an opportunity at any time he has during the convention which he might select, to visit those plants.

There will be, however, 1 or 2 of the largest companies in Detroit who will be visited in a body. The Solvay Process Co. have invited the Foundrymen to visit the coke plant, and the Detroit Iron & Steel Co. have also signified their willingness to have members visit their blast furnaces, and will endeavor at that time to have a cast, if possible. These are the only two plants which will be visited in a body.

The boat-ride committee has chartered the Steamer Columbia, with a capacity of 3,400 people, which will take care of the crowd. Details of that ride are not yet settled, but the idea is to take the ride and show the visitors the City of Detroit, up around the island, giving them the view of the east side of the city, returning down, making a stop at the dock of the Detroit Iron & Steel Co., and Solvay Process Co., those wishing to go ashore at these places may go, those not wishing to do so may stay aboard, going down to the Livingston channel, which is rather an interesting piece of work. Then going back and picking up the visitors at the Coke ovens, coming back in time for dinner..

Entertainment.

Some excellent papers have been arranged for and the general discussion will add greatly to the educative features. The smoker will be the "best ever," a feature being the gift of a stein to each attendant.

The idea is to start after luncheon at noon and bring them back for dinner at 6 o'clock. There will also be a boat for the evening, which will leave the dock at 7.30 or 8 and return between 11 and 12. There will be music on the boat, both afternoon and evening, and dancing if desired.

On Monday night, the first night of the convention, it is planned to give a dinner at the Pontchartrain for the officers of the allied associations, that is to the American Foundrymen's Association, the Brass Founders' Association, the Foreman's Association, and a few representative members of the Technical Press, which will probably (including the Officers of the Detroit Foundrymen's Association and the chairmen of the General Committees) number about 65 or 70 people, possibly 90.

MAGNETIC METAL SEPARATOR.

The magnetic metal separator shown in Fig. 1, is manufactured by J. W. Paxson Co., pier 45 north Delaware Ave., Philadelphia. It is a simple machine, valuable for the separation of iron turnings, filings, etc., from brass, composition iron from emery, granular rubber, ores and other materials, and it is doubtless capable of various other applications.

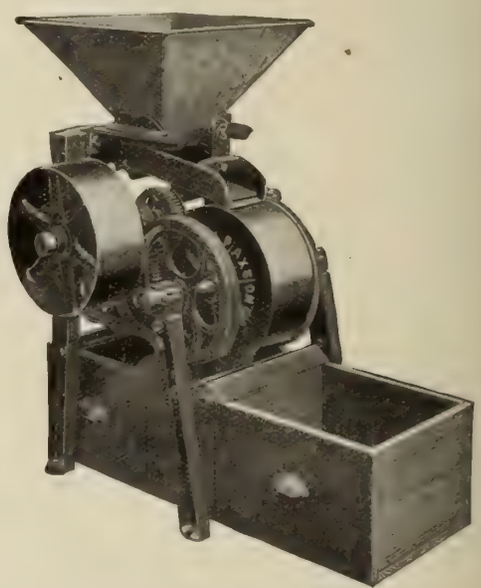

Fig. 1.—Magnetic Metal Separator, J. W. Paxson Co., Philadelphia.

The magnetic wheel shown in Fig. 2 and over which the mixed metals fall contains 300 magnets, to which the iron adheres ; the iron is then carried to the brush cylinder (Fig. 3) and there re-

moved, while the brass and other materials fall into the box shown in Fig. 1.

The capacity of No. 1 machine is from 1,500 to 2,000 lbs. in 10 hours, according to stock ; No. 2 machine 3,000 to 4,000 lbs.; No. 3, 6,000 to 8,000 lbs.

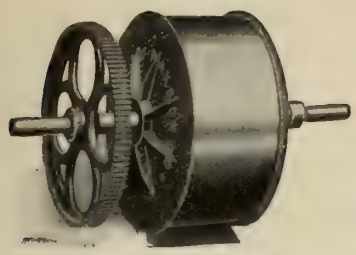

Fig. 2.—Magnetic Wheel, J. W. Paxson Co., Philadelphia.

In starting the driving shaft should be run 90 to 100 turns per minute. Size of pulley, 12 inches in diameter ; width of face, 2 inches ; a belt 1¼ inches in width will be sufficient to drive the machine.

Two important points must necessarily be observed in the use of the machine : (1) Remove the iron bands and replace them whenever the machine is not running ; raise also the brush. When it is running, do not drop brush too low, as it will wear out the brush and brass too quickly.

Fig. 3.—Brush Cylinder, J. W. Paxson Co., Philadelphia.

(2) The tray under the hopper should strike equally on each side, so as to distribute the stock evenly on the wheel. If you wish it to feed faster, draw the hopper forward. Place the boxes as shown in Fig. 1. The material in the middle box should be run through the second time.

TRYING IT OUT.

Many managers of shops and foundries are afraid to try novelties and it is certain that there is danger of a man going to the extreme in forever chasing new hobbies. Advancement, however, comes to those who study and try to keep abreast of the times.

Recently in visiting a plant where they were using a number of new things it was remarked that they had many handy kinks. The manager replied, "Some people may call us easy but the reason we have so many time-saving devices is because we always give our time to listen to anyone who comes here and claims that he can improve our practice. If the device shows any merit, we buy it ; we follow this rule even with the man who comes around with the "secret process" and the "special method." We often pay a fellow five or ten dollars and find that we have not received much. Occasionally we find some one who gives sufficient information to more than compensate us for the trouble and expense we have had with the others. Not long ago a man came in and told us that he could show us a kink that would make a material saving in one of our presses. We asked him how much he wanted for instructing us. He replied "Ten dollars." His device saved us at the least calculation $250 in the next three months."

That is an illustration of what a careful man may pick up from those who come to the plant. There is a class, however, which is to be avoided as their claims are preposterous and incapable of either proof or support.

Another cases which has come under our attention was that of a foundry foreman who had been with the plant since the early days when it had to struggle for its existence. He has devised a number of methods including some special machines which in those days had saved the company a good deal of money. Later on certain patent devices were brought out and the prosperity of the firm was made sure. With the development of the manufacturing operations the foundry grew to be a large proposition and it became necessary to introduce molding machines and other latest labor-saving appliances. The foreman, confident of his past success, was not any too receptive to take instruction in these new ideas. Neither did he see the advantage of visiting other plants. Naturally he felt that he was an A-1 foundryman and was frankly of the opinion that "he was just as bright as the next man you'll find."

A visitor in walking through the plant could not but notice that in some respects the practice was the latest and best while in others it was antiquated. The only men who are able to hold a reputation for stability without continued effort in their respective positions are those who rest in the graveyard.—Castings.

SOLVING SPOILED WORK PROBLEM

In an agricultural works there is a great deal of small foundry work. It is often a problem to look after the spoiled work and secure the total number of good castings. In the Frost & Wood Company's foundry at Smith's Falls, this has been provided for in a satisfactory manner.

The molders work piece work and the adjustments are easily made. There is a daily run, after which the castings are taken to the grinding room. Here the bad ones are culled out from the good. The timekeeper makes a list of the pieces giving the pattern number and number of pieces. The broken castings are then taken to the charging floor of the cupola.

The time-keeper makes out a list such as that shown herewith giving a list of the spoiled parts and the check number of the molder. The broken castings are deducted from the number sent in on the molder's piece-work slip. In order that a molder may know exactly how he stands, the sheet of "spoiled parts" is hung, each day, beside the check box.

With this system of looking after spoiled parts it is a simple matter to keep track of the total number made. When a requisition comes to the foundry for a certain number of castings, the number is written on a standard sized card and filed according to pattern number. When the spoiled parts are listed the number of the culls is deducted from the number sent in by the molder, and the number now left is listed on the total card. At any time, therefore, the foreman can tell how the work stands in his shop and how many good castings of any particular pattern have been made.

W. Norris, formerly of the London Street Railway, has accepted a position as manager of the Chatham, Wallaceburg & Lake Erie Electric Railway with headquarters at Chatham.

Owing to the illness of David Bain, superintendent of the Gananoque Axle Co.'s works, Gananoque, Thos. Scott, who for several years has been in charge of the company's warehouse, has been promoted to the position of assistant superintendent.

Three New Machines to be Exhibited at Detroit

The Adams Company, Dubuque, Iowa, will show Some Interesting Foundry Equipment at the Foundrymen's Convention at Detroit, June 6 to 10.

Three interesting machines that will be shown at the Detroit Foundrymen's Convention are the new Farwell Pneumatic Roll-Over Molding Machine, the new Farwell Squeezer designed for use with Keep Hinged Match Plates, the new 24 in. Stationary Farwell Squeezer with improved type of table and the new 34 in. Portable Heavy Duty Farwell Squeezer or Plow Point Machine.

Fig. 1 shows the Farwell Pneumatic Roll-Over Molding Machine without pattern. This machine jolts the mold as well as turning it over and drawing pattern. The combination of these features in a portable machine is new. You will note from the illustration that solid cast iron wheels are used, since they serve as an anvil on which mold is jolted. The wheels run on a track imbedded into the floor, thus affording an ample foundation at small expense, and without necessitating a permanent location of machine at one place.

The angle iron arm or table resting on the wheels carries the pattern and each side is provided with a heavy steel block, A, which receives the shock when mold is jolted. The holes in this angle iron are for the purpose of attaching the pattern which is clearly shown in Fig. 8.

Fig. 2 shows the flask in place, filled, ready to jolt.

Fig. 3 shows the operation of jolting which is accomplished by admitting air to the cylinder and exhausting, both of which operations are performed with the same valve, enabling the molder to control the machine entirely with one hand. After jolting and striking off, the bottom board is placed in position and secured by means of the adjustable clamps which are attached to the match board.

Fig. 4 shows the next operation. The molder opens the air valve again, admitting air to the cylinder and raising the mold to dead centre. After passing this point, the mold is lowered on to the cross pieces, B, by allowing air to escape. This can be done as quickly or as slowly as is desired.

Fig. 5 shows the mold as it has reached this position. The four plungers, C, are provided with springs which automatically equalize or adjust themselves to the irregularities of the bottom board on all four points, and as soon as mold rests upon the cross pieces, B, these plungers are locked in position by a single movement of the lever, D, which is connected by links to all four plungers. This lever, D, may be kicked into locking position with foot. The molder now releases the clamps and is ready to draw pattern.

Drawing the Pattern.

Fig. 6 shows the operation of drawing the pattern. The molder operates the air valve which admits air to the cylinder with his right hand, and with his left hand opens a pet cock, admitting air to the Adams Pneumatic Rapper which is mounted on the frame work carrying the pattern. The pattern is drawn perfectly straight to any desired height before starting to roll over, and this combined with the pneumatic rapper and the steady air control insures a good clean lift. It will be seen that as cylinder, E, is raised by the air pressure within, the pattern will be drawn straight until the yoke, F, strikes the pin, G, when the yoke must stop, making a fulcrum of the pin, H.

Fig 7 shows how the machine operates from the point on, the pattern describing an arc.

Fig. 8 shows the pattern as it has just passed dead centre, rolling back to its original position, ready to receive new flask and start on another mold.

The special features of the Farwell Pneumatic Roll-Over Molding Machine, are its great simplicity, the method of instantly clamping the plungers, so that the mold rests evenly thereon, the elimination of expensive concrete foundations, portability, the hinged clamps, easy control and the use of the Pneumatic Rapper in drawing the pattern.

Farwell Squeezer.

Fig. 9 shows the new type of Farwell Squeezer that has been developed for use in connection with the Hinged Match Plate system invented by W. J. Keep, superintendent of the Michigan Stove Co., Detroit.

This machine will be placed on the market for the benefit of those who adopt the Keep system and the Adams Co. will supply the squeezers as well as special equipment required to all foundries who are licensed to use Mr. Keep's invention.

The Keep system employs hinged snap flasks and a match plate provided with lugs which fit into the hinges of the flask, thus making it possible to roll up the cope and the pattern. In order to allow for this, the squeezer top is arranged so that it will swing farther back and the table is provided with a special flask supporting device not shown in the photograph. The flask supporting device operates two pins which support the back side of the drag when the cope is rolled up. This is necessary in order to prevent the drag from being tilted by the weight of the cope.

Stationary Squeezer.

Fig. 10 illustrates the new 24in. Stationary Farwell Squeezer which is very similar in construction to other Farwell Squeezers except that the table is raised higher above the rocker shaft, and it is not necessary for the top to swing through so great an arc in clearing the table. This makes it easier to bring the the top forward into squeezing position, while the new form of table brings the mold up above the links which connect the rocker shaft with the side arms, thereby making it possible to use a larger flask in proportion to the width of the machine, and removing the danger of molder striking his knuckles against these links when ridd'ing sand. This machine, which measures 24 in. between side rods, will take a flask 18 in. long or within 6 in. of the width of the machine, whereas on the ordinary 30 in. squeezer which measures 30 in. between side rods, flasks longer than 22 in. are not handled conveniently.

Plow Point Machine.

Fig. 11 illustrates the new 34 in. Portable Low Down Heavy Duty Farwell Squeezer or Plow Point Machine. This type of machine has in the past been built in 30 in. and 38 in. sizes only, and the 34 in. machine is a new addition to the line, possessing some special features not found on the other machines. The principal improvement on this 34 in. machine is the new style of counterbalancing spring which is adjustable to any tension. This spring can be set so that the squeezer top comes forward of itself, but, of course, it is ordinarily adjusted so that the top stays back out of the way until the mold is ready to be squeezed, when it is brought forward by a very slight pull. The leverage of the spring is so arranged that practically no effort is required either in pushing the top back or pulling it forward.

GLUTERIN MANUFACTURED IN CANADA.

The Robeson Process Co., Au Sable Forks, N.Y., recently began the manufacture of Gluterin, a sand binder, at Grand Mere, P.Q. Francis Hyde & Co., 31 Wellington St., Montreal, are selling agents for Canada.

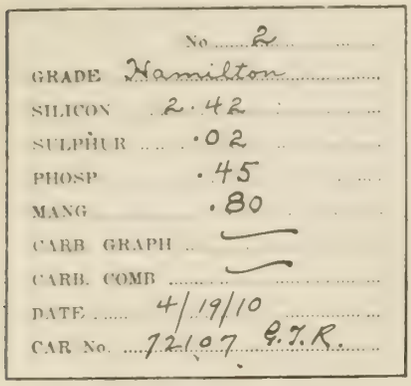
PIG IRON ANALYSIS.

In small foundries, it is customary to take the analysis of the company from whom the iron is purchased. A chemist cannot be engaged on account of the cost. For some work the analysis made at the furnace is sufficient. Care should be taken, when this is done, to prevent goods being mixed.

A good idea is to divide the stock-house into sections and when a car of iron is received with a certain analysis,



Pig Iron Analysis Card.

put the iron in one of the spaces and tack up a card in a prominent place to show the analysis. A convenient card is shown herewith.

Under "No." is given the space where the iron is placed. The per centages of the various ingredients is also given. It would be advisable to have the sections numbered, the figures being painted in a prominent place to designate the section. Then if, by any means, the card was knocked from its place, any one could tell where it belonged. Such an arrangement as described would greatly assist the foundry foreman in making up his iron.

NATIONAL IRON WORKS.

The National Iron Works, Cherry St., Toronto, which secured the site on Ashbridge's Bay from the city, held their first "pouring" on Monday, April 4th, at 1.30 p.m., when Cawthra Mulock "poured" the first pipe.

The building is among the best ventilated foundry buildings on the continent. At either end of the building are three immense windows, measuring 25 feet in height and 8 feet in width. It is therefore a well lighted place.

One of the men employed in pouring travels up in mid air on an iron box, which projects out from the side of the "ladle," which carries the molten iron. The big ladle is carried by an immense electric crane up at the top of the building.

The building is made of cement, steel and brick, and is absolutely fireproof. It has an asbestos roof. In the finishing-room, the pipes are taken after they are removed from the molds to be bathed in tar. The railway sidings to the plant are all completed, the G.T.R. having placed three sidings.

The company already has a large number of contracts on hand, including a large order for 16-inch pipe for Toronto to be used in the Rosedale waterworks, and also a big order from the Consumers' Gas Company. The Toronto Board of Control has also awarded the National Iron Works the contract for Toronto's 1910 requirements of 3, 4 and 6 inch cast iron pipe. It is estimated that twenty miles of 6-in. pipe will be required.

The contracts already booked by the National Iron Works have made it necessary for it to complete arrangements to double up the present capacity of the works. The contracts for the additional construction have already been let.

NEW MILLING CUTTER.

Radical departures from the old styles of face milling cutters are made in the new B. & S. Inserted Tooth Face Milling Cutter just brought out by the Brown & Sharpe Mfg. Co., of Providence, R. I. Means of quick release from the spindle and for interchangeability of the cutters are provided, features never before incorporated in cutters of this design.

These advantages will be readily appreciated by owners of shops as it will do away with the necessity of keeping a large assortment of cutters of various sizes on hand. It will also do away with the time now required to release cutters from the spindle after they have taken heavy cuts.

The cutter, which is keyed to a tapered split sleeve of steel when in position, is made with a taper hole sufficient to cause ready release and that will fit the sleeve which is screwed to the spindle. The cutter is drawn on by a clamping plate and drawing-bolt which holds it in close proximity to the spindle and allows a maximum amount of working space. By loosening the drawing-in bolt when the work is done the cutter can be easily removed.

In order that a cutter may be used interchangeably on more than one machine special sleeves are provided. These sleeves are made with the outside diameter the same size as the bore of the cutter while the inside of the sleeve will vary to fit the nose of the spindle.

PERSONAL NOTES.

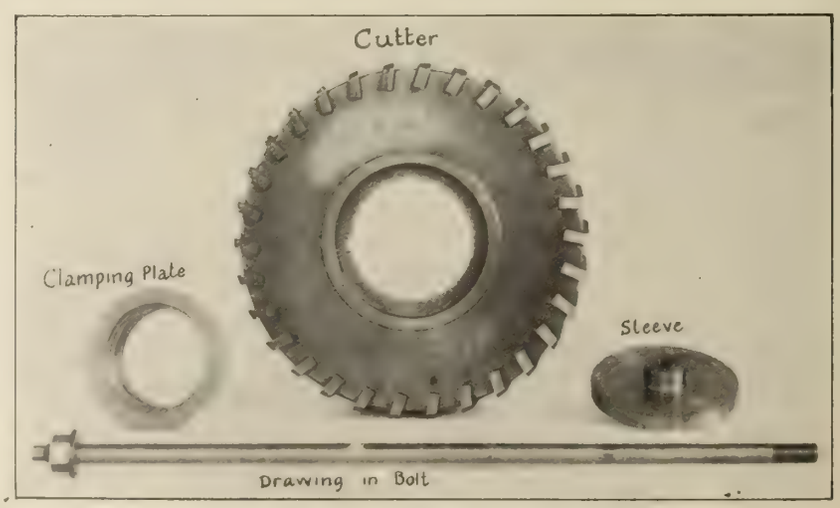
Eugene Stuart Bristol, president of the New Haven Mfg. Co., New Haven, Conn., died on April 2.

H. J. Fuller, president of the Canadian Fairbanks Co., Montreal, is on a trip to the Old Country.

Lawrence L. Anthes, of the Anthes Foundry Co., Toronto, is visiting Western Canada with a view of extending the connections of the company.

Geo. S. Seeber, of the Percival Plow & Stove Co., Merrickville, has resigned his position with that company, and will join his brother, Harry Seeber, in the Canadian Mercantile Agency, Ottawa.

H. H. Hurd, who has been secretary-treasurer of the Ontario Wind Engine and Pump Co., Toronto, for the past nine years, is removing to Winnipeg, where he will have charge of the financial interests of the company in the west. This change of residence has been found necessary owing to the rapid increase of the company's business in the western provinces. At a luncheon tendered him on leaving, Mr. Hurd was presented with a handsome walking stick as a token of esteem in which he was held by his co-directors. The presentation was made by S. H. Chapman, president of the company.



Inserted Face Tooth Milling Cutter, Brown & Sharpe.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Foundry and Machine Shop.

The C.P.R. will build a machine shop at Kamloops.

The C.P.R. will erect a machine shop at Yorkton, Sask.

The Scott Machine Co., London, will erect a new plant at London.

The Hamilton City Corporation will build a workshop to cost $8,500.

Reiffer Bros' brass foundry, St. Catharines, has been destroyed by fire.

Geo. White & Sons, London, will build a plant in East London to cost $50,000.

The Malleable Iron Works Co. will build an extension to their works at Oshawa.

Reid & Brown's foundry, Toronto, was damaged by fire about the middle of April.

The Dominion Government Mines Branch will establish an ore concentrator at Ottawa.

Gleeson Bros., carriage and wagon manufacturers, will enlarge their works at London.

The Albion Iron Works Co., Vancouver, foundrymen, have advertised their business for sale.

Surgeon Bros.' machine works, Qu'Appelle, Sask., were destroyed by fire last month. Loss $20,000.

Work was started last month on the 160 x 50 factory of the Modern Malleable Range Co., Chatham.

The machine works and garage of Russell Bros., St. Catharines, were destroyed by fire, loss $2,000.

The William Buck Stove Co., Brantford, have been authorized to increase its capital from $150,000 to $1,000,000.

The Atikokan Iron Company's blast furnace at Port Arthur will be placed in commission again as soon as navigation opens.

The Russell Harvester Co., formerly of Woodstock, will in the future be known as the Canada Grain Shocker Co., Hamilton.

The Dominion Radiator Co., Toronto, are planning important extensions of their plant, the details of which have not yet been fully decided.

The Corbett Foundry and Machine Co. will enlarge their present plant at Owen Sound by erecting an up-to-date foundry and machine shop.

The business conducted by the late Andrew Young, at 11 Busby Lane, Montreal, has been purchased and taken over by the Scotia Engineering Works.

A foundry for the manufacture of machinery was granted a loan of $15,000 by the city of St. Thomas for ten years to enlarge their plant and manufacture furnaces.

Among the extensions to the C. G. E. at Peterboro is an additional machine shop. Property close to the present one has been secured for the purpose.

The National Iron Works, Toronto, who secured the site on Ashbridge's Bay from that city held their first "pouring" on April 4, when Mr. Cawthra Mulock "poured" the first pipe.

The annual convention of the Gurney Foundry Co.'s Ontario traveling salesmen held at the company's King Street offices, Toronto, last month, was attended by about 30 salesmen.

The Canada Bolt & Nut Co., Toronto, have appointed two new agents, for Montreal, Bacon Bros., of Montreal, and for Quebec Province and Ontario east of Belleville, R. B. Coulson, of Montreal.

The contract for the new McCrae gasolene engine factory at Dunnville, has been awarded to Albert E. Faulkner, of Brantford. It consists of two buildings, 50 x 196, and 60 x 116. The contract price is $13,000.

L. H. Warner, of the Perrin Plow & Stove Co., Smith's Falls, has opened up an automobile and motor boat repair shop in Smith's Falls. He is installing a shop equipment of lathes, planer, shaper, drill, etc., for the work.

G. S. Seeber, manager of the Percival Plow and Stove Co., Merrickville, has resigned his position and will leave for Ottawa on June 1, where he will go into partnership with his brother, in the Canadian Mercantile Agency, Ottawa.

Canadian Gas-Power & Launches, Ltd., Toronto, manufacturers of stationary and marine engines and launches, are negotiating to increase their capital with the object of engaging in the manufacture of gasoline traction engines for the western market.

The contract for the erection of the buildings for the Canadian-American Gas and Gasolene Engine Co.'s plant, otherwise the McCrea foundry, at St. Catharines, has been given to Mr. A. E. Faulknor, Brantford. The amount of the contract is about $12,000.

The Canada Foundry Co., Toronto, recently accomplished a remarkable feat in the way of rapid construction. The eight-story structural steel frame work for the Standard Bank building, Toronto, requiring 475 tons of steel, was erected in 14 days.

The Labatt Manufacturing Company's plant at London, has been taken over by a company of London capitalists. The building, land, and appliances have been purchased for the sum of $35,000, and the manufacture of all kinds of brass goods will be undertaken.

T. J. Drummond, of Drummond, McCall & Co., Montreal, president of the Lake Superior Corporation, said at a recent meeting of the directors, that the corporation had recently booked an order from the C.P.R. for steel rails aggregating 100,000 tons, with a valuation close to $3,000,000.

T. Hilliard, sales manager of the Canada Foundry Co., Toronto, has returned from a lengthy trip through the Canadian West with very hopeful views of the outlook, owing to the continued rush of immigration and the great activity in railroad building and public works construction.

The Anhut Motor Car Co., of Detroit has decided to locate at Chatham. The capital of the American concern has been increased from $150,000 to $300,000, the stock and premises of the Chatham Motor Car Co. have been purchased, and the concern is in a position to start operations here at once.

The International Harvester Co., Hamilton, have secured a three-year lease of building and equipment subject to ratification of the Paris Plow Co. directors. It is practically a certainty that the directors will give their consent with such a strong company at the head of affairs.

It nas been settled that a branch of McLean, Holt & Co.'s foundry business at St. John will be started at Fort William. It has been stated that the company would amalgamate with T. McAvity & Sons, but James L. McAvity, proprietor of the former concern and a director of the latter, will neither confirm nor deny the report.

W. C. Hunter, of T. McAvity & Sons', St. John, employ has received a notice from Ottawa that the Hunter & Hatch car heating equipment of which he is the inventor, has been granted a patent for Canada. The equipment was given a test on C.P.R. and I.C.R. trains during the past winter and proved very satisfactory. The heating is done by means of exhausr steam from the engine.

The Scot Engineering Works, Montreal, have recently been acquired by Mr. Thomas O. Sinclair, late of the Hall Engineering Works, and of R. C. White, of the Clyde Iron Works, in succession to the late Andrew Young, at 11 Busby lane. Mr. Sinclair is well-known in the city, having had long experience in the shipping business of Montreal.

Manager Boyd of the International Harvester Co., Hamilton, states that its factory capacity will have to be increased to enable it to keep pace with the demand. The plant is behind in several lines including traction plows and engines, and gasoline traction engines for binding and harvesting operations. Reports from the company's seven distributing houses in the west show large increase in business and indicate that this will be a record year.

Henry Schaake, of the Schaake Machine Works, New Westminster, B.C., has found it necessary to meet the demands of business to incorporate the Schaake Machine Works, of Seattle, with the Western Gas Engine Co., also of Seattle. This will have no effect on the works at New Westminster which have proved a success. Besides Mr. Schaake, the incorporators of the new company are J. C. Johnson, who will be vice-president, and Carl Smith, the secretary-treasurer.

The Belleville Brass Goods Co., Belleville, are changing their name to the Springer Lock Mfg. Co., the reorganized company to be under the managing directorship of W. C. Springer, formerly managing director of the Belleville Hardware Co. A new foundry, 60 x 90 feet and one storey high, is being added to the plant in preparation for taking up the manufacturing of other lines of builders' hardware. About 60 men are now employed, and the number will be added to when the additions are completed.

It is said that the $30,000,000 merger planned by the Hamilton Steel and Iron Company, and which is planned to include the Canada Bolt and Nut Works with factories in Toronto, Brantford and Gananoque, and the Canada Screw Works, Hamilton, will fall through. It is understood that the charter of one of these companies makes it possible for any stockholder with a hundred shares to block a merger, and this is given as the reason why the Hamilton company is taking such pains to please the minority shareholders.

Plans are being worked out to make the Nelson Iron Works, Ltd., which absorbs the Nelson Iron Works and the Rossland Iron Works, the largest iron industry between Winnipeg and Vancouver. The new company which has been organized has for its officers: President, B. A. Isaacs; vice-president, Leslie Crawford; directors, S. S. Fowler, W. M. Cunliffe, R. W. Hinton. The field of the company will be extensive, including the Boundary, Kootenay and Similkameen districts of British Columbia, the Crow's Nest Pass coal mining district and Western Alberta. Mr. Cunliffe, formerly of the Rossland Iron Works, will be the manager of the company, and Mr. Hinton will continue to be superintendent.

The plans the C.P.R. have in view for improving the local yard at Kamloops, B.C., provide for an expenditure of $175,000. It is proposed to move the new station back 100 feet from its present position and straighten out the main track. This will enable the company to lay several additional tracks, and thus provide more accommodation for cars. It is expected that this improvement will give space for at least

steel frame cars, about double the present capacity. A machine shop will be built on the site now occupied by the old coal bunkers, which will be torn down. The shops will be commodious and equipped with modern machinery and give employment to a large staff of machinists. Six of the stalls, constituting the northwest wing of the roundhouse, will be torn down and replaced with larger stalls.

W. M. Cunliffe has sold out his interest in the Rossland Engineering Works, and it is the intention to move the plant to Nelson where it will be merged with that of the Nelson Iron Works. When the amalgamation is completed, a new name may be decided upon for the concern. The Rossland Engineering Works has been in operation here for about eleven years and have employed from ten to twenty men, turning out orders for as far away as the Yukon. It is not lack of business that has prompted the disposal of interests by Mr. Cunliffe, but with the two companies together the management can be more economical. Mr. Cunliffe will take part in the management of the amalgamated companies. The Rossland plant has made a specialty of wrought iron boiler work, and when the two plants are together the works will be as complete as any that can be found east of the coast cities.

George McAvity, president of T. McAvity & Sons, St. John, has recently returned from a visit to a number of United States cities, where in company with Mr. Barlow, superintendent of the foundry business, he was looking over foundries, with a view of getting ideas for the building of an enlarged plant. Mr. Barlow is still away, and is continuing his inspection of plants in various cities with an expert engineer. Before returning to St. John they will probably visit Port Arthur and look over the site that has been offered there. Mr. McAvity states that they must have a site that is accessible by rail and water and the plant which is to be built will employ at the start not less than 500 men and within two years would require from 800 to 1,000 men. A large amount of new machinery has already been ordered and Mr. McAvity says it will be necessary for them to decide very soon where they will locate, as the machinery will be ready for delivery in a short time, and they must know where to have it shipped.

Electrical Notes.

The town of Fergus will have Hydro-Electric power.

The electric light by-law at Waterford, Ont., was carried.

The town of Hanley, Sask., wants an electric lighting system.

Pemberton & Sons will instal a private power plant in the new Pemberton block Victoria.

The by-law at Wetaskawin, Alta., to raise $5,000 for extension of power plant has been carried.

The by-law to borrow $122,000 for the purpose of improving the light plant, at Coaticook, Que., was carried.

A permit has been issued at Winnipeg for the city power terminal station to be erected at a cost of $87,000.

The G.T.P. swing bridge at West Fort, over the Kaministiquia river will in the future be operated by electricity.

A new 150 h.p. boiler will be installed in the electric light plant in Fergus, Ont., replacing the smaller boiler now there.

John Houtwig's new $175,000 sawmill on the south side of False Creek, near Vancouver, will be operated by electricity.

Golden & Lansing contractors, Troy, N. Y., are laying conduits on east Adelaide St., Toronto, to the amount of $50,000.

The contract for the construction of an addition to the Hull power house was awarded to E. R. Bisson, of Hull, at $13,386.40.

The Continental Light and Heat Co., Montreal, are making large extensions and improvements to their system in the district of Thetford Mines, Que.

In order to raise money for the development of the water powers at Renfrew a by-law will be submitted to the ratepayers for $77,000.

The sum of $25,000 has been placed in the estimates of the Legislature to equip the London Hospital of the Insane with electrical fixtures.

The Brandon Electric Light Co. have applied to the city council for power to instal in the city of Brandon a system to supply heat for public use.

Kingston penitentiary has made an offer to the village of Portsmouth to supply electricity for street lighting, if the latter will erect and maintain poles, wires, lamps, etc.

Tenders for boilers, engines, condenser pumps and piping together with electrical apparatus are called for by Thomas Dunn chairman of electric light committee Prince Rupert up till May 3.

The New Liskeard Light, Heat and Power Co. have issued a writ for $40,000 damages against the High Falls Mining Co. The plaintiffs claim exclusive right to supply electricity to Haileybury.

The city of Kamloops agrees to take power from the Shuswap Power Co. in accordance with Engineer Dutcher's recommendation. When the matter is finally settled, the company will spend it is estimated, about a million dollars.

The Calgary Power Co. are spending $1,500,000 in the construction of a dam and plant, which will have a reserve force of water about two miles and between sixty and seventy feet in height and 350 feet broad. The dam is located 40 miles west on the Bow river.

The Crown Electrical Co., St. Charles, Ill., will establish a branch concern at Brantford, to employ 75 hands at the commencement. A building will be erected immediately. The company manufactures electrical and gas fixtures, and have already a good business established in Canada.

The announcement of the incorporation of the International Electric Co., Nelson, capitalized at $1,000,000, with $400,000 fully paid up, to develop power from the Pend D'Oreille river from its junction with the Salmon river, is causing much interest. The company proposes to use 4,000 cubic feet per second.

Canadian shareholders of Northern Ohio Traction & Light will be interested in the plans of the company to spend $1,500,000 on a new powerhouse, near Akron, Ohio. It will take the place of smaller power-houses at Bedford, Cuyahoga Falls, Akron, Canton and Midvale.

City Engineer Speakman, of Brandon, has prepared plans for the establishment of a steam generating plant, capable of furnishing sufficient power to operate a street railway, the pumping station and street lighting, and have about 300 horse power in reserve. A public steam heating system would also be served. Estimated cost $125,000.

The West Coast Power Co., Victoria, are making application for a water record of 3,500 feet per second on Gordon river, Vancouver Island, just below the Big Canyon. It is calculated that 110,000 horse power can be developed with this amount of flow and with a 300-foot head. It is stated the works will occupy an area of 100 acres.

The Canadian General Electric Co. will extend its plant at Peterboro and expend $250,000 in the undertaking. The company will erect a power house at the new waterworks dam, to generate power for their own purposes, and will pay to the city $2,000 per year. At the end of twenty years the company will hand the plant over to the city without charge.

The Edmonton citizens voted on April 21 on a by-law to issue $30,000 debentures for the purpose of extending and improving the municipal electric system; also on the same date on a by-law to issue $60,000 debentures for the purpose of erecting, etc., car barns for the municipal street railway system; also on the same date a by-law to issue $260,500 debentures to extend and further equip the municipal street railway system.

McCuaig Bros. & Co., Montreal, have purchased the Sherbrooke Street Railway; also water powers in the vicinity. It is the intention to extend the road considerably. A large amount of money will also be expended in developing the power plants.

Municipal Enterprises.

Hamilton's trunk sewer will cost $476,275.

The proposed sewer at Kingston will cost $19,000.

A sand filtration plant has been recommended for Brockville, Ont.

The Nassaweya, Ont., ratepayers will vote on a $10,000 drainage by-law.

Engineers are engaged in preparing plans for the Regina sewerage scheme to cost $350,000.

G. H. Bryson, acting engineer, of Victoria, in his report on the reservoir states that repairs will cost about $30,000.

Tenders will shortly be invited for approximately eighty tons of castings required by the waterworks at Vancouver.

Tenders are being called by North Battleford, Sask., for pipes, hydrants, etc., in connection with the waterworks system.

The by-law to raise $40,000 to complete the waterworks and sewer installation at Wetaskiwin, Alta., has been carried.

The Quebec council is calling for tenders for the annual supply of iron castings, brass castings, lead pipe, pig lead, and drain pipes.

L. H. Buck will submit to the Chilliwack, B.C., council a scheme for a drainage and sewerage system.

The following by-laws were carried at Regina, Sask.: waterworks extensions, $10,000; sewerage extensions, $10,000.

The London city council awarded a contract for 2,000 feet of rubber hose to the Mechanical Rubber Co., of Cleveland.

The Township of Etobicoke have awarded the contract for sewers to I. M. Scott, Lambton Mills, Ont., at $4,727.93.

Tenders have been called for the supply of 137,000 pounds of lead pipe for the Winnipeg waterworks department.

The estimates made by the London Water Commissioners include: Service extension, $6,000; main extension, $10,000; meters and hydrants, $7,500.

The Ontario Railway Board has given Toronto permission to issue $45,000 debentures to cover the cost of laying trunk sewers in the east and annex.

The by-law to issue debentures to the amount of $100,000 for extending and improving the waterworks at Hamilton has been passed by the council.

The Winnipeg Board of Control recommends that the contract for supplying water pipe be awarded to the Stanton Iron Works, Montreal, at $18.131.

The by-law to authorize the issue of debentures to the amount of $50,000 for the purpose of constructing a system of waterworks at Fort Erie, Ont., was carried.

Prescott, Ont., will shortly invite tenders for the extension of their sewerage system, including one septic tank. A by-law to raise $22,000 for this purpose has been carried.

The Toronto Board of Control awarded the contract for one 42-inch hydraulically operated stop valve for the main pumping station to Canadian Fairbanks Co., Toronto, at $1,180.

City Engineer Ker, Ottawa, submitted plans for the west end drainage system with a septic tank in Mechanicsville. The plans will now be forwarded to the provincial board of health for approval.

The St. Thomas power committee awarded the contract for general supplies to Ingram & Davey at $1,561.44, and The Gartshore Foundry Co., Hamilton, will furnish 30,000 tons of cast iron pipe at $34 per ton.

Five large water mains will be laid on Trolley, Britannia, Kensington, Cannon and Prospect

Streets, Hamilton, and the services installed as quickly as the people apply for them. The construction of these mains will cost about $19,000.

The Aylmer, Ont., Water Commissioners have purchased land for a reservoir and work will be commenced at once on a pipe line. It is estimated that this will give the town from three to five hundred thousand gallons more water a day, at an initial cost of $12,000.

The contract for the manufacture of reinforced concrete tile for storm sewers on Brant Avenue, Waterloo Street, and Albion Street, Brantford, has been awarded to the Lock Joint Pipe Co., New York, on the condition that the pipe be manufactured here, and local labor employed.

The Winnipeg city engineer reports that the estimated cost of a sewer in Godfrey Avenue, from Cambridge Street to the city limits, was $23,563; that of a main sewer in Ash Street, from Assiniboine river to Godfrey Street, is $38,225; and a main sewer in Crescent Road, from Ash to Renfrew, will cost $49,772. The cost of the sewer in Renfrew, from Crescent Road to Godfrey, is placed at $10,263, making a total of $121,823.

The Kingston Waterworks Committee recommend that tenders for supplies be awarded as follows: Selby & Youlden, hydrants, etc.; Francis Tracy, steel drills, picks, etc.; Chadwick Bros., service cocks; Canada Foundry Co., valve, etc.; Gartshore, Thompson Pipe & Foundry Co., cast iron piping; Queen City Oil Co., oil; Simmons Bros., block tin, waste, etc.; W. B. Dalton & Sons, fire clay, shovels, etc.; McKelvey & Birch, lead piping, galvanized piping, fittings, etc.

The following tenders for water works supplies for 1910 were recommended for acceptance by the Calgary council: Canadian Brass Co., Galt, brass work for house services, $2,357. J. Robertson Co., Winnipeg, pipe lead, $5.50 per 100 lbs., pig lead, $4.62 per 100 lbs. Gurney Standard Metal Co., oakum, $3.75 per 100 lbs. Crane & Ordway, Calgary, galvanized iron pipe, $3,175. Calgary Ironworks, Calgary, valve boxes, $4 per 100 lbs., and hydrants, $50 all sizes without crane attachment. Canadian Foundry Co., Toronto, crane posts, $54.10; specials, $3.20 per 100 lbs. Bissett & Loucks, Winnipeg, valves, $2,989.30. Union Iron Works, Calgary, hydrants, 8 ft., $49.50; 8 ft. 6 in., $50; 9 ft., $51.50 without crane attachment, with crane attachment $5 extra. Evans, Coleman, Evans, Vancouver, cast iron pipe.

Structural Steel.

The highway bridge at Fredericton is completed. The total cost was about $285,000.

The Brantford city engineer will ask for tenders for a new concrete, steel reinforced bridge over Market Street, approximate cost, $50,000.

The Hamilton Bridge Works have been awarded the contract for the structural steel work on the Sawyer-Massey Company's new building, at Hamilton.

The corporation of St. Johns have bought a steel vehicular bridge from the city of Pittsburg, Pa. The bridge will span the river between St. Johns and Iberville. The bridge was bought at one and one-tenth cents per lb. The total cost delivered in St. Johns will be about $8,500.

The presentation of plans for the proposed new bridges over the Great Northern Railway cut at Victoria and Park drives, Vancouver, are under consideration and call for 30 and 42 foot width respectively, with 26 foot walks on each. Both bridges will be of steel of the deck design and will cost approximately $18,000 to $20,000.

Planing Mill News.

O. H. Moxley is building a new mill at New Liskeard, Ont.

Dickenson & Scott are erecting a sash and door factory at North Vancouver.

Culliton Bros. are erecting a new sawmill at Loon Lake, near Albernie, B.C.

The Chicoutimi Pulp Company's new mills at Chicoutimi, Que., are completed.

The Cleveland-Sarnia Saw ills Co., Sarnia, will build a planing mill to their plant at that place.

J. Kaufman, Berlin, Ont., will erect an addition to his planing mill. Estimated cost about $14,000.

John Hanbury, of Brandon, will erect a lumber mill on the south side of Falls Creek, B.C. to cost $175,000.

The Toplin Timber Co., of Toronto, are erecting a saw-mill on the shore of Lake Sasaquiaga, near Cobalt.

Jas. McDiarmid & Co. have been awarded the contract to construct the planing mill at the C.P.R. shops at Winnipeg.

Leslie Bros'. planing mill at Mount Forest, was completely gutted by fire. The mill was partly covered by insurance.

Galbraith & Airth, Chatsworth, Ont., will move their sawmill and sash and door factory to Owen Sound in the near future.

The Watt Milling & Feed Co., of Toronto and Shelburne have now a complete planing mill and sash and door factory in Shelburne. The building was overhauled and enlarged last fall and a number of new up-to-date machines installed.

Engines, Generators and Boilers

FOR SALE IN GOOD ORDER AND CONDITION.

Boilers.

1 Robb-Mumford boiler rated at 150 h.p.; working pressure 125 lbs. per square inch; heating surface 1220 sq. ft.; grate surface 24½ sq. ft.; built 1898. Some tubes require renewal.

1 Cornish boiler, built by the John McDougall Co.; working pressure 80 lbs. per square inch; heating surface 224 sq. ft.; grate surface 8½ sq. ft.

Engines and Generators.

2 75 kilowatt direct connected engines and generators. Each engine has a cylinder 12" diameter x 14" stroke, suitable for 120 lbs. working pressure.

Each generator is of 600 amperes capacity at 115 to 150 volts direct current, and runs at 270 revolutions per minute.

Unit No. 1 consists of a Robb engine connected to a Crocker-Wheeler generator.

Set No. 2 consists of an Ideal engine connected to a Canadian General Electric Generator.

These sets are both 9 years old. They can be seen running at any time by appointment.

The machinery is offered for sale as it stands in the Macdonald Engineering Building, McGill University, Montreal, and purchaser must undertake removal.

W. VAUGHAN,
Bursar, McGill University.

Editor Wanted

High-grade Editorial Man wanted for this journal. Must be graduate in mechanical engineering and with some experience in shop management.

Applications will be treated in strictest confidence.

Ker & Goodwin
Brantford, Canada

The property of the Fraser River Lumber Co., New Westminster, B.C., has been acquired by the Canadian Western Lumber Co. The Fraser River Co. is said to be the largest in the world. The amount involved in the sale is almost $20,000,000.

Atkins & Hardy are the movers in a new industrial concern, which will be established at Owen Sound. They were in Toronto last week, and purchased machinery for the manufacture of wood fibre. And have let the contracts for the erection of a concrete building, 40 x 60 feet.

John Pierson's heading box and planing mill factory at Stevensville, Ont., was destroyed by fire, with the contents, machinery and manufactured lumber and the lumber piled nearby. A lot of new machinery was lately put in. Loss about nine thousand dollars, without any insurance.

General Manufacturing News.

Hon. Adam Beck will build a box factory at Winnipeg.

The Canada Cement Co. will erect a cement mill at Winnipeg.

The N. C. Polson Co. will erect a factory and warehouse at Kingston.

The Knechtel Furniture Co. will erect a new factory at Hanover, Ont.

F. C. Durant will erect a sugar refinery at St. John to cost about $2,000,000.

The Canada Loose Leaf Co. will erect an addition to their factory at Montreal.

The Brantford Cordage Co. will make extensions to their factory at Brantford.

The Coleman Baking Co., Toronto, will build a bakery at Winnipeg, to cost $50,000.

The Cockshutt Plow Co. will make large extensions to their plant at Brantford.

The Plymouth Cordage Co., Welland, will erect a 300 foot addition to their storage and warehouse facilities.

Work has been commenced on the new building for the Kingston Shipbuilding Co., Kingston. It will be 125 x 62 feet, two storeys high.

The Shurly & Dietrich Co., Galt, will erect an addition 100 x 45 feet, of reinforced concrete with fire-proof roof, for storage purposes.

W. C. Cuthbert Ward, of the firm of J. H. Andrew & Co., Toledo Steel Works, Sheffield, Eng., is in Canada in the interests of his firm.

The Stone, Limited, have been granted a permit to erect an addition to their factory at 461 King Street West, Toronto, at a cost of $35,000.

The Allan Hills Edge Tool Co., Galt, is now employing 40 hands, after four months' operation. The demand for their products is steadily increasing.

The Canadian Slate Products Co., capitalized at $2,500,000, will commence the erection and installation of their plant at Vermilion, Alta. in the near future. Estimated cost about $1,000,000.

The Empire Refining Co., Wallaceburg, announce that building operations will be started at once on a $26,000 addition to the refinery which will be utilized for the manufacture of candles and wax in all its forms.

The St. Catharines ratepayers voted on by-laws to grant exemption to the Canadian Crocker-Wheeler Co., Monarch Knitting Co. and the St. Catharines Woollen Mills Co., on April 22 all three being carried by large majorities.

A new industry is about to be established in the city of Quebec, when the Crown Rubber Shoe Company will start operations in the new ward of Limoilou. The factory will employ 200 people and will produce an average of 2,000 pairs of rubbers daily.

The St. Thomas, Ont., by-law to loan $10,000 to the C. Norsworthy Co. for ten years without interest to enable them to go into the manufacture of furnaces, stoves, etc., has been carried. The by-law to loan $15,000 to the Nursery Shoe Co., Toronto, for ten years, with three years' interest was also carried.

Fire broke out in "B" elevator of the Calgary Milling Co., Calgary. The cause was spontaneous combustion. One hundred thousand bushels of grain were burned. The total loss in grain and building was $300,000. The insurance is light. The elevator had a capacity of 250,000 bushels, and was erected in 1905.

The Onward Manufgcturing Co., Berlin, announce that they intend erecting an addition to their factory, as the present building is inadequate for the manufacture of their sliding furniture shoes. Their vacuum cleaner business is also growing rapidly, as hardware dealers have found their sale a profitable side line.

It is announced that a deal has been effected whereby Chatham Bent Goods Co., Chatham, which has been idle since last fall, will resume operations. The plant and premises have been acquired by Merritt & Co. There is also talk of a new bent goods factory being started by some of the men formerly connected with the old concern.

The agreement between the city of St. John and the David Craig Co., Boston, whereby the Craig concern secures a lease of property at Green Head, for establishing a plant for the manufacture of concrete blocks for building purposes, was signed last week and the work of getting the buildings and machinery in place will commence on May 1.

The Hanbury Mfg. Co., whose head office is at Winnipeg, announce that they will at once double the capacity of their whole establishment, factories, mills, warehouses and offices, which will result in hundreds of extra hands being employed and thousands of dollars worth of new machinery being installed. The company exdects to have these improvements completed by June 1.

The B. F. Nelson Co., manufacturers of roofing and building material, Minneapolis, are about to open several branch offices in the west where complete stocks are to be stored. In the near future a plant is to be erected somewhere in the west for the manufacture of their materials. The Canadian business of the company is to be in charge of F. P. Barker, formerly of the American Roofing Co., Kansas City.

Building Operations.

Calgary Odd Fellows will erect a $100,000 temple.

The Grey Nuns will a new building at Regina, Sask.

A $12,000 school house will be erected at Elbow, Sask.

Douglas & Co. will erect a warehouse at Winnipeg.

A new Anglican church will be erected at Merritt, B.C.

The new Orpheum theatre at Winnipeg will cost $150,000.

The new Y.M.C.A. building at Winnipeg will cost $300,000.

L. Christie will erect a $10,000 block at Fort Frances, Ont.

Finch & Finch will erect a three-storey block at Victoria, B.C.

J. Vaio will build a business block at Victoria to cost $10,000.

A new isolation hospital will be erected at Vancouver, B.C.

W. Holden is erecting a $250,000 building at Vancouver, B.C.

The new building for the Y.M.C.A. at Halifax, will cost $150,000.

The McClary Mfg. Co. will erect a new warehouse at Calgary.

Willis & Co., Montreal, will erect a new building at that place.

R. Howson & Co. will erect a business block at Revelstoke, B.C.

The Tourist Hotel Co. will erect a new building at Kenora, Ont.

An apartment block will be erected at Winnipeg to cost $350,000.

The Union Bank will erect a $150,000 office building at Toronto.

The Canada Veiling Co. are erecting a $76,000 building at Toronto.

Mr. Moriarty, of Spokane, will build a business block at Calgary.

Amos Shulk will erect a $20,000 apartment house at Toronto.

An Anglican church will be erected at Lethbridge to cost $100,000.

S. Hinaccal will erect a cold storage plant at Winnipeg, to cost $80,000.

The First Methodist congregation will erect a new church at Hamilton.

A new municipal building will be erected at Sudbury to cost $25,000.

An annex will be erected to the Montreal City Hall at a cost of $175,000.

H. A. Sinnot, Calgary, will build a large business block at Lethbridge.

An annex will be built to the Brunswick hotel, Winnipeg, to cost $22,000.

J. A. Seabold will build a business block at Vancouver to cost $78,000.

An English syndicate will build a warehouse at Winnipeg to cost $100,000.

Sweeney & McConnell will erect a building at Victoria to cost $15,000.

A. B. Kent will erect an apartment house at Winnipeg to cost $50,000.

The Bank of Montreal will erect a building at Winnipeg to cost $950,000.

A new school house is being erected at Westboro, Ont., to cost $15,000.

The G.T.P. will erect a 10,000,000 bushel elevator at Port Arthur, Ont.

Stanfields, Ltd., will erect a large building at Truro, N.S., to cost $50,000.

MacMillan & Vollans will build an $80,000 apartment house at Winnipeg.

The Royal Canadian Flour Mills Co. will erect a large plant at Kenora, Ont.

An armory will be built next year at Prince Albert, Sask., to cost $10,000.

Trade Notes.

The Philip Carey Mfg. Co., manufacturers of insulating materials have moved their Toronto offices from 112 Bay St. to 77 Front St. East.

The General Supply Co., Ottawa, have removed their office and warerooms to 356-358 and 360 Sparks St., where they will have more commodious quarters.

The Sclater Asbestos Co., Montreal, will move about May 1st from their old offices, 102 Nazareth St., to new quarters at the corner of Brennan and Dalhousie Streets.

The Cleveland Twist Drill Co. will move their Chicago branch to 9 North Jefferson St. In their new location greatly improved facilities for the prompt handling of their steadily increasing business are afforded.

The Magnolia Metal Co., 113-115 Bank St., New York, are erecting new offices and factory at 223 St. Ambroise St., Montreal. The factory has been specially designed for their requirements and they expect to occupy it by May 1st.

The Canadian Laboratories, of which W. K. McNeill, B.Sc., is manager, have removed their offices from 37 Melinda St., to 24 Adelaide St., West, Toronto. Ores, fuels, alloys, cements, pig iron, steel and other commercial products are tested and analyzed by this company.

The following tenders for supplies of cast-iron pipe have been accepted by the Toronto Board of Control: National Iron Works, 3-inch pipe, $4.35 per length; 4-inch pipe, $4.88 per length; 6-inch pipe, $6.97 per length. Canada Foundry Co., 8-inch pipe, $10.50 per length; 10-inch pipe, $14.80 per length; 12-inch pipe, $19.85 per length.

R. A. Brown, for the past sixteen years associated with the Joseph Dixon Crucible Co., at Jersey City, known throughout the world as the "Oriental Man," has severed his connection with that house, and is now associated with the Jonathan Bartley Crucible Co., of Trenton, New Jersey. At the present time, Mr. Brown is on his way to South Africa, and will make an extended trip covering all parts of the globe.

Smart-Turner Machine Co., 191 Barton St. E., Hamilton, report the following recent orders for pumps: Doolittle & Wilcox, Dundas; Millers Tanning & Extract Co., Millerton, N.B.; Contracts, Ltd., Bracebridge; Algoma Lumber & Chemical Co., Parry Sound; Edwin Crabtree & Sons, Crabtree Mills, P.Q.; I.C.R., Moncton, N.B., Kent School, Toronto; Blangas Co., Montreal; Slingsby Mfg. Co., Brantford; Great Lakes Dredging Co., Port Arthur; Keenan Woodenware Mfg. Co., Owen Sound; and Waines & Root Gas Co., Dunnville, Ont.

The Canada Forge Co., Welland, are remodelling their steel heating plant and have placed a contract with the Standard Engineering Co., Toronto, for the new furnaces, which will be equipped with type M American mechanical stokers burning slack coal. Another contract recently placed with the Standard Engineering Co., is a steel heating furnace for the Superior Steel Co., Toronto. This latter is equipped with a No. 5 type R American mechanical stoker. The furnace will be used in connection with the new process of making steel direct from iron.

The Simonds Mfg. Co., of Fitchburg, Chicago and Montreal, make announcement of the completion of plans for the erection of a new steel mill at Lockport, N.Y., that will at once double the capacity of their Chicago mill and before long increase the first Lockport output. The contracts call for completion of the building and installation of machinery so that production will begin by October 1. The initial investment will be fully a quarter of a million dollars. In addition to the three plants and the new steel mill, the Simonds Mfg. Co. has branch houses at New York, Portland, Ore., Seattle, Wash., New Orleans, San Francisco, Vancouver, B.C., St. John, N.B., and London, England.

The Welland Canal.

The Toronto branch of the Canadian Manufacturers' Association and the Council of the Board of Trade passed resolutions on April 14 urging the deepening and improvement of the Welland Canal. Copies of the resolutions will be forwarded to Sir Wilfrid Laurier and members of the Ottawa Government.

C. N. R. Shops for Toronto.

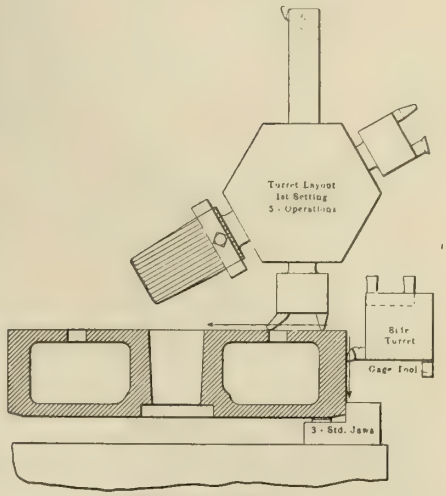
D. D. Mann, vice-pres. C.N.R., says that the C.N.R. shops will be built in Toronto. A request has been sent to the Toronto city council for a fourteen foot right-of-way on the east bank of the Don River, but no definite action has been taken by the council.

Two Thousand Steel Box Cars.

The C.P.R. has just placed with the Dominion Car and Foundry Company the second million-dollar order this year for a thousand steel frame 80,000-lb. box cars. The cars covered by the order placed at the beginning of the year are being turned out at the rate of 15 per day, representing a cost of about a thousand dollars apiece.

Side Head of the Vertical Turret Lathe

A Big Factor in Reducing the Cost of Production of Many Kinds of Face Plate Work.



First Setting, First Operation.

Perhaps the greatest productive difference between modern and pre-modern machine tools is the doubling up or "tripling" up of cutting tools. One cut at a time is no longer sufficient to get competition-meeting results, and it was the realization of this fact that led to the designing of the Bullard Vertical Turret Lathe.

Besides the main turret head this machine has a side head which enables the operator to take simultaneous cuts on various surfaces. It does not interfere in any way with the operation of the main head.

The illustration herewith shows a job on which the Vertical Turret Lathe made a new record of 90 min.

The piece is a 27½ in. piston on which simultaneous cuts with the Side Head cut 30 minutes from the best previous time.

The Vertical Turret Lathe has two heads—a turret head and a side head—which allow two or more tools to be used at the same time.

All the tools needed for a whole series of operations are held in instant readiness.

In a word the Vertical Turret Lathe is a unique combination of the good points, the advantages of the vertical boring mill and the horizontal turret lathe.

Its vertical construction allows many a piece to be finished before it could be chucked ready for work on a horizontal turret lathe. For modern work—especially for duplicate pieces—the Bullard Vertical Turret Lathe is an innovation. It is a tool you must know about.

The entire sequence of operations on the piece shown here and other pieces is graphically illustrated in our new catalog, which is free for the asking. Send for catalog C-15.

The Bullard Machine Tool Co.
Bridgeport, Conn., U.S.A.

60 Days' FREE TRIAL!

An accident may happen any day in your shop, but often enough the damage done may be minimised by the prompt application of suitable remedies.

Alike from the humane and the economic standpoint, the employer of labor serves his own interests best if he keeps handy a stock of remedies for any emergency.

The Factory Emergency Cabinet

is designed to meet every requirement in rendering first aid, and to introduce it into every shop in Canada we will send it on 60 days' free trial. If at the end of that time you find you can do without it—send it back at our cost. If not, send the price, $9.50, f.o.b. TORONTO, duty paid. Write us to-day.

JUST LOOK AT THIS

Improved Power Hack Saw

It is better made than any tool of a similar nature you ever saw before. Only the best of material is used in its construction, and your particular attention is directed to the improved arm and saw guide which keeps the saw perfectly in line. This saw cuts either round or square bars 6x6 in., and requires no attention after the work is in the vise.

IT STOPS AUTOMATICALLY WHEN THE PIECE IS CUT OFF

SEND FOR CIRCULAR AND PRICE

D. McKENZIE, 9 NOTTINGHAM STREET **GUELPH, ONT.**

Both orders have to be completed so that all the cars will be available for this year's harvest.

G.T.P. Shops, Winnipeg.

The extensive shops of the Grand Trunk Pacific at Winnipeg are rapidly taking the form of finished buildings. The roundhouse is already roofed in and more than one half of the five thousand tons of steel used in the construction of the shops has been riveted in place. There will be thirteen separate buildings, eight departments, eight buildings of steel construction and five buildings of reinforced concrete. The shops and grounds will cover 300 acres and there will be seventeen acres of floor space in the thirteen buildings. The main building alone will be 130 feet wide, 880 feet long and 47 feet high. These shops will employ about 2,500 men to begin with, which force will be increased to 5,000 as business justifies. The work is expected to be completed by the end of this year.

Edgar Allen Manganese Steel Co.

To meet the constantly increasing demand in America for their Stag brand manganese steel products and particularly for railroad frogs and crossings, Edgar Allen & Co., Ltd., of Imperial Steel Works, Sheffield, England, are at present engaged in the erection and equipment of an up-to-date and very extensive plant at Chicago, Ill., for the manufacture of their specialties. This branch of their organization has just been incorporated at Springfield, Ill., under the name of Edgar Allen Manganese Steel Co., with a capital stock of $300,000. Edgar Allen & Co., Ltd., maintain a sales office and warerooms at 330 St. James St., Montreal.

C.P.R. Fort William Shops to be Enlarged.

The C.P.R. machine shop, at Fort William, is to be doubled in capacity. An addition of 128 feet by 70 feet is to be built to the present shop, which when completed will make the machine shops in Fort William the next largest on the main line to those at Montreal, Winnipeg and Vancouver. Tenders for this structure are now being called for, and the award is expected to be made next week. With the enlarging of the machine shops it has been made known that Fort William is to be the headquarters of the mechanical department between Winnipeg and Chalk river. This will mean that all repair work to the locomotives between Chalk River and Winnipeg will be made at the Fort William shops. Already, it is said that $70,000 worth of machinery has been ordered for the new shops and that it will be shipped when the building is completed. In order to carry on the work in the new shops it will be necessary to increase the staff.

Wealth of Canada's Mines.

The mineral output of Canada last year was $90,000,000, an increase of 50 per cent. over that of five years ago, and five times that of fifteen years ago.

The value of the mineral output of the Province of Ontario at present is about $40,000,000, or one-third of that of the whole Dominion. This is four times what it was ten years ago.

The SMART-TURNER MACHINE COMPANY, Limited

HAMILTON, - ONT.

The railway development of Canada has in the past made known vast areas of mineral wealth, and will no doubt lead to the discovery of still greater deposits, especially in the region around Hudson's Bay.

Canada has sixteen hundred miles of Rocky Mountains, and the same range in Mexico and the United States produces about three million dollars' worth of precious metals to the mile.

Quebec's Progress.

With the many vast enterprises that are to be achieved in Quebec within the next five years, this city is about to enter on an era of progress that will considerably change the face of things and turn the ancient Capital into one of the most progressive and busy cities in the Dominion.

A brief estimate of the work to be done shows that no less than thirty-six millions and a half will be spent in Quebec during the next five years, and a detailed examination shows the cost of the various works as follows :

Quebec bridge and approaches,$10,000,000.

Dry dock and ship-building yards, $5,000,000.

Grand Trunk Pacific terminals, $3,000,000.

Quebec and Saguenay Ry., $2,000,000.

Q.R.L. and P. Co.'s improvements, $1,500,000.

Customs house and other Government public buildings, $1,000,000.

Harbor improvements, including extension Louise Dock, etc., $2,000,000.

Canadian Pacific Hotel and station extension, $1,500,000.

Four thousand new houses at an average cost of $2,000 each, $8,000,000.

Civic improvements in Limoileu, etc., including two bridges over the St. Charles River, $500,000.

Battlefields Commission, $1,000,000.

Orillia, Ont., Prosperous.

The E. Long Co. are constructing a $50,000 machine plant.

The Dominion Government will construct an armory this summer on the Agricultural grounds.

T. A. Main will construct a large new block containing three store on the main street, costing $20.000.

Mayor Goffatt has been informed by Mr. Andrew Carnegie that a grant of $13,500 has been made for the purpose of constructing a free public library for Orillia. Tenders for this work will be asked for.

The Roman Catholic congregation will commence building next week a new $50,000 church. The Methodist and Presbyterian congregations are also commencing next week to build Sunday Schools costing about $30,000 each.

The Tudhope Carriage Co. are constructing a large automobile factory. They will manufacture the American Everett machine ; every part will be manufactured under one roof. This will mean a big opening for high class mechanics.

The town is installing, through Engineer Willis Chipman, of Toronto, a modern sewerage plant, and will commence this summer to reconstruct the waterworks system. It will mean about $150,000 expended on this work.

J. B. Tudhope, president of the Carriage Factories, Ltd., has made a request for about 75 houses to be constructed during the summer, to take care of the large number of mechanics that they will have to bring in to work in their new automobile plant. This work will be taken care of by a number of builders of the town.

The contract for the construction of the Orillia to Coldwater section of the C.P.R. will be let shortly. The C.N.R. will use these tracks into Orillia from Atherley, entering the Union Station with the C.P.R. at the foot of Mississaga street, in the heart of the business section of the town. The building of the bridges over the Narrows at Atherley, and construction throughout the town, including yards and station, will amount to about $500,000, all which is to be completed by November.

CATALOGUES.

NOTES ON HIGH SPEED STEEL, SAWS, DRILLS, ETC.—Is the title of a compact little booklet being distributed by Alex. Gibb, Montreal. While particularly referring to Beardshaws "Conqueror" brand steels it carries several interesting pages on "The Treatment of Ordinary Crucible Steels." Hints and suggestions are given pertaining to forging and heating for ordinary tool steel ; hardening of ordinary carbon steels ; tempering steels. Those who are already using "Conqueror" steel will find this a handy little booklet and those using other brands will be materially helped by having one available. A copy will be sent for the asking.

BAILEY FURNACE.—A neat catalogue issued by Geo. J. Hogan, 401 Peoples Bank Bldg., Pittsburg, Pa., describes the Bailey combination sheet and pair furnace. Illustrations show the furnace equipped with American automatic Underfeed Stokers and the Stoker Attachment is fully described.

TAPS, DIES AND REAMERS.—Butterfield & Co., Rock Island, P. Q., manufacturers of taps, stocks, dies, screw plates, reamers, etc., have issueh a 1910 catalogue of 90 pages, 6" x 9", on coated paper, illustrating and describing their lines. The different standard threads are shown including the U.S., International and French, sharp V, Whitworth and Acme, Reece's and Derby Screw Plates in all sizes, for all classes of work including automobile repair work are shown. Machinists, blacksmiths' hand taps, etc., are described and pipe cutters, vises and special reamers are also included in the catalogue. Tables of prices are given, the catalogue being a useful and handy book of reference.

VERTICAL TURRET LATHE.—Pamphlet V-16 describes the vertical turret lathe manufactured by the Bullard Machine Tool Co., Bridgeport, Conn., for machining automobile and gas engine parts.

You haven't derived all the benefit possible from this number of "Canadian Machinery" unless you have read every advertisement!

THE Advertisements are news—news of vital importance to every manufacturer, superintendent and mechanical man.

¶ The advertiser pays for the privilege of telling you of his products through our advertising pages. The old-time style of exaggeration in advertising is not now used by the progressive manufacturer—he cannot afford to make a statement that he cannot back up in actual practice.

¶ Because he has confidence that his product is as good or better than his competitors', he makes a public statement where it can be read by both competitors and possible customers alike.

¶ He may not be able to give you full information this month—his space is limited—next month and the month after further particulars will appear.

¶ The manufacturer of machine shop and foundry equipment spends a great deal of time and money in developing his product, and bringing it to perfection—it is his life-study to turn out money-saving devices, and he stands ready to give you the fullest possible information.

¶ Read what he has to say through his advertising—**it may suggest a means of saving money in your plant**—then write for full information.

Pattern Making

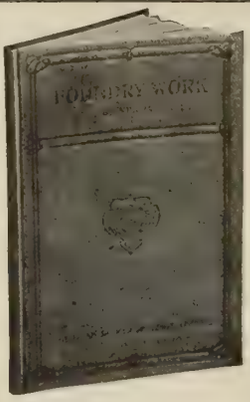
By James Ritchey

Instructor in Wood Working Armor Institute of Technology

160 pp., 250 illus. Cloth binding. An extremely valuable working guide for Wood and Metal Workers, Molders, etc. The various tools and machines used in wood working are fully described and illustrated, as are also the different methods of building up and finishing patterns and of molding. The three divisions are Materials and Tools; Methods of Molding; Simple and Built-up Patterns.

Price, $1.00

Given free with two yearly paid-up subscriptions



Foundry Work

By William C. Stimpson

Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables etc.

Price, $1.00

Given free with two yearly paid-up subscriptions

Handbook of Practical Mechanics

By Chas. H. Saunders

New and Revised 1908 Edition, Up-to-date Machinist's Ready Reference Pocket Book for Foremen and Machinists. Many of the tables and valuable Shop Kinks were taken right from the note books of the best mechanics. It contains original tables, formulas and drawings not found in any other pocket manual. Plain, concise directions are given regarding Blue Prints, Cams, Cone Pulleys, Lathe Work Problems, Screw Threads, Taper Sockets, change Gears for Spiral Milling, Milling Cutter, etc.

Price $1.00, Postpaid

Given free with two yearly paid-up subscriptions

Mechanical Drawing

By Ervin Kenison, S.B.

Instructor in Mechanical Drawing, Massachusetts Institute of Technology

176 pp., 140 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates.

Price, $1.00

Given free with two yearly paid-up subscriptions

You will find a little work on your part will easily secure for you any one of the above books. Just show your friends a copy of "Canadian Machinery" and tell them how well you like it.

HAVE A PLAN. The man who is satisfied with what comes to him unsolicited answers few knocks at the door. The stay-at-home misses daily opportunities that pass at the next corner. Get away from the desk—get out of the chair-tilting class. Opportunities are in perpetual motion. Get after them. Lay out a plan, a campaign for new business—then go after it. Exhaust every source, swing every prospect into line. Don't be satisfied with the business that you have—get more.—System.

STRETCHING THINGS

I am mighty careful not to stretch the facts in these publicity efforts.

You see, I base all my statements from information received from practical foundrymen, who know the subject.

I have reports from more than fifty progressive Foundrymen who say my KING KORE KOMPOUND is a new era in economy, in investment of money, in time-saving and in saving of castings. If there is now any one whose detail differs from the majority, I make it to fit his case.

It's the same way with GENUINE EAST INDIA PLUMBAGO, the only Lead any foundryman can afford to use.

With the Core Compound goes STEVENS' CARBON BLACKING, the ideal core-wash; there is no trouble, when making hollow castings, with this combination.

I manufaoture FOUNDRY FACINGS, FOUNDRY SUPPLIES, BUFFING COMPOSITIONS and PLATERS' SUPPLIES.

MANUFACTURERS OF

Crucibles of Quality

Mr. Brass Foundryman:

Quite a number of Brass and Iron Foundrymen are using our Detroit Core Compound in as high a ratio as 75 of sand to 1 of Compound, and producing cores which are quite open, which do not blow, and readily rap out of the casting.

Ask the Empire Mfg. Co., of London, they use it and are saving money by so doing. A sample for the asking.

We manufacture Tripoli, Lime Compositions, Coloring Compositions, Polishers' Friend, Emery Cake, Rouge, etc.

Formed Saws for Slitting Copper

These saws are designed especially for the slitting or sawing of metals that are of a soft or tenacious character and are superior to the ordinary saw usually employed for this purpose. The teeth are formed and backed off the same as in all formed milling cutters, and are sharpened by grinding the face, thus retaining the outline of the saw. The sides of the saw are ground concave for clearance.

These saws are made to order.
